Increases occurred in the small cities and in the very large cities with over 1,000,000, population. The medium sized cities reported decreases. They had been the principal centers of war production and therefore experienced the greatest conversion difficulties, including strikes.

EQUIPMENT

The number of new transit vehicles of each type—street cars, buses, trolley coaches—delivered in 1946 is shown in the table below. While it is the largest number on record, it fell far short of the requirements of the industry. At the beginning of the year, the vehicle manufacturers planned and expected to deliver more than 16,000 new vehicles. The record shows they delivered only half of that number. Strikes and shortages of materials were responsible.

Inability to get all the new vehicles it needed and the further difficulty in getting the parts required to keep its older vehicles running steadily, was a serious handicap to the transit industry throughout 1946. It was unable to make the improvements in service that had been planned. While the wartime standards of service had been greatly improved, there was still overcrowding of vehicles in some places, and transit managers were subjected to a good deal of undeserved criticism. Traffic continued at wartime levels or higher, but many transit companies could get only enough new equipment to retire their oldest wornout vehicles and were unable to increase their service. Improvement in this situation is expected in 1947 as manufacturers increase production, but all transit equipment requirements will probably not be satisfied much before 1950.

LABOR

Wages and labor relations continued to be the number one problem in 1946. With the termination of government control, relations between management and union reverted to straight collective bargaining, and with the return of personnel from the armed services the managements strove to restore peacetime working conditions and eliminate excessive overtime, while the unions strove to maintain the workers' wartime take-home pay and to increase it despite the reduction in working hours. As a result, hourly wage rates soared. Further than that, total labor costs increased substantially and threatened to absorb a disproportionate share of the transit dollar of receipts. In 1946, the transit payroll increased 12 per cent and absorbed 51 per cent of operating revenues.

So long as transit traffic holds up or

ANNUAL TRANSIT VEHICLE PRODUCTION

* Preliminary estimate.

continues to increase, it is possible that it may continue to support its present wage structure. When traffic turns down, however, as it is bound to do at some time in the future, the situation will be serious. Transit managements are acutely conscious of the situation and are casting about for some means to alleviate it. Efforts are being made to reach some understanding with labor that will make possible an amicable adjustment of wages to the ability of the industry to pay when and as it becomes necessary.

There is some evidence that labor is also aware of the precarious nature of the situation and has been giving some thought to it. A recent editorial in a union paper pointed out to its readers that their future well-being depended upon transit's continued ability to maintain its earning power and that increased productivity on the part of the workers was essential to it. If this means what it implies, such a spirit of understanding and cooperation on both sides may make it possible for management and union labor to work out a satisfactory solution of their common problem.

FARES

Thirty-five companies were compelled by rising costs, declining revenues, or a combination of both, to raise their fares in 1946, and there were a number of applications for increases pending at the end of the year. While transit traffic as a whole increased in 1946, the traffic of many individual companies declined, in some instances quite sharply, owing for the most part to especially critical local conditions arising in the transition from war to peace. The experience of these companies is probably symptomatic of what may be expected on a larger scale if there should be a general decline in traffic. A general increase in fares would be the logical result.

It is of interest, and possibly of some significance, to note that three of the five principal municipally owned and operated transit systems in the United States are included in the group that raised fares in 1946. New York engaged in a heated debate concerning subway fares, and the decision was against an increase. These municipal systems have had to pay the highest wage rates in the country. It is not surprising, therefore, that they should also be among the first to raise fares or attempt to do so. Conditions that forced fare increases on municipal properties exist also on private properties, and the latter may be forced to follow the same course.

PUBLIC RELATIONS

During 1946, the Transit Industry for the first time, after 15 years of effort, was able to unite on a national effort for the entire industry. The medium was radio, and the vehicle originally selected was "Spotlight on America," a dramatization of human incidents in the news.

Transit's national radio program was presented over the coast to coast facilities of the Mutual Broadcasting System with an original sponsorship of 45 transit companies stretching from Boston to Honolulu. The list has been substantially increased since the first program was presented. The sponsoring companies operated 34 per cent of all transit vehicles in the United States.

The radio program had two national commercials each week, dealing with subjects of universal application to every transit company irrespective of size, type of operation, or geographical location. It also included a 60-second station cut-in commercial supplied by each company and delivered by the announcer of the local station, dealing with matters of purely local importance.

The national radio program has been a good start, but only a start, in presenting the problems as well as the sales advantages of the transit industry to the people of America. It does represent, however, the first step in bringing the industry together in a concerted attack both on the misinformation which causes concern to all transit properties, as well as on those problems which can best be solved by the combined efforts of a united industry.

USE OF RADIO IN TRANSIT OPERATIONS

As time goes on, more and more effective use of shortwave two-way radio facilities is being made by transit operating companies to speed trouble-calls and otherwise to maintain and improve service. At the present time, more than 30 transit companies are using radio for such purposes, and it is anticipated that additional companies will take advantage of this modern aid to supervision as soon as radio equipment for such service becomes more readily available.

In 1938, the Federal Communications Commission gave official recognition to the needs of the transit industry by permitting the use of so-called special emergency stations.

In 1943, development in the art of radio and other circumstances made it necessary for the FCC to reopen the entire frequency allocations plan. The transit industry obtained recognition of its needs for broadened radio facilities as being in the public interest. On Sept. 9, 1946, the Commission made available a new class of radio station for transit utilities, on frequencies to be shared only with other services which operate primarily outside urban areas so that there should be a minimum of interference.

DEVELOPMENT OF OBJECTIVES IN MOTOR COACH DESIGN

Committees within the transit industry, representing all interested groups. have been active for several years in the development of improved motor bus equipment for urban service. Beginning early in 1944, it was felt that an expression of the views of transit operating companies on the design and equipment of post-war models of buses, based on the experience of these companies in the operation and maintenance of current models, would be most helpful and should be brought to the attention of the bus builders.

Two years' cooperative work by groups representing both the maintenance and the operating departments of transit companies, together with representatives of manufacturers, has resulted in a comprehensive statement of "Objectives" which has been of material assistance to the manufacturers in their efforts to provide what the industry wants. All of the Objectives have by no means been achieved, but there is evidence that serious efforts are being made to accomplish most of them in the shortest possible time. Current models of buses now coming off the assembly lines incorporate many of the Objectives.

SERVICE IMPROVEMENTS

Transit management is keenly aware of its responsibility to improve service and experimented during the year with various forms of service designed to meet the needs of the public better. Transit companies in some cities are now providing express bus service on certain routes with substantial time-saving to passengers in traveling between residential and business districts. The inbound express buses are operated with local stops at the outer ends of the lines to take on passengers. Then at designated points the buses run express to the downtown business districts, where they operate locally to discharge passengers.

The time-saving with this improved type of service is sufficient to attract many people who have been accustomed to use their automobiles to and from downtown districts, thus contributing to the relief of traffic congestion.

Transit companies in several cities are also experimenting successfully with parking lots located on the perimeters of the downtown districts and with special bus services between the parking lots and shopping and other business centers. Usually, patrons purchase a combination ticket covering the parking charge and the round-trip bus ride.

Experience indicates that, if such parking facilities are properly located with respect to the main arteries leading into the center of a city and a satisfactory bus service is provided, the number of automobiles in and out of the business district can be materially reduced.

THE MERCHANT MARINE

By John C. Niedermair
Bureau of Ships, Navy Department

SHIPBUILDING CONTRACTS

In January of 1946, it was expected that some of the most important shipbuilding contracts ever placed in the United States would be awarded during the year. The principal contracts pending at that time were for large high-speed passenger-carrying ships, combination passenger and cargo ships, intermediate size tankers, and special design cargo vessels. However, as the year progressed, the national policy was changed by President Truman to one of extreme economy with regard to expenditures for new merchant shipbuilding. There were in existence on Jan. 1, 1946, shipbuilding contracts for private American operators covering 62 large ships of 479,136 gross tons and 622,350 deadweight tons, with propulsion machinery totaling 502,250 horsepower. Seventeen of these ships were combination passenger and cargo carriers, 13 were all-refrigerated cargo ships, and 25 were cargo ships. All these ships were to be completed during the year. The number of vessels under contract by January, for both private interests and the United States Maritime Commission, totaled 507 vessels of all types, representing 1,038,000 gross tons and 1,500,000 deadweight tons.

SHIP PRODUCTION

As the final complete records for 1945 became available, it was noted that for the fourth successive year the production of large steel merchant vessels in the United States exceeded in number and tonnage all previous pre-war annual shipbuilding records. The total produced during 1945 was considerably less than the record-breaking year of 1943. It will be noted from the table that 1,041 steel self-propelled merchant vessels of over 2,000 gross tons each were completed and delivered in 1945. The combined tonnage of these vessels totaled 7,614,898 gross tons and 10,304,644 deadweight tons, and the propulsive plants totaled 5,964,180 shaft horsepower. The tremendous wartime merchant shipbuilding program was completed by January 1946.

American shipyards produced, during the four war years, 1942-1945 inclusive, the grand total of 4,889 steel merchant vessels of over 2,000 tons each. The deadweight capacity of these vessels was 52,875,603 tons, the gross tonnage totaled 36,896,538 tons, and the aggregate shaft horsepower equalled 21,598,100. The production record for these four years was as follows:

	Cargo Ships	Pass.-Trans-ports	Tankers	Total
1942	652	11	61	724
1943	1,410	20	231	1,661
1944	1,175	48	240	1,463
1945	807	46	188	1,041

In contrast the shipbuilding production record from Jan. 1 to Dec. 1, 1946 was 76 vessels totaling 594,088 gross tons and 870,818 deadweight tons.

THE RECONVERTED *AMERICA*

During the year many conversion jobs were completed. The most outstanding job of this nature was the conversion of the United States Lines transatlantic liner *America* from her wartime service as a transport. This vessel was originally delivered to the United States Lines on July 27, 1940 when she was widely acclaimed as setting a new standard of safety, comfort, and luxury. On June 15, 1941 the U. S. Navy commissioned the ship as a "Convoy Unit Loaded Transport," named *USS West Point*. As a transport, the ship had facilities for over 8,000 troops, an anti-aircraft battery of 28 tons, with attendant ammunition stowage and other wartime features. The *America's* war record included 27 Atlantic crossings between June 27, 1944 and June 24, 1945 and during this time she carried more than 140,000 passengers. During her wartime service, the *America* traveled over 436,000 nautical miles and carried more than 500,000 passengers. No structural defects, major or minor, had been reported, and the engines had run since 1941 without being overhauled by a shipyard. On Feb. 28, 1946 the *West Point's* war work was done and she returned to the Newport News Shipbuilding and Dry Dock Company, her original builders, for reconversion to peacetime service as a passenger liner. On Nov. 14, 1946 the *America* sailed from New York on her first transatlantic voyage as a passenger liner.

THE WORLD FLEET OF MERCHANT VESSELS

A comprehensive survey was made by the Maritime Commission showing the number and tonnage of seagoing steel merchant vessels over 1,000 gross tons each, flying the flag of each maritime nation of the world as of June 30, 1946. The figures covering the total merchant vessels now in existence when compared with pre-war (Sept. 1, 1939) revealed the interesting fact that, while the total number has declined from 12,798 to 12,445, about 4 per cent, the deadweight tonnage has increased from 80,601,000 to 99,220,000 tons, or about 23 per cent. This large percentage of increase in carrying capacity of the world fleet was mostly accomplished in the relatively short period of time encompassed by the years 1940 through 1945, while at the same time great losses in merchant vessels, mainly pre-war built, were being incurred. The tremendous production of large deadweight carrier merchant vessels by the shipyards of the United States during the war years is the main contributing reason why the carrying capacity of the world fleet is now greater than pre-war.

It must be borne in mind, when analyzing the status of the world fleet, that the balance which existed before the war, based upon the law of supply and demand for individual specific types and sizes, has been destroyed because of the necessity for producing during the war large deadweight carriers in great numbers, such as the Liberty type of ship produced in the United States, Canada, and Great Britain. These vessels have a deadweight tonnage of over 10,500 tons. In the years immediately preceding the outbreak of war there existed in international trade and on the deep sea trade routes of the world only about 1,100 cargo vessels of this size or larger. There are now in existence more than 3,500 vessels of this size, clearly indicating a great surplus of vessels in this category, which surplus can not be employed in normal times. This presages the laying up or scrapping of many large vessels in the next few years, as soon as UNRRA and other government shipments cease.

WORLD SUPPLY OF TANKERS

The world supply of tankers has increased sharply, the intensive war building program in the United States and Great Britain being responsible for a 17 per cent increase in numbers and a 31 per cent and 35 per cent increase in gross and deadweight tonnage, respectively, over the pre-war totals; in fact, the tank ships now existing represent 16 per cent of the total number of merchant ships afloat and more than 23 per cent of the total deadweight tonnage. The current world tanker fleet totals 1,981 units of 15,066,295 gross tons and 23,234,600 deadweight tons, whereas before the war the total was 1,700 vessels of 11,485,161 gross tons and 17,235,200 deadweight tons. The total carrying capacity of the current world tanker fleet is far greater than can be employed in peacetime, and many vessels will have to be laid up. Another factor which will force tankers into lay-up or scrapping is the approximately 25 per cent increase in average speed and average deadweight tonnage incorporated in the more than 800 new tank ships constructed during the war, mainly by American shipyards. These will make possible more voyages per year per ship and more oil per trip, thus allowing an operator to move the same tonnage of oil as pre-war with fewer vessels.

WORLD SUPPLY OF DRY CARGO CARRIERS

While the total number of cargo ships now in existence shows an increase of only 6 per cent in number over the pre-war supply, as will be noted from the following table, the total gross and deadweight tonnage has increased by 51 per cent and 39 per cent, respectively.

PER CENT CHANGE IN WORLD TONNAGE BY VESSEL TYPE

(1,000 gross tons and over)

September 1, 1939–June 30, 1946

Type	Per Cent Increase or Decrease		
	Gross Tons	Deadweight	Number
Total	+20	+23	−4
Combination	−48	−51	−50
Combination refrig.	−26	−28	−32
Cargo ships	+51	+39	+6
Refrigerated ships	−26	−28	−28
Bulk carriers	−33	−34	−31
Tankers	+31	+35	+17

Thus, the cargo carrying capacity is far in excess of what could normally be employed. However, with the eventual retirement of a large proportion of the slow-speed large deadweight carriers of the Liberty type, a better balance will be achieved.

A considerable shortage in combination passenger and cargo vessels exists owing to a decrease of 50 per cent in number over pre-war figures. Combination passenger and refrigerated cargo vessels have decreased by 32 per cent, and refrigerated cargo ships show a decrease of 28 per cent in number. Bulk cargo carriers have decreased by 31 per cent in number. Thus, a definite shortage exists in the category of special types of vessels designed for specific purposes, while there is an oversupply of general cargo ships and tankers. The world fleet will be balanced only by the construction of many of these special types and the scrapping or permanent lay-up of the types now in excess. Shipbuilding in foreign countries and in the United States reflects the demand for these special types.

UNITED STATES FLAG VESSELS

The following table shows the shift in national control of merchant fleets during the war period owing to losses and new construction. Now controlled by the United States under the American flag are 4,861 vessels of 35,363,598 gross tons and 50,389,300 deadweight tons. To this total must be added 526 additional vessels of 3,223,571 gross tons and 4,681,500 deadweight tons owned by the Maritime Commission but flying the flag of foreign nations under Lend Lease terms, etc., making a grand total of 5,387 vessels of 38,587,169 gross tons and 55,070,800 deadweight tons. This is 42 per cent of the total vessels afloat in the world and 55 per cent of the total deadweight tonnage.

This great balance of power in favor of the United States, however, can not be but a temporary advantage. It is one thing to own property and another to be able to employ and operate these tools profitably. In a little over one year, almost 1,700 of these vessels were laid up and as UNRRA and other government-controlled shipments decline many additional vessels will be forced into lay-up. A program for scrapping much of this tonnage, involving approximately 1,000 ships, will wipe out of existence almost 25 per cent of the existing American flag tonnage. About 125 vessels have been sold for scrapping since the end of the war.

Source: United States Maritime Commission.

a number of old privately owned American flag vessels were sold to foreign interests in 1946.

Eliminating from the above mentioned grand total of 5,387 American vessels the 2,500 Liberty and 531 Victory ships built during the war, and the 961 tankers under the American flag or on lend lease, a balance of only 1,395 vessels remains which can be called competitive type earning tools. Of these there are only about 750 really high-class dry cargo and passenger liners which could be used on competitive trade routes. These are the vessels American operators will be using to compete with the great tonnage of post-war ships now being constructed in British, Swedish, and other foreign shipyards. Facts such as these will have to be faced by the Maritime Commission in carrying out the mandate of Congress as expressed in the Merchant Marine Act of 1936. The resumption of building of special types of merchant vessels designed to fit the requirements of specific trade routes will be necessary. A well-regulated plan, such as embarked upon before the war calling for the building of 50 ships a year, should be reinstated.

AMERICAN TANKERS

Flying the American flag are 914 tank ships of 8,083,190 gross tons and 12,916,100 deadweight tons. In addition, 47 tankers of 218,420 gross tons and 340,400 deadweight tons owned by the United States Government are still employed by foreign nations under lend lease terms and flying foreign flags, making a total of 961 tankers of 8,301,610 gross tons and 13,256,500 deadweight tons. This represents 48 per cent of the total world supply of tankers by number 55 per cent of the gross tonnage and 57 per cent of the deadweight tonnage, whereas prior to the war there existed under the American flag about 25 per cent of the total number and tonnage of the tankers then in existence. The fleet then totaled 403 vessels of 4,477,100 deadweight tons. A number of these pre-war built tankers have been sunk and others scrapped.

At the moment the United States has the finest and largest tanker fleet ever to exist, with a higher average speed and a greater average carrying capacity than any other national tanker fleet. However, this total American flag tanker fleet is more than twice as great in number and three times as great in deadweight tonnage than the fleet that could be profitably employed before the war, most of which fleet operated in the domestic trade and comparatively little internationally. With a 25 per cent increase in average speed and average carrying capacity, this new American tanker fleet has a yearly transportation capacity far greater than could ever be utilized. However, a few tankers will be sold abroad, but not enough will be disposed of in this manner to avoid a large percentage being laid up. More than 350 tankers are now in the government laid-up fleet sites. Some few tankers are being sold for scrapping, but many more of the old pre-war vessels will have to be disposed of in this manner.

AMERICAN DRY CARGO VESSELS AND PASSENGER LINERS

The American flag combination passenger and cargo vessels have shrunk from the pre-war figure of 170 of 1,390,640 gross tons to 95 of 942,483 gross tons, including those now out on lend lease and combination passenger and refrigerated vessels. This is an important type of vessel in any large national merchant fleet for commercial purposes and for national defense and offense. The deficit existing in the American flag fleet will not be made up by the few passenger ships now being constructed or by the few large liners projected by the Maritime Commission. Emergency conversion of large cargo vessels to troop transports during the war temporarily answered the purpose but were far from ideal in troop capacity and speed of transport. Large British, French, and Italian liners had to be employed for the transportation of American troops in the recent war, though not to the same extent as in the First World War.

Refrigerated cargo vessels under the American flag have increased from a pre-war figure of 29 of 128,182 gross tons and 145,800 deadweight tons to 52 of 273,197 gross tons and 303,700 deadweight tons, more than doubling the carrying capacity available. Additional vessels are now being constructed which will increase these totals slightly.

American flag bulk carriers have increased in number and tonnage from the pre-war figure of 67 vessels of 326,670 gross tons and 569,900 deadweight tons to 94 vessels of 473,467 gross tons and 794,000 deadweight tons, including those under foreign flag on lend lease terms. It is doubtful whether American interests can employ this greatly increased amount of bulk cargo tonnage in normal times. However, some few old ships of this type are scheduled for scrapping.

The great increase in American flag tonnage has occurred in the general cargo ship types. Before the war there were 763 American cargo ships of 3,814,804 gross tons and 5,828,600 deadweight tons. There are now 4,186 vessels of 28,596,415 gross tons and 40,093,300 deadweight tons, including those operating under lend lease by foreign nations. This is an increase of 3,423 vessels and over 34,000,000 deadweight tons. However, this segment of the American merchant marine will eventually be reduced through the sale to foreign flags, scrapping and permanent lay-up so that the total will again approach the pre-war figure. The comparatively few C-type standard cargo ships will be the main components of the American flag cargo ship fleet unless the Maritime Commission resumes its pre-war 50 ships a year building program.

BRITISH FLAG AND OTHER NATIONAL FLEETS

Approximately three-quarters of the world merchant vessels are now owned or controlled by American and British interests. The great fleets previously operated by German, Japanese, Italian, Norwegian, and French interests have been largely destroyed. The fleets of the three Axis powers at present are negligible and probably will continue so for some years to come. The fleets of the Allied powers, except the United States, and of neutrals were badly depleted during the war and can only be restored over a period of years. However, the merchant fleets of Sweden and Russia show an increase of 8 and 60 per cent, respectively, in deadweight tonnage. The increase in the Russian fleet is owing to the acquisition of Axis power tonnage.

At present the British Empire fleet totals 2,818 vessels of 16,055,408 gross tons and 21,167,400 deadweight tons, excluding American-owned tonnage being operated under lend lease. This compares with a pre-war total of 3,424 vessels of 18,023,953 gross tons and 24,174,000 deadweight tons. However, British shipyards are now operating at a rate variously estimated to produce 1,500,000 to 2,000,000 gross tons per year of special types, and the pre-war figures should soon be matched.

STATUS OF DOMESTIC DRY CARGO SERVICE

The National Federation of American Shipping in a recent report stated that unless the Interstate Commerce Commission acted promptly to establish compensatory tariffs which will attract domestic shipowners to re-establish former services, the domestic shipping trade will be destroyed. The

Federation stated that practically all dry cargo vessels now employed in domestic shipping are owned by the United States Maritime Commission.

The Federation considers it doubtful that the domestic shipping vessels will carry as much as 3,000,000 tons of cargo this year, compared to the 24,037,000 tons carried in 1939, by privately owned and operated domestic vessels. The present gloomy outlook for domestic dry cargo operation is owing almost entirely to abnormally depressed and non-compensatory rates. These factors were pointed out by the Senate Commerce Committee in December, 1945, again in March, 1946, before the House Merchant Marine and Fisheries Committee, and in petitions from War Shipping Administration, as well as from many other organizations and individual companies. Meanwhile, the nation is facing one of the most acute transportation crises in history. The reconversion program is being seriously retarded by the lack of transportation facilities. An important part of this crisis could have been met and solved had domestic shipping been reestablished on a compensatory basis.

As an example of the carrying capacity of domestic shipping, in terms of dry cargo vessels only, the Federation stated that in 1939 private intercoastal shipowners used 148 ships which carried nearly 7,000,000 tons of freight. At present, the Maritime Commission is employing about 40 per cent of that number which may carry less than 2,500,000 tons of freight this year. This is about 30 per cent of the cargo moved intercoastally in 1939, despite the fact that hundreds of suitable ships would be available if the rate structure were such as to attract private shipowners to utilize the vessels.

The coastwise dry cargo service presents an even poorer picture. At present only 10.5 per cent of the number of ships employed in the coastwise trades in 1939 are now in similar service. These 21 vessels may carry substantially less than 1,000,000 tons of cargo this year, compared with the 17,083,000 tons carried by the 200 dry cargo ships owned and operated by private enterprise in 1939.

It was further emphasized that, unless action is forthcoming soon, domestic dry cargo shipping services will be eliminated, and the shipping policies expressed by Congress will be defeated. A significant aspect of this situation is the curtailment of employment for seamen and longshore labor. Employment opportunities in the domestic shipping trades are decreasing in direct ratio to the tons handled. The common outlook for the operators, the union membership and the national defense is therefore a most dismal one.

SALE OF WAR-BUILT SHIPS

A return to the Government of more than $1,000,000,000 on sales of war-built merchant vessels under the Ship Sales Act of 1946 is in sight, the United States Maritime Commission told Congress. The forecast was made in the quarterly report on progress in disposition of the vast fleet constructed between Pearl Harbor and V-J Day, in which Vice Admiral William W. Smith, U. S. N. (retired), chairman of the Commission, stated applications for the purchase of 385 vessels at a total cost of $335,000,000 were approved in the three months ended Sept. 30. With 843 applications already on file still to be acted upon, a total return of more than $1,000,000,000 seems assured.

Of the 385 sales approved 158 ships, including many of the more desirable types, went to American operators, 184 to foreign governments, and 43 to foreign citizens. Most foreign sales have consisted of vessels in large supply, such as Libertys and Victorys. France and Italy have been approved for sale of 75 and 50 Liberty ships, respectively, The Netherlands 45, and Norway 14 of various types. It is expected that within a reasonably short period some 400 ships will be disposed of to American purchasers and 800 abroad.

PACIFIC TRADE ROUTE SUBSIDIES

The largest public hearings to be held in Washington on world shipping since before Pearl Harbor began on Aug. 17, when the United States Maritime Commission launched intensive examination of the needs of American steamship companies for operating-differential subsidies. The hearings dealt with trans-Pacific trade routes exclusively.

The subsidies, suspended since soon after this country entered the Second World War, are authorized under the Merchant Marine Act of 1936 to enable American steamship companies to compete with lower cost foreign competition in overseas commerce. Before Pearl Harbor, 12 operators were engaged in essential world service with the aid of subsidies. These companies are the American Export Lines, Inc.; American Mail Line, Ltd.; American President Lines, Ltd.; American South African Line, Inc.; Grace Line, Inc.; Lykes Bros. Steamship Company, Inc.; Mississippi Shipping Co.; Moore McCormack Lines, Inc.; New York and Cuba Mail Steamship Co.; Oceanic Steamship Co.; Seas Shipping Co., Inc.; and United States Lines. All are eligible for renewal of subsidies as of Aug. 1 upon proof of need for the assistance.

Nine operators have filed applications for operating-differential subsidies, or modifications, or extensions of subsidized services in the Pacific. They are American Export, American Mail, American-Hawaiian Steamship Co., American President, Lykes Bros., Olympic Steamship Co., Oceanic Steamship Co., States Steamship Co., and United States Lines. The Grace Line, Inc., has requested permission to inaugurate a Far East service but has not indicated that it will seek a subsidy.

Several other operators having an interest in Pacific commerce were represented at the hearing as interveners. Among them were the Waterman Steamship Corp., Isthmian Steamship Co., Pacific Far East Line, and Pacific Transport Lines.

In the five years that the operating-differential subsidies were in effect before the war they totaled $49,000,000 of which some $30,000,000 had accrued as recapture to the Government.

COMMERCIAL AVIATION

By Andrew F. Haiduck

General Manager, Duramold Division,
Fairchild Engine and Airplane Corporation

GENERAL

The first full year after the war turned out to be the biggest in the history of commercial aviation, with light plane manufacturing and airline expansion setting the pace. Personal plane deliveries totaled approximately 34,560 in 1946, and certificated domestic and international air carriers flew approximately 7,258,000,000 passenger miles and carried 13,819,000 passengers, up 78 per cent over 1945.

The number of registered aircraft more than doubled in 1946 over 1945, from 37,789 to 85,000. The number of certificated pilots likewise rose from 296,895 to an estimated 400,000. Also in 1946, about 170,000 student pilot certificates were issued as against 77,188 in 1945.

While the effect of the 5-cent air mail rate could not be exactly determined towards the end of the year, the air mail ton-miles for the first nine months dropped almost 50 per cent under the amount for the same period in 1945. During the same interval, however, air express and freight ton-miles rose from a figure of 17,094,780 in 1945 to 23,041,708 ton-miles in the 1946 period, a 35 per cent increase.

Charter non-scheduled operations both in passenger and freight categories increased by leaps and bounds as indicated by the 3,061 air services which applied for operating certificates. Considerable controversy developed towards the end of the year relative to policy and long-range prospects for this young upstart. No statistics were available to measure its meteoric growth.

SAFETY RECORD

The tremendous surge in traffic on regularly scheduled certificated airlines was accompanied by a greatly improved record with respect to safety. Passenger fatalities in 1946 were 147 per 100,000,000 passengers compared to a 1945 rate of 231. However, the first few weeks in January, 1947 witnessed several fatal crashes which caused considerable agitation for increased safety provisions such as radar and ground-controlled approach procedures. In this connection, the annual Collier Trophy Award went to Dr. Luis W. Alvarez for his development of this type of landing procedure under conditions of practically no visibility.

PASSENGER REVENUE

Passenger fares remained substantially at 4½ cents per mile as in 1945. However, the faster transcontinental services using such new equipment as the Constellation commanded an additional premium of approximately 20 per cent. As in the case of crack trains of the railroads, it is expected that the fast through flights will continue to command a premium. For the first time in years, a substantial reduction of passenger load factor was in evidence the first nine months of the year. Whereas the load factor had been 88.76 for the first nine months of 1945, the same period in 1946 showed only a figure of 82.87. Passenger revenue continued to be the largest source of revenue for the airlines. constituting approximately 88 per cent of the total. Air mail represented only 6 per cent of the total revenue, whereas freight and express accounted for 1½ per cent.

PRODUCTION OF PERSONAL PLANES

The manufacture of personal aircraft broke all records for number of planes constructed in October when 4,582 were delivered with a total value of $11,184,000. However, November deliveries dropped to 2,763, and December was even smaller. The total for the year was approximately 34,560 airplanes valued at $1,000,000,000. The greatest number ever produced in previous years was 7,000. The rather sharp reduction in production in the last two months of the year caused considerable speculation relative to the market for personal planes in 1947.

RESEARCH

Basic as well as flight research was directed principally in the direction of guided missiles and supersonic flight. This naturally included power plant research on ramjet, rocket, and jet motors. The predictions include such items as super-rockets with ranges from 3,000 to 5,000 miles, traveling at speeds of 1,000 to 3,000 miles per hour. The first powered flight of the Bell XS-1, a rocket propelled aircraft, marked the first stage in the attempt to reach speeds up to 1,700 miles per hour.

SCHEDULED AIR TRANSPORTATION MILEAGE

Domestic revenue miles flown in 1946 were estimated at 300,000,000 miles, a 43 per cent increase over 1945 operations. The estimated total is derived from the sum of actual operations for the first nine months of the year and an estimate of the last three months' operations. Revenue passenger miles for the year estimated on the same basis totaled over 6,000,000.-000, a 70 per cent increase over 1945. Exactly 96.53 per cent of the 228,010,101 miles scheduled in the first nine months of 1946 were flown. This percentage is somewhat better than the 95.04 per cent for the 1945 period. The 1946 total for miles flown in the first nine months by the domestic air carriers was 240,981,535, a 54 per cent increase over the 1945 figure for the same period, *i.e.* 156,385,140 miles.

Approximately 67,000,000 miles were flown on international routes, an 88 per cent increase over 1945. Passenger miles on foreign extensions reached

1,000,000,000, up 140 per cent over the previous year. International route miles totaled 175,000, an increase of 68,000 over the previous year. Express and freight ton miles increased 175 per cent, whereas air mail ton-miles showed a 30 per cent rise. The 1946 ton-mile figures were, respectively, 24,000,000 and 6,000,000.

The domestic network of airway route miles reached the all-time high of 90,000 miles, an increase of 33 per cent over the 1945 figure of 68,000 miles. As of Dec. 15, 1946, there were 816 aircraft in use, of which 655 were in domestic use and 161 on the international runs. The 816 represents a 65 per cent increase over the 495 in use on Dec. 15, 1945. Seating capacity, however, gained about 125 per cent, reflecting the usage of the larger airplanes, such as the DC-4 and the Constellation. Total number of seats available in December was 25.541 roughly or about 50 per cent of the total predicted in 1945.

PASSENGERS, SCHEDULES, AND EQUIPMENT

The number of revenue passengers carried during 1946 in domestic operations was 13,000,000, an increase of 78 per cent. This sharp gain was registered despite the fact that the 1945 figure was swelled considerably by redeployment of personnel by both Army and Navy. At the end of the year, the seating capacity seemed adequate to handle present needs. Revenue passengers carried on the American-operated foreign extensions reached the figure of 1,000,000, 118 per cent increase. The load factor showed the greatest drop in years when it reached 82.87, a reduction of 5.89 under the figure for 1945. This was to be expected in view of the greater number of seats available. However, it is a vital factor in profitable operations for the airlines, and, no doubt, the days of 90 per cent load factors are gone for some time to come. Revenue passenger miles flown in the first nine months of the year totaled 4,374,692,537, an increase of 81 per cent over the same period in 1945. The average available seats per mile rose in the same period from 19.59 to 24.09, reflecting the usage of the bigger aircraft as well as greater frequency of service. The average revenue passenger load, however, did not go up as rapidly, increasing from a 1945 figure of 17.39 to 19.96 in 1946. The difference between the two sets of figures illustrates again the drop in load factor.

Most of the larger operators put into operation large four-engine airplanes of either the DC-4 or Constellation type for the long transcontinental runs. These airplanes seat 48 passengers, and the Constellation, in particular, makes the transcontinental run in a dawn-to-dusk schedule. A few of the Boeing Strato-cruisers also made their debut in 1946. This plane accommodates 67 passengers in its upper deck and 14 in the lower deck lounge. Performance is such that Chicago is within 2 hours and 30 minutes of New York, and Los Angeles is only 8 hours and 10 minutes from the East Coast. The Martin 202 is scheduled to make its appearance early in 1947. It is primarily a short haul, 30-place airliner for feeder work. In short, the airlines are in the process of gradually replacing their rather old equipment with larger, faster, and more economical transport planes.

AIR MAIL

According to the Air Transport Association, air mail was off about 50 per cent in 1946 with a figure of 32,000,000 ton-miles, as war volume disappeared. However, a substantial increase in usage of air mail was evidenced in the last quarter with the advent of 5-cent air mail. Actual mail ton-miles flown in the first nine months added up to 24,554,020, compared with 50,541,985 in the same period in 1945. The average mail load dropped from 681.1 pounds to 218.4. Air mail on foreign extensions of our airlines, however, increased approximately 30 per cent, the estimated ton-miles being 6,000,000 for the year.

Air mail represented about 6 per cent of all operating revenue of the airlines in 1946, whereas it was 16.6 per cent in 1945. This indicates the decreasing importance volume-wise of air mail in the airline revenue picture. It is apparent now that the air mail growth of the last few years was owing largely to the exigencies of war. It is believed that the 5-cent air mail rate will be attractive enough to broaden the use of air mail on a considerable scale. However, two airlines have already requested higher mail pay, citing progressive increases in cost of labor, materials, equipment and fuel. It was their contention that the institution of the 5-cent rate only partially offset the post-war slump in air mail.

AIR EXPRESS AND CARGO

Air express and cargo carried by domestic carriers increased 57 per cent with the year's total ton-miles standing at 37,000,000. Foreign extensions added 24,000,000 ton-miles to this picture, representing 175 per cent increase over the 1945 operations. The exact figures for express and freight ton-miles for the first three quarters of 1946 and 1945 were 23,041,708 and 17,094,780 ton-miles, respectively, despite average express and freight loads of 202.7 pounds and 227.9 pounds for the same years. Air express flown by domestic carriers accounted for 3.5 per cent of all revenue.

During 1946, several independent non-scheduled cargo operators aggressively started to move into this field in a big way. Whereas express and cargo was only a very small part of the certificated operator's revenue, it became the one and only source of revenue for the newcomers. The net result was that one of the cargo non-scheduled operators carried as much as 2,000,000 ton-miles in 5½ months of operation. The year-end saw the development of considerable competition between the regular scheduled operators and the non-scheduled operators in the cargo field. The indications are that the purely cargo operators may be by far the most efficient, and it seems they are here to stay.

FARES, REVENUES, AND EXPENSES

Passenger fares remained at the 4½ cent per mile base established in 1945, although it is expected that premium fares will be used when the new airplanes, like the DC-6 and the Rainbow, are put in service. This will be very similar to the extra fare arrangements now used by the railroads on their crack schedules. Table II shows in summary form the operating revenue and expense statistics of the 20 domestic carriers for the first 8 months of the year. It will be noted that the total operating revenue for the period increased from $139,990,477 in 1945 to $200,802,799 in 1946, an increase of approximately $61,000,000. During the same period, however, the operating expenses increased $87,000,000, resulting in a decrease in net revenue of $26,000,000 for 1946. Ten of the 20 operators were in the red, some so much so that refinancing was their most acute problem.

Analyzing the breakdown of operating revenue, it is noted that 88.8 per cent of the total is derived from passenger transportation. Mail and express account for 6.5 per cent and 3.47 per cent, respectively, with the balance of 1.23 for miscellaneous. The same figures for the 1945 operations were, respectively, 76.2 per cent, 16.5 per cent, 5.6 per cent, and 1.6 per cent, indicating the sharp increase in the proportion of passenger revenue.

Reference to Table II will show that the total operating expense increased almost 80 per cent over the 1945 figure. Flying operations account for $45,309,194 of the total of $196,610,042 or 23.1 per cent. The next largest item of expense is $37,401,088 for ground operations, corresponding to 19 per cent. Traffic and sales, and flight equipment maintenance costs follow with $21,119,643 and $19,285,630, respectively. It is evident from detailed study of Table II that the profit position of 50 per cent of the airlines was somewhat precarious. In fact, two of the smaller operators were almost at the point of ceasing operations at the end of the year. The airlines face 1947 with the knowledge that operating expense must be reduced if they are to show a profit.

TABLE I. **DOMESTIC AIR CARRIERS** (Release of Mileage and Traffic Statistics for 9 Months ended Sept. 30, 1946 and Sept. 30, 1945[1]

			Mileage					
		Miles Scheduled	Scheduled Miles Flown		Other Revenue Miles	Total Revenue Miles	Non-Revenue Miles	Total Miles Flown
			Percentage	Number

---

[1] Effective Jan. 1, 1946, all revenue traffic statistics are reported on the basis of direct airport-to-airport distances. For the purposes of comparability those traffic statistics reported prior to that date on the basis of course flown distances have been converted to reflect direct airport-to-airport distances.

[2] Commercial operations were inaugurated by Essair Aug. 1, 1945. Corporate name changed to Pioneer Air Lines, Inc., June 17, 1946.

[3] The total of all carriers for the 9 months ended Sept. 30, 1946, reflects data for Eastern for the 9 months ended Aug. 31, 1946, due to non-receipt of this carrier's Form 2,780 report for September 1946.

[4] Includes data for Eastern for the 8 months ended Aug. 31, 1946 in lieu of the data for the 8 months ended July 31, 1946 used in the August 1946 Public Release, because of the delinquent filing by this carrier of Form 2780 report for August 1946.

AIRPORTS AND AIRWAYS

On Jan. 1, 1946, there were 1,509 commercial fields, 1,220 municipal airports, 216 C.A.A. intermediate, and 1,081 Army, Navy, or miscellaneous fields. More than 1,000 of these airports were equipped for night flying operations.

The Federal-Aid Airport Act was passed in 1946 and under it the Civil Aeronautics Authority has available $33,000,000 for spending on airports in the continental United States in the fiscal year ending June 30, 1947. The first annual National Airport Plan submitted to Congress under this act tendered aid only to Class I, II, and III airports, *i.e.* fields suitable only for private flying, charter, or feeder line operations. A Class I field has runways 1,800 to 2,700 feet long; Class II—with runways 2,700 to 3,700 feet long; and Class III—with runways 3,700 to 4,700 feet long. Approximately 800 airports will be involved in this program. A total of 385 new airports will be constructed, 412 will be improved, and three new seaplane bases will also be constructed.

Considerable difficulty was experienced during the year with questions relating to state *versus* municipal control of the funds available for the airport program. Several airports were equipped with I.L.S. or G.C.A. blind landing systems for bringing in aircraft under conditions of no visibility. Towards the end of the year the latter system was instrumental in landing several aircraft under conditions which would have normally been considered impossible. The spectacular nature of these cases which might have been major crashes resulted in acceleration of the demand for more of such installations.

AIRCRAFT MANUFACTURE

Approximately 34,500 personal aircraft were constructed by 14 manufacturers in 1946, an all-time record. Piper Aircraft led the field with a total of 7,780 aircraft produced in 1946. Aeronca followed very closely with 7,555, and Cessna third with 3,959. Fourth, fifth, and sixth places went to Taylorcraft, Erco, and Luscombe with 3,151, 2,503 and 2,490, respectively. All of the above airplanes were of the two-place type with power ranging from 65 to 100 horsepower. Seventh place went to Stinson with 1,456 four-place airplanes. Production towards the end of the year showed a sharp drop in the two-place airplanes. In fact, there were more three- and four-place airplanes on order in December than there were for the two-place type. However, there was some indication in December that the market saturation point was slowly being approached.

In addition to the personal airplanes, there were approximately 600 transports and 1,400 military aircraft produced. The entire industry employed about 150,000 persons at the end of the year. Most production schedules were cut back, and it is expected that 1947 will not see as many airplanes produced as the record year 1946.

SONIC RESEARCH

The most spectacular, as well as significant, development of the year in research was the first powered flight of the XS-1, a rocket powered airplane designed to penetrate the compressibility barrier in the region of speeds of sound. Designed for a supersonic speed of 1,700 miles per hour, this airplane is a flight test article for the investigation of those regions beyond the speed of sound. Powered with four 1,500-pound thrust rocket engines, the plane was launched from a B-29 and attained a speed of 550 miles per hour for a short space of time. The airplane will be used for the systematic determination of turbulence phenomena in the transonic range preparatory to the attempt to reach maximum speeds. It has been found that a special windshield will be necessary since air friction at the speeds already flown would raise the temperature close to the melting point of glass. The final attempt to break through the sonic barrier may be made by remote control of the XS-1 with photographic observation of the actual trials.

GUIDED MISSILES

Practically most of the research activity was directed at problems related to transonic and supersonic speeds of aircraft. Also at the head of the list were those problems related to guided missiles. This included developments in rocket engines, jet, and ramjet powerplants. Missiles with ranges of 8,000 miles are not too far distant, according to latest indications.

GROUND CONTROLLED APPROACH

The Collier Trophy awarded annually for the outstanding performance in aviation went to Dr. Luis W. Alvarez for his development of G.C.A. (Ground Controlled Approach), a system for landing aircraft under conditions of no visibility. The system has been in use by the Army and Navy under a cloak of secrecy for some time. Numerous landings have demonstrated its capabilities. In this system, the progress of an airplane is followed on a radarscope on the ground, which locates the airplane both in elevation and azimuth. The plane is picked up at a distance of 30 miles by a search beam and guided in by verbal instruction from the scope operator into a 10-mile precision range. On this viewer is indicated both the glide path and the relation of the airplane to the centerline of the runway. Proven by numerous landings, the system has already been adopted by one of the major air transport operators as an additional safety factor.

OTHER RESEARCH

Research is also being conducted along the lines of a completely automatic landing procedure, relieving the pilot of the responsibility almost entirely.

The search for light, yet strong, materials continued with considerable emphasis on the low density core sandwich type of construction. One of the newest high speed fighters was constructed almost entirely of this type of construction. The need for wrinkle-free construction in the new high speed aircraft mitigates against the usual thin skin type construction. The low density metal faced sandwich type of materials developed offers considerable promise.

The remote control of aircraft by radar was demonstrated in the Bikini Crossroads Project. An automatic ground tracking device has been developed which automatically follows and records the position of any aircraft in flight. The same arrangement was also used to direct the plane, even though it was not even in sight. It is expected that many applications of radar will continue to be the order of the day for many years to come.

SOCIAL AIMS AND CONDITIONS

DIVISION XIV

POPULATION AND MIGRATION

POPULATION STATISTICS

By Leon E. Truesdell
Chief, Population Division, U. S. Bureau of the Census

POPULATION GROWTH

The population of the United States on July 1, 1946, including persons in military service abroad, was estimated at 141,205,806. This figure represents an increase of 1,584,375, or 1.13 per cent, over the estimate for July 1, 1945. This increase is about the same as the increase in the two preceding fiscal years, and materially less than the increase of 1.36 per cent in 1943, which was the largest recorded for any recent year. These estimates are presented for July 1 of each year, from 1940 to 1946, in Table 1, together with estimates for each month of 1945. The estimates of population for dates subsequent to the 1940 Census are based on statistics of births, deaths, and net immigration, which are also presented in Table 1. The data for births and deaths have been adjusted for under-registration, and the figures for deaths include both combat and non-combat deaths of service men overseas. The immigration figures represent net arrivals in continental United States, including arrivals from territories and possessions, which amounted to about 40,000, mainly from Puerto Rico, in the year ended July 1, 1946.

The population estimated for July 1, 1946 represents an increase of 9,536,531, or 7.24 per cent over the 1940 census figure. The increase in slightly more than six years since 1940 thus exceeds by more than 500,000 the entire increase of 8,894,229 between the censuses of 1930 and 1940.

The chief source of the accelerated rate of population increase has been the wartime rise in the birth rate. Though the birth rate declined somewhat between 1943 and the early part of 1946, the level is still considerably higher than at any time between 1930 and 1940, and it bids fair, as indicated later, to reach a level in 1946 and 1947 even higher than that of the high point in 1943. The total increase in population between April 1, 1940, and July 1, 1946, is made up primarily of the excess of births over deaths, which amounted to 8,750,751, though net immigration contributed 785,780, including figures approaching 200,000 in each of the last two fiscal years included in the period. Immigration is thus becoming more important as a source of population growth as compared even with the earlier years of the post-censal period, and in particular as compared with the decade 1930-40, during which total immigration was exceeded by total emigration.

The figures representing net civilian immigration, as shown in Table 1, result from computations involving arrivals and departures of citizens as

[2] Preliminary figures.

well as aliens. The data may be considered in three groups: (1) Alien immigrants and emigrants; (2) alien non-immigrants and non-emigrants, the latter comprising mainly government officials, temporary visitors, and persons in transit; and (3) citizens of the United States. The first group is the smallest both in gross movement and in net resultant. Figures for the whole period from April 1, 1940 to July 1, 1946, are as follows:

Arrivals	2,368,750
Immigrant aliens	295,579
Non-immigrant aliens	755,576
Citizens of the United States	1,317,595
Departures	1,582,970
Emigrant aliens	62,045
Non-emigrant aliens	552,954
Citizens of the United States	967,971
Excess of arrivals over departures (net immigration)	785,780
Immigrant aliens	233,534
Non-immigrant aliens	202,622
Citizens of the United States	349,624

Estimates of the civilian population, that is, the population excluding persons in the armed forces, for July 1 of each year from 1940 to 1946 are presented in Table 2, with the increase from one year to the next, together with figures representing the number of persons in the armed forces. The figures in this table show the effect of the military induction program on the civilian population, that is, the population from which had to be drawn workers for the defense and war production programs. The net decreases in the civilian population represents the excess of inductions over natural increase plus immigration. The military forces reached their maximum around midyear 1945, and during the year preceding this date their growth had been slowed down enough so that the civilian population showed a considerable increase during the year ended July 1, 1945. Subsequent to this date which falls in the period between V-E Day and V-J Day, the process of demobilization was very rapid. Mainly through the absorption of ex-service men, the civilian population increased between July 1, 1945 and July 1, 1946 by 10,845,685, in sharp contrast with the record for the year ended July 1, 1943, during which the civilian population decreased nearly 3,500,000 by reason of the rapid inductions which took place during that year. Between July and December. 1946, the number of persons still in the armed forces decreased from nearly 3,000,000 to somewhat less than 2,000,000.

All of the estimates in Tables 1 and 2 are presented to the last digit, as computed, instead of being rounded, not because they are assumed to be accurate to the last unit, but for convenience in summation.

BIRTH AND DEATH RATES

As already indicated, the recent rise in the birth rate has been the principal factor in the acceleration of the rate of population growth. During the calendar year 1945 there were 2,907,126 births, including an adjustment for under-registration. This number is materially smaller than the maximum of 3,158,593 recorded for 1943, and somewhat smaller than the figure for 1944, though it is still decidedly higher than the average of about 2,400,000 which prevailed during the decade of the 1930's. The rate prevailing in 1945 was approximately maintained during the first half of 1946, according to preliminary monthly totals, but these monthly figures indicate a rapid increase beginning with July, 1946, with rates for registered births in October and November representing annual rates well in excess of 28, or more than 50 per cent higher than the rate prevailing in the first half of the year, or in the year 1945. This increase in the number of births followed somewhat similar increases in the number of marriages recorded about a year earlier; and the statistics on marriages (see discussion below) indicate that high birth rates are likely to be continued at least through the year 1947.

While the birth rate in recent years has been relatively high, the death rate has shown little increase over the average for the preceding ten years. Even military mortality, which amounted in total to around 300,000, was not sufficient to raise the number of deaths in any one year by above 150,000.

The most significant data on births and deaths which are necessary in any study of trends in population growth are presented in Table 3, which gives for each year from 1920 to 1945 the number of registered births and deaths as reported by the National Office of Vital Statistics of the Public Health Service, the annual

rate per thousand of the population based on registered data, and estimated totals including both adjustments for under-registration and, for years prior to 1933, estimates for non-registration states; and in the final column the excess of births over deaths, frequently termed the natural increase.

POPULATION BY STATES

Estimates of the civilian population have been made by states for July 1, 1945. These estimates are based partly on a projection forward of the 1943 estimates based on ration book registrations, and partly on current local data. The total civilian population of the United States on this date was smaller than in 1940 by 3.2 per cent, as indicated in Table 2, though the civilian population had increased by 873,123 in the year between July 1, 1944, and July 1, 1945.

The changes in the civilian population were by no means uniform as among the various regions of the United States. In the northeastern states the civilian population decreased between 1940 and 1945 by 6.3 per cent; in the north Central States by 4.8 per cent; and in the South by 3 per cent, while in the West the civilian population increased by 10.5 per cent, mainly as a result of the extensive development of war industries on the Pacific Coast. Among the

TABLE 4

CHANGES IN CIVILIAN POPULATION, BY STATES: 1940 TO 1945

---

* This figure represents the net civilian migration from outside the United States. If the migration figures for the several states could be confined to interstate migration alone, the sum of all the state figures would be zero, since in-migrants to one state would have to be out-migrants from other states.

individual states, California showed by far the largest increase, the gain amounting to 1,262,066, or 18.4 per cent, while New York with a loss of 1,119,191, or 8.3 per cent, showed the greatest loss. Estimates of the population on July 1, 1945, are presented by states in Table 4, with 1940 census figures for comparison, and with other figures representing the major factors in the change. In considering the figures in this table it should be kept in mind that, by 1945, the rate of induction into military service had been greatly reduced, as the number of persons in military service approached its maximum around the middle of that year.

On the basis of the 1945 estimates of civilian population, taken in connection with the records of military inductions and computations of natural increase for the several states, estimates of the net gain or loss through civilian migration have been computed. The process is to add the natural increase to the 1940 population, subtract miltary inductions, and compare the results with the estimated civilian population. If the estimated population is greater than the result of these computations, in-migration is assumed; and, conversely, if it is smaller, out-migration to the extent of the difference is estimated. These estimates of the net gain or loss through migration are presented in the last column of Table 4, while the two preceding columns show, respectively, the excess of births over deaths and the estimated net loss from the population of the state to the armed forces.

In general, the classification of the states on the basis of these estimated gains or losses through interstate migration is similar to the classification based on increase or decrease in civilian population. It may be noted, however, that some states, for example New Jersey and Ohio, which show a decrease in civilian population, nevertheless received considerable contributions in the form of in-migrant population from other states-contributions which simply made smaller their population decrease.

MARRIAGES

The most satisfactory current index of changes in the marriage rate is found in a series of monthly releases representing the number of marriage licenses issued in cities of 100,000 or more, which is published (usually within 30 days of the end of the month to which the figures relate) by the National Office of Vital Statistics of the United States Public Health Service. The cities represented in this series contain about one-third of the population of the country, and while increases and decreases in the number of marriages in the United States as a whole have not always followed exactly the same pattern as the figures for these cities, the trends are close enough to make the city data a fairly safe basis for forecasting the national data, which do not become available until some months later. The marriage license data for the cities are presented in Table 5 for 1945 and 1946, by months.

TABLE 5

MARRIAGE LICENSES ISSUED IN CITIES OF 100,000 OR MORE, BY MONTHS: 1946 AND 1945

Month	1946	1945	Increase, Per Cent
Total for year	—	569,289	—
11 months, Jan. to Nov.	716,469	511,984	39.9
December	—	57,305	—
November	60,110	55,691	7.9
October	61,070	52,026	17.4
September	64,113	45,689	40.3
August	74,640	50,108	49.0
July	59,211	49,348	20.0
June	86,448	55,325	56.3
May	73,959	45,005	64.3
April	63,643	39,817	59.8
March	51,144	41,256	24.0
February	59,673	35,635	67.5
January	62,458	42,084	48.4

The increase from an average of 47,441 per month in 1945 to an average of 65,133 for the first 11 months of 1946 is very striking, though it may be noted that a marked increase was taking place in the monthly marriage license figures well before the end of

1945. It is obvious that the principal reason for these increases was the return of service men to civilian life, and it may well be that the marriage rate will shortly revert to the level prevailing in 1944 or even to that prevailing prior to 1940, though there were no indications of the beginning of a recession in the data covering the year 1946.

The three years following 1939 each registered a decided increase in the number of marriages which took place in the United States, the total increase from 1939 to 1942 being 368,000, or 26.2 per cent. The rate per 1,000 of the population increased in the same period from 10.7 to 13.2, which remained the high point until 1946. At this writing (January, 1947) complete reports for the United States are not yet available, but it is estimated (unofficially) that the 1946 total will be well in excess of 2,000,000 and the rate above 15. Marriage data for the United States from 1937 to 1946 are presented in Table 6.

TABLE 6

MARRIAGES IN THE UNITED STATES: 1937 TO 1946

(Figures are estimates, except for the years 1937 to 1940)

Year	Number of Marriages	Rate per 1,000 of the Population
1946*	2,200,000	15.7
1945	1,618,000	11.6
1944	1,452,000	10.5
1943	1,577,000	11.6
1942	1,772,000	13.2
1941	1,696,000	12.7
1940	1,596,000	12.1
1939	1,404,000	10.7
1938	1,331,000	10.3
1937	1,451,000	11.3

* Preliminary unofficial estimate, based on percentage of increase in licenses issued in cities of 100,000 or more.

Incidentally, the number of divorces granted has increased in recent years even more rapidly than the number of marriages, namely, from 251,000 in 1939, or 17.9 per 100 marriages taking place in the same year, to 502,000 in 1945, or 31 per 100 marriages.

TABLE 7

ESTIMATES OF EMPLOYMENT STATUS OF THE CIVILIAN POPULATION OF THE UNITED STATES: 1940 TO 1946

Date	Civilian Population 14 Years Old and Over	Civilian Labor Force		Employed	Unemployed	
		Number	Per Cent of Population		Number	Per Cent of Labor Force

July, 1940	99,950,000	56,420,000	56.4	48,010,000	8,410,000	14.9

EMPLOYMENT

On the basis of reports obtained each month from a representative sample of about 25,000 households in various parts of the country, there have been published every month since March, 1940, estimates of the number of persons in the civilian labor force, the number employed, and the number unemployed. These figures are summarized for months or quarterly intervals from July, 1945, to December, 1946, and for July 1 of each year from 1940 to 1945, in Table 7. It may be noted that two different sets of figures are shown in this table for July, 1945, one for the end of the annual series, and another, somewhat larger, for the beginning of the quarterly and monthly series. The larger figures result from a new enumeration procedure adopted in July of 1945, which has the effect of making the term "labor force" somewhat more inclusive.

The result of the rapid demobilization of the armed forces following mid-year, 1945, appears in the increase of more than 10,000,000 in the civilian population between July, 1945 and July, 1946. The increase in the civilian labor force was not so large as this, partly because of withdrawal from the labor market on the part of large numbers of women who had been employed in the war industries, and a similar withdrawal on the part of some students and elderly men, coupled with the fact that many ex-service men did not get into the labor market immediately on discharge.

The decrease in the labor force from 60,110,000 in July, 1946 to 58,430,000 in December, represents largely the normal seasonal decline in agricultural employment. In fact, employment in non-agricultural industries was materially higher in December than in July, being 49,100,000 in December, as compared with 47,870,000 in July.

The number of unemployed increased from 950,000, or 1.7 per cent of the labor force, in July, 1945 to a maximum of 2,700,000, or 4.9 per cent, in March, 1946, showing a generally downward trend from that point on, with variations from month to month until it reached a low point of 1,930,000 in November, with a slight increase to 2,120,000, or 3.6 per cent, in December, 1946. This last figure, it may be noted, is far lower than the figure forecast in the summer of 1945 for this stage in the reconversion period.

The number of veterans returned in December, 1946, as seeking work was estimated at 840,000, while 1,710,000 veterans were still outside the labor force, including 1,110,000 in school.

SCHOOL ATTENDANCE

The percentages of young men and women attending school decreased sharply during the Second World War, according to estimates based on a survey conducted in October 1945, and involving specific inquiries of a representative sample of 25,000 households scattered throughout the United States. The decrease was most noticeable in the case of young men. It is estimated that in 1945 only 3.6 per cent of the male population 18 to 24 years old were attending school, whereas the 1940 figure was 15.1 per cent. The decrease was owing mainly to the induction into the armed forces of young men who would normally have continued in school, but a substantial part of it resulted from the fact that many of the young men who were not inducted left school early to take jobs. Even for the young men 18 to 24 years old who remained civilians, the percentage attending school in 1945 was only 10.6 per cent, or about one-third less than the percentage for all males in this age group in 1940. There was also a decrease in school attendance of boys 16 and 17 years old, from 68.2 per cent in 1940 to 58.6 per cent in 1945. The percentages of girls and young women 16 to 24 years old attending school also decreased, though not as sharply as the percentages for males.

By contrast, the percentages attending school for children under 16 years old increased appreciably between 1940 and 1945, continuing the long established trend toward a wider participation in educational activities

TABLE 8

SCHOOL ATTENDANCE OF PERSONS 5 TO 24 YEARS OF AGE: 1945 AND 1940

(Data for 1945 represent civilian noninstitutional population and are based on a small sample; data for 1940 are census figures representing total population)

Area and Age	October, 1945			April, 1940

* Percentages for 1945 based on estimates as computed, before rounding.

which was evident up to 1940 in the school attendance figures for older youths also. Since the end of the war the long-term trend of increasing school attendance for persons over 15 years of age has doubtless been resumed. Large numbers of veterans have taken advantage of the educational benefits offered them and returned to school, though it is possible that the formal education eventually obtained by the group between 16 and 24 years old in 1945 will be less than it would have been if the war had not occurred.

The school attendance figures for

October, 1945, are summarized in Table 8, with 1940 census figures for comparison. It may be noted, in connection with this table, that the 1945 survey was made at the beginning of the school term, when practically all children who had reached school age were enrolled in school, whereas the 1940 census was taken toward the end of the school term, when there were considerable numbers of children who had attained school age but who would not be enrolled until the next school year. Further, the school year had been completed in some areas before the date of the census enumeration, so that unduly low figures were returned for school attendance. In some cases, therefore, the actual increase in school attendance may not have been quite as great as the comparative figures would indicate.

Of the total number of persons five to 24 years of age attending school in October, 1945, 71.9 per cent were in elementary school, 25.3 per cent in secondary school, and 2.8 per cent in college or professional school. Practically all of those under 14 years of age were of course in elementary school (with a few, that is, 2.1 per cent, in high schools); and by far the major part of those 20 to 24 years old were in college or professional schools (with only 11.4 per cent in secondary schools); those 14 to 17 years old were mainly in high school; and those 18 and 19 were about evenly divided between high school and college, with a small residue still in elementary grades. In absolute numbers, there were 18,500,000 in elementary classes, 6,500,000 in high school, and 730,000 in college or professional schools. Since the standard elementary course runs through eight years and the secondary course only four years, one may get a better notion of the extent to which elementary school graduates continue into high school by computing a rough average per grade in these two types of school. Dividing the elementary total by eight gives 2,330,000 and dividing the high school total by

TABLE 9

four gives 1,630,000; and these two figures indicate a very satisfactory continuation through the 12 grades of pre-college education provided in our American system, there being, of course, a gradual dropping out from year to year through the elementary grades, and a somewhat more rapid dropping out through the secondary grades, as evidenced by the more detailed figures of the 1940 census.

FAMILIES

The number of families in the United States increased from 35,087,440 in 1940 to 37,900,000 in February 1946, the average population per family changing in the same period from 3.8 to 3.7. The number of families with a male head actually decreased during the war, from 29,734,200 in 1940 to 29,250,000 in May, 1945, but increased rapidly, with the demobilization of the military forces, to 31,300,000 in February, 1946. Conversely, the number of women acting as heads of families increased from 5,353,240 in 1940 to 8,210,000 in 1945, and then decreased to 6,600,000 in February, 1946, largely as a result of the return of husbands to their homes after discharge from the armed forces. These figures, with data also for May, 1944, are summarized in Table 10. All of the figures except those for 1940 are based on surveys of 25,000 or 30,000 representative families scattered throughout the United States, and are subject of course to possible sampling error.

One further very significant detail appears in the available tabulations, namely, the number of female heads of families who were classified as "Married, husband absent." This number increased from 785,180 in 1940 to 2,770,000 in 1944 (and presumably to a still larger number in 1945, though this classification is not available for that year), but had declined again in 1946 to 1,060,000. In another survey, classifying individuals rather than family heads, it was indicated that in 1944 nearly two-thirds of the married women with "husbands absent," that is, not living in the household at the time of the survey, were women whose husbands were in the armed forces; and even in 1946, military service afforded the explanation for more than one-half the absent husbands.

Between 1940 and 1945 there was a decline of about 800,000 in the number of rural-farm families, an increase of about 100,000 in the number of

TABLE 10

FAMILIES BY MARITAL STATUS AND SEX OF HEAD: 1946, 1945, 1944, AND 1940

(Data for 1946, 1945, and 1944 based on a small sample)

Sex and Marital Status of Head	Number of Families				Per Cent

TABLE 12

FAMILIES BY NUMBER OF CHILDREN OF SCHOOL AGE (6 TO 17 YEARS) IN URBAN AND RURAL AREAS OF THE UNITED STATES: FEBRUARY 1946

(Data based on a small sample)

Number of Children 6 to 17 Years Old	United States Total	Urban	Rural—Nonfarm	Rural—Farm
All families	37,900,000	24,010,000	7,630,000	6,260,000
No children 6 to 17	23,540,000	15,540,000	4,630,000	3,370,000
One child 6 to 17	7,470,000	4,840,000	1,480,000	1,150,000
Two children 6 to 17	4,000,000	2,330,000	860,000	810,000
Three or more 6 to 17	2,890,000	1,300,000	660,000	930,000
Per cent	100.0	100.0	100.0	100.0
No children 6 to 17	62.1	64.7	60.7	53.8
One child 6 to 17	19.7	20.2	19.4	18.4
Two children 6 to 17	10.6	9.7	11.3	12.9
Three or more 6 to 17	7.6	5.4	8.7	14.9

rural-nonfarm families, and an increase of about 3,000,000 in urban families, doubtless the result of the concentration of war production in urban centers. Between May, 1945, and February, 1946, the farm figure remained practically unchanged, the rural-nonfarm families increased by 250,000, and the urban families continued to increase, though at a much slower rate—only a little more than 100,000 in this period. Family data for rural and urban areas are presented in greater detail for 1940 and 1946 in Table 11.

In February 1946, there were 14,360,000 families with children of school age, that is, 6 to 17 years old, as compared with 13,771,000 in 1940. The 1946 total represented 37.9 per cent of all families, comprising 19.7 per cent with one child of school age, 10.6 per cent with two, and 7.6 per cent with three or more. In urban areas taken alone, 35.3 per cent of the families contained children of school age, as compared with 39.3 per cent in rural-nonfarm areas and 46.2 per cent in rural-farm areas. These figures give some indication of the number and proportion of families directly interested in school and related community activities.

Most of the children currently of school age were born during the 30's when birth rates were low. The number of families with children of school age in February 1946, therefore probably represents a level from which there will be a rising trend as the children born during the high birth rate years since 1940 reach school age.

RACE CONDITIONS IN THE UNITED STATES

By L. Howard Bennett
American Council on Race Relations

GENERAL

The degree of unity which a common peril made imperative during the war years began to disintegrate immediately following V-J Day and by 1946 there was positive evidence that the older, peacetime luxuries of prejudice, violence, and oppression were making a definite bid to reestablish themselves on the American scene.

The year was marked, on the one hand, with interracial violence: intimidation, beatings, lynchings, and riots, but, on the other hand, the very forces of intolerance and persecution set in motion a significant wave of protest and constructive democratic action. The boldness of the emerging hate groups, the blatant manner of their leaders, the dastardliness of their crimes generated a counter movement that sought to redress the imbalance in our national life. Numerous efforts were undertaken by an aroused citizenry and an embarrassed national government to suppress the rise of anti-democratic forces, outlaw hate groups, preserve citizenship rights, and improve racial conditions.

ANTI-SEMITISM

Anti-semitism, which to a marked degree went underground during the war years, became manifest in several sections of the country. Antisemitic literature increased throughout the country. Well organized campaigns were initiated in New York and Minneapolis to distribute and sell through the mails anti-semitic literature, including the famous anti-Jewish tract, the Protocols of Zion. Wherever postal authorities discovered these activities, they promptly suppressed them. Jewish welfare agencies reported that, with the ending of the war and the demise of the Fair Employment Practice Committee, an increasing number of Jews was being rejected for and discharged from employment. It was also observed that hotel and resort literature was filled with discriminatory specifications indicating the tenacity with which this practice persists in spite of laws in several cities and states prohibiting such advertisement.

There was violence and vandalism against Jews and their Synagogues. Altars in several eastern synagogues were desecrated, scrolls burned, flags torn, and synagogues set on fire. In two Brooklyn neighborhoods, as well as in Philadelphia and in Red Bank, Tenn., Jewish persons were set upon and attacked by hoodlums. A fiery cross bearing the letters KKK was burned on the Zeta Beta Tau Jewish Fraternity House of the University of Southern California and the letters KKK smeared in tar on the building. During the Jewish high holidays, Commissioner of Police Wallender of New York considered it a desirable precaution to assign 1,000 patrolmen to protect synagogues and worshippers in New York City.

In 1945, President Truman expressed the desire that 39,000 European refugees, many of them Jews, be admitted to the United States during 1946. He called on several Federal agencies to expedite the admission. Reports indicate that this program has not been effectively carried out. The Immigration and Naturalization Service reports that, during the first eight months of the year, only 3,452 displaced refugees reached these shores. Not all of these were Jews.

RESETTLEMENT OF JAPANESE AMERICANS

In 1942, there were approximately 127,000 persons of Japanese ancestry in the United States. The hysteria of war and the calculated plans of anti-Japanese American groups on the West Coast precipitated the mass evacuation of the Japanese to Relocation Centers for most of the war period. The resettlement program of the War Relocation Authority succeeded in dispersing approximately 110,000 persons of Japanese ancestry to all sections of the country. Nearly every state in the union received some resettlers, but the majority of the evacuees settled in the mid-western and eastern states. Before the war, 91 per cent of the total Japanese population of the United States lived on the West Coast, but only half of the approximately 110,000 evacuees have returned there. The Japanese have moved eastward to Minneapolis, St. Paul, Milwaukee, Chicago, Denver. The largest group, approximately 23,000, has settled in Chicago. Constellations of Japanese Americans are to be found also in New York, Washington, and St. Louis.

Church and civic organizations and governmental agencies have worked to insure democratic acceptance of the resettlers in the communities into which they have migrated. The commendable record of the 442nd Combat Team (Japanese Americans) and the participation of the Nisei in the whole war effort aided in effecting good public relations for this uprooted and dispossessed group. There was some intimidation of and violence against Japanese Americans in isolated communities on the West Coast, but for the most part the resettlement process has gone on without violence or an increase of hostility.

One of the problems confronting Japanese Americans, like all other elements of the population seeking reestablishment after the dislocations of the war, has been obtaining adequate housing and living space. In some instances, employment opportunities have been denied this segment of the population. This has been infrequent, for the unexpected heavy post-war demands for workers have tended to mitigate employment discrimination against the Japanese.

The National Opinion Research Center at the University of Denver, on the basis of a poll recently conducted, stated that hostile feelings against the Japanese living in the United States apparently are decreasing. The manner in which the resettlement program has proceeded corroborates this finding.

JAPANESE AMERICAN ESCHEAT CASES

Protest is mounting against the filing of escheat cases against Japanese American property owners by the State of California. These cases seek to have such property returned to the state on the basis that the Alien Land Act of the State of California makes it illegal for aliens to own and hold property. This legality is questioned in as much as the title to the property in litigation is held by persons of Japanese ancestry born in the United States and who consequently are citizens of the United States. The 1940 census estimated that 63 per cent of the persons of Japanese ancestry are citizens of this country.

Several suits have been filed by Japanese Americans in the Federal courts seeking to prove the unconstitutionality of the section of the Federal Nationality Act which limits naturalization to "white persons" only. They contend that this section of the act is in conflict with the 15th Amendment of the Constitution. Because of a recent amendment to the Nationality Act, Japanese Americans have pointed out they are nationals, not aliens.

INDEMNIFICATION FOR EVACUATED JAPANESE AMERICANS

On April 24, 1946, Secretary of the Interior Krug sent a letter to the President of the Senate setting forth the reasons why the Administration wanted legislation enacted providing for the indemnification of Japanese Americans evacuated from the West Coast by the Western Defense Command in 1942 on grounds of "military necessity." The bill (S2127) is being sponsored by Senator Ellender of Louisiana and in the House by Representative Eberharter of Pennsylvania. It would establish an Evacuation Claims Commission in the Department of the Interior. The Commission would have jurisdiction to settle claims made by persons of Japanese ancestry "for damage to or loss of real or personal property, or other impairment of assets that arose from or as a natural or reasonable consequence of the evacuation and exclusion program."

A bill has been introduced in Congress by Joseph Farrington, Republican delegate from Hawaii, removing racial restriction from Federal naturalization and immigration statutes. The bill (Housing Resolution HR857) is similar to the one introduced by Farrington in the last Congress. It would make it possible for those Japanese now classified as aliens to become citizens. It should be noted that the 79th Congress has added Filipinos and Indians to the list of persons eligible for citizenship. This suggests further inclusions in as much as it cracks the principle of excluding all Asiatic and Pacific islanders, other than Hawaiians, from eligibility to American citizenship.

MIGRATION AND HOUSING OF NEGROES

The Second World War occasioned and set in motion a significant internal migration of peoples. The demands for industrial workers attracted millions of people to new industrial centers. The migration of Negroes was exceedingly heavy. It was first a movement from southern rural communities to southern urban and industrial centers. From there it fanned out to northeastern, middle west, and far west industrial and war production centers. Studies conducted by welfare agencies more than a year ago indicated that Negro workers for the most part would remain in the congested production centers to which they had gone. The demobilization of the nation's armed forces has made another group with potentially high mobility. This is especially true among Negro veterans, and one year after V-J Day, large metropolitan centers of the northeast and middle west are still receiving large numbers of Negro immigrants, many of them with war service records.

The surge of war workers to the industrial centers in the north, south, and far west caused a mounting crisis in housing in these regions. This crisis had an inordinate effect on housing conditions among Negroes and other minority groups, and the already bad situation worsened and became acute. Cities like Chicago, Detroit, Cleveland, Buffalo, St. Louis, Los Angeles, and San Francisco were the hardest hit by the housing shortage. By 1940, all these cities, with the possible exception of Los Angeles and San Francisco, were already in the throes of a badly congested housing situation as it pertained to minority groups. It is estimated that, during 1940-1945, Chicago's Negro population increased 95,000 and Detroit's, 63,000. Cleveland witnessed an increase of 23,000, while Buffalo experienced an increase of 7,000 Negroes between 1940 and Aug. 1, 1943. In San Francisco, prior to 1940, there were only 4,000 Negroes according to the 1940 census. By 1944, the number of Negroes in San Francisco had increased to 23,000. These significant increases are indicative of the heavy stress and strain placed on housing facilities. Congested living, expanding neighborhoods, the competition for housing space have occasioned growing tensions and unrest.

Returning veterans and ever-coming in-migrants from the south continue to add to the housing pressures. The post-war program for housing construction has made no appreciable dent on the backlog of need for housing of Negroes. Heavy overcrowding in inadequate and already run-down facilities during the war years, without even necessary repairs and renovations, hastened the rapid deterioration of existing housing. This has meant that, as these units became "uninhabitable" by standards of decency, they were either closed to occupancy, reducing the number of units available, or the conditions under which the people were forced to live became increasingly worse. The latter has taken place.

A convincing array of evidence is available in Chicago to substantiate the observations of students in the field of intergroup relations that housing is a major factor contributing to race conflict. It is expressed in the violence attended to the moving of Negro families into borderline and new areas in which Negroes previously have not lived. In July, it was reported that, in the Chicago area alone during the more than two-year period between May 1, 1944 and July 20, 1946, there had been 46 arson-bombings and other acts of terrorism against homes occupied by Negroes. Thirty-five of these outbreaks occurred in the first seven months of 1946. Homes occupied by Negroes in these areas, which are considered by the dominant whites as being "off-side," were not only burned but bombed, buildings wrecked, stench bombs thrown through windows, buildings and particularly windows riddled with rifle shots, buildings stoned. This form of violence and terror has not confined itself to the northern urban centers; it has also occurred in the south.

NEGROES IN RECONVERSION AND EMPLOYMENT

More than 200,000 Negro workers were involved in the strikes of early 1946. It is significant to observe the contrast between the status and extent of participation of the Negro worker in the strikes following the Second World War and his status and participation in the strikes following the First World War when the Negro worker was used as a reservoir from which to secure "scabs" and strike breakers. In 1946, the Negro worker, particularly in the mass production industries, was an integral part of the labor movement and as such was liable to gain the benefits or suffer the losses of organized labor as a whole. The status of the Negro worker as a union member in 1946 was a stabilizing factor in racial relations, a positive factor in minority group employment opportunities and a deterrent to racial violence.

In the face of disproportionate lay-offs and cutbacks of Negroes in the early months of 1946, as reported by the President's Fair Employment Practice Committee, there stands out the effective role that unions can play in the area of fair employment practices. Local 450 of the United Electrical, Radio and Machine Workers at Sperry Gyroscope Co. voted unanimously that a clause be inserted in their contract with the company stipulating that the same ratio of Negro workers be maintained as was in existence Nov. 15, 1945. This was a singular instance in which a major union resorted to equity principles in order to offset the hardships that would afflict minority group workers by the inflexible operation of the traditional application of the rule of seniority. Another union, United Public Workers (CIO) in Washington, protested a provision in a proposal being drafted by the Civil Service Commission which the local union believed exposed its nearly 10,000 Negro members to prejudicial treatment.

The Fair Employment Practice Committee came to an end in 1946. Early in the 79th Congress when the bill to establish a permanent Fair Employment Practice Commission was introduced in the Senate, a small group of Southern Senators started a filibuster which culminated in the defeat of the legislation in February. In the very midst of the filibuster that was being conducted to kill the permanent legislation, the temporary wartime committee was receiving reports from its field offices indicating that the removal of wartime restraints was beginning to be reflected in disproportionate number of layoffs among Negro workers. The chairman of the President's Committee reported in January 1946 that Negroes accounted for 18 per cent of the decrease in the nation's employment, while they constitute about 9 per cent of the population.

The National Urban League, in a survey of 50 American cities, disclosed that Negro veterans were not sharing equitably in job opportunities or opportunities for job training. It stated that the United States Employment Service offers them only pre-war traditional jobs with few opportunities for on-the-job-apprenticeship training. The final report of the FEPC stated that the wartime gains of Negroes, Mexican Americans, and Jewish workers were being lost through an unchecked revival of discriminatory practices. No exceptions were made to the veterans of these minority groups. They faced the same difficulties that minority group workers as a whole encountered in obtaining training and finding work.

The extent of Negro and minority group workers' displacement and unemployment attained during the first months of 1946 did not continue throughout the year. The heavy employment occasioned by increased production and industrial activity reabsorbed minority group workers who for the most part were the first to be released with the cancelling of war contracts. While discrimination in employment continued, unemployment among Negroes did not mount to the extent anticipated by students of the problem.

An Executive Order and subsequent congressional legislation transferred the United States Employment Service from the states to the National Government during the early days of the defense and war period. President Truman, high government officials, and minority and labor groups were desirous of having the United States Employment Service remain under Federal control and jurisdiction during the entire reconversion period. The President's request for the retention of the employment service under Federal supervision was based on the sound proposition that under such auspices, the Employment Service would be in a better position to meet the strains, stresses, and dislocations of reconversion as both labor demand and labor supply shifted. Minority groups and their allies, however, had a more specific reason for wanting the service to remain federalized: they feared the revival of gross discrimination in employment under state supervision. Two USES offices came in for special citing because of segregation and discrimination. They were the offices in St. Louis, Missouri, and ironically, the Washington office in the nation's capitol. Four charges were levied against the Washington office: (1) applicants had to be interviewed by members of their own race, (2) there were racial designations on the card file of applicants, (3) separate offices existed for Negroes and whites, (4) separate lines had to be formed for persons seeking jobs or filing for unemployment compensation, the lines being formed on the basis of race. These charges were investigated by the Civil Service Commission and found to be substantially true. After a strong letter of protest about segregation in the Washington office was lodged by Secretary of Commerce, Henry E. Wallace, and by several organizations with Secretary of Labor Schwellenbach, he ordered an end to segregation in the Washington USES office.

NEGRO EDUCATION AND ACHIEVEMENT

There have been several significant developments in education during the year within the scope of race relations. Negro teachers in the South continue their efforts through suits in the courts and negotiations with school boards for the equalization of salaries. An area long neglected in the fight for equal educational opportunities—insistence on comparable physical facilities—has recently come in for direct attack. (See "Negro Education" p. 1041).

THE NEGRO IN POLITICS

On the basis of the decision handed down by the U. S. Supreme Court in the Texas primary case, the largest number of Negroes since Reconstruction enrolled for participation in the primary elections of the southern states. There were heavy Negro registrations in Georgia, Mississippi, and Arkansas. In each state, attempts were made to dissuade the Negro voters from participating in the election. The Negro vote was instrumental in electing Mrs. Helen Douglas Mankin to Congress from the Fifth Congressional District in Georgia and helped defeat Roy V. Harris, Speaker of the Georgia House of Representatives, who campaigned on a white-supremacy platform. The Georgia gubernatorial and the Mississippi senatorial campaigns were notable for the way in which the race issue was played up. In Mississippi, charges were filed against Senator Theodore Bilbo for encouraging intimidation and coercion, and in some instances physical violence, in order to keep Negroes away from the polls. A Senate Investigating Committee held hearings in Jackson, Miss., and Bilbo's right to a seat in the Senate has been contested. Eugene Talmadge, running on a platform that called for upholding white supremacy and restoring the white Democratic primary in defiance of a Supreme Court decision, was elected Governor of Georgia, but he died before taking office.

THE GILLEM REPORT AND NEGROES IN THE ARMED FORCES

Growing out of the confused opinions and controversies concerning utilization of Negro personnel in the Army, a Board of Generals was appointed in 1945 to study Army policy with reference to the use of Negro personnel. The Board functioned under the chairmanship of Lieut. Gen. Alvin Gillem, Jr. In March 1946, the Board issued its report, pointing out that the nation must not fail to use the assets developed through closer relationship of the races during the war years, stating: "While the lessons learned from the service of the Negro in the war just concluded are still fresh in our minds, and while the people as a whole are still military minded, it is the concerted opinion of this Board that a progressive policy for a greater utilization of the Negro manpower be formulated and implemented now, if the nation is to establish its military structure on the experiences of the past." (*The New York Times*, March 4, 1946).

The report called for a progressively flexible policy on the part of the War Department with the objective in view of continued improvement, physically and mentally, of all of the nation's citizens. Significantly, it stated that "at the earliest practicable moment any special consideration based on race" must be eliminated. Army policies should point toward an evaluation of the Negro on the basis of individual merit and ability. The report closes with the statement that "vacillation or weak implementation of strong policy will adversely affect the Army. The policy which is advocated is consistent with the democratic ideals upon which the nation and its representative Army is based."

There were several features of the report which fell short of the expectations of liberal and minority groups in the country. The report did not advocate the immediate dropping of segregation and discriminatory devices. It did call for some relaxing of the rigid segregation pattern in the composition of unit personnel. It is a step in the right direction, but not a long one.

The Army came in for severe criticism for failure to permit voluntary enlistment of Negroes when there was reached, according to the Army, a too large percentage of Negroes. Court action was brought to force the Army to admit enlistees without reference to race. In October, the Army announced that it would again accept Negro enlistees but only those who passed an examination indicating training equal to a high school education. This was a standard higher than that required of non-colored enlistees. Even though the Gillem report was not entirely satisfactory, there are indications that the Army intends to test its policy of gradual de-segregation at Army installations overseas and at home.

The Navy, once considered to be much less democratic than the Army and certainly offering fewer opportunities for its colored personnel, announced during the year the dropping of all restrictions limiting the areas. services, and grades which are open to Negroes and other personnel of color. This democratic policy was stated by Secretary of the Navy Forrestal in a letter to his special advisor, Lester B. Granger.

NEGRO PETITION TO UN

The National Negro Congress, which met in Detroit during the early summer, sent a petition under the provisions of Article 71 of the United Nations Organization charter to the Secretary General of the UN requesting the organization to probe racial discrimination. The Congress contended that Negroes had failed to receive relief from oppression through constitutional appeals and therefore found it necessary to bring this vital issue to the body's attention.

RACIAL VIOLENCE

The isolated interracial clashes that followed the cessation of hostilities with Japan were only the forerunners to more disturbing intergroup clashes in 1946. There were two race riots, many beatings, and numerous lynchings. Both of the riots occurred in the South. The first occurred in Columbia, Tenn. in February. The second occurred in August in Athens, Ala. when a mob of more than 2,000 whites ran roughshod through the city beating and mauling Negro men, women, and children indiscriminately. (For full accounts of the two riots see *Monthly Summary* issues Vol. 3, Number 8, March 1946, and Vol. 4, Numbers 1 and 2, August–September 1946).

In Freeport, Long Island, in February, the four Ferguson brothers, veterans of the war, were celebrating their first reunion in several years. They sought service in a tearoom operated by whites across from the Freeport Bus Terminal and became engaged in an argument with the proprietor when he refused to serve them. They left the tearoom but while returning to the Bus Station. Joseph Romeika, a police officer, accosted them and lined them up against the wall. The police officer killed two of the brothers, wounded one, and arrested the fourth, claiming that during a routine questioning of the men, one of the brothers "reached for his hip pocket."

The most shocking crime of the year was the lynching of four Negroes on July 25 near Monroe, Georgia, by a mob of unmasked white men. The victims of this multiple lynching were Mr. and Mrs. George Dorsey and Mr. and Mrs. Roger Malcolm. Mrs. Dorsey and Roger Malcolm were sister and brother. Only one of the victims was charged with any crime. The others were admittedly innocent. Roger Malcolm had been arrested for having injured Barney Hester, a white man on whose plantation he lived.

Conflicting stories circulate as to the reasons why Malcolm had attacked Hester. One version is that Hester was the innocent victim of his attempt to stop a fight between Roger Malcolm and his wife. The second is that Roger Malcolm resented the undue attention Hester had been paying his wife. At the time, a mob gathered and a lynching was averted only when a white woman who had known Malcolm for many years intervened in his behalf.

The lynching of these four Negroes, more than any single event during the year, aroused the nation. Governor Ellis Arnall of Georgia immediately dispatched the Georgia Bureau of Investigation to the scene and asked for Federal assistance. He offered rewards up to $10,000 for information that would lead to the arrest and the conviction of the perpetrators. Rewards were offered by groups and organizations all over the country totaling more than $70,000. In spite of the efforts of state, Federal and other investigators to secure information that would lead to the arrest, the grand jury, on Dec. 19, reported its inability to identify any guilty persons and therefore could make no indictment.

MINORITY GROUP VETERANS

The veterans constitute a special group in the nation. Minority group veterans constitute a special group among them. Negro, Mexican, and Japanese American veterans have suffered the same disabilities and disadvantages which have been more or less associated with the minority groups of which they are a part. The unfair and discriminatory treatment of minority group veterans has been a constant source of tension and a highly charged potential for serious intergroup violence. The Negro veteran particularly has faced the difficulties of job discrimination, discrimination in housing facilities, and failure on the part of USES to refer him to jobs commensurate with his Army-developed skills and training. For the most part, they have been referred to menial jobs. In addition, in many communities, rather than refer the minority veteran to gainful jobs, they have been certified for unemployment compensation. There have been few opportunities for Negro and other minority group veterans to participate in the apprenticeship-training programs. This, of course, eliminates them from training for skilled jobs.

To meet the growing difficulties confronted by veterans, the American Council on Race Relations called a National Emergency Conference on Minority Veterans Problems which was held in New York, April 6, 1946. Growing out of this meeting, a National Action Conference on Minority Veterans Problems was held in July in New York City. Representatives from the National Emergency Conference took specific recommendations directly to responsible authorities in the Veterans Administration, USES, Department of Labor, Retraining and Reemployment Agency, United States Office of Education and National Housing Agency.

The United Negro and Allied Veterans of America which was formed to secure the "full measure of rights" which Negro and other veterans are entitled to receive, was organized in April. The organization stresses the need for organizing 600,000 Negro veterans who reside in southern states.

THE KLAN AND COLUMBIANS, INC.

The incipient revival of the Ku Klux Klan and the bold emergence of a brazen competitor, the Columbians, Inc., took place in 1946. It is alleged that the Klan was instrumental in mobilizing the votes and intimidating and otherwise coercing Negroes in Mississippi and Georgia during the campaigns of Senator Theodore Bilbo and gubernatorial candidate Eugene Talmadge, respectively. The Klan held open air ceremonies at Stone Mountain near Atlanta, and has been known to be active in Tennessee, Alabama, California, South Carolina, Mississippi, Pennsylvania, and New York. In several states, law enforcement officials have been active in the effort to outlaw the Klan and suppress their activities. Governor Arnall directed Assistant Attorney General Dan Duke to take legal action for revocation of the charter of the Klan in Georgia. New York, California, Kentucky, New Jersey, and Pennsylvania have officially revoked the Klan's charters. President Truman has directed Attorney General Clark to use the resources of his office to maintain and preserve civil rights and outlaw subversive and anti-democratic organizations.

More brazen than the Klan has been the Columbians, Inc. This hate organization, with headquarters in Atlanta, advocates opposition to Negroes, Jews, Communists, and the rich "who oppress the masses." The organization was chartered in Atlanta in August 1945. It has attacked Negroes in Atlanta and has attempted to prevent them from moving into homes which they have purchased in previously designated white neighborhoods. It threatened those whites who opposed it with death, and defied police officers. Organizations throughout the country denounced Columbians for its avowed purposes of fomenting racial and religious strife. The Fulton County (Ga.) Grand Jury recommended that the charter of the Columbians be revoked. The state Attorney General instituted revocation proceedings. The organization's officers said they did not need a charter in order to operate.

Recognizing the shortcomings of existing Federal statutes to deal with subversive organizations, and in order to protect the civil rights of citizens of the United States, Attorney General Clark indicates that he will seek the strengthening of existing Federal legislation, and President Truman has appointed a Committee on Civil Rights to study the existing machinery to protect civil liberties and make recommendations for its improvement.

CHRISTIAN ORGANIZATIONS FOR DEMOCRACY

Church and Christian organizations took a decisive and courageous stand on the question of segregation and discrimination. The Federal Council of Churches of Christ in America representing the vast body of Protestant communicants in America, in its annual meeting in Columbus, O., renounced the pattern of segregation in race relations and pledged itself to work for a non-segregated church and a non-segregated society. Many Catholic groups, including the Social Action Department of the National Catholic Welfare Conference, meeting in Kansas City in November, adopted a resolution calling for equal services to Negroes with all other citizens. The Conference also went on record as favoring the participation of Negroes in all lay-organizations of the Catholic Church.

Both the YMCA and the YWCA in their annual meeting at Atlantic City approved and passed measures for their associations' activities that directly came to grips with the problems of race relations. The YWCA developed a program of 35 points that would include Negro members in "the main stream of Association life" that would lead to and effect the elimination of segregation. The YMCA endorsed a program of less strength and forthrightness, but along the same lines. The policies adopted at the Atlantic City meetings of the YMCA and YWCA have received implementation in several communities, notably Cleveland, Chicago, and New York. The Congregational and Presbyterian denominations made significant pronouncements concerning the practice of Christian brotherhood within the framework of the church. The Congregationalists stated: "We repent the sin of racial segregation as practiced both within and outside our churches, and respond to the mandate of the Christian gospel to promote with uncompromising word and purpose, the integration in our Christian churches and our democratic society of all persons of whatever race, color or ancestry, on the basis of equality and mutual respect in our exclusive fellowship." The Presbyterian Church, USA (northern) declared racial segregation an unchristian practice.

OFFICIAL TRENDS AND DEVELOPMENTS

Until recently government—national, state, and local—assumed no official responsibility for intergroup problems. In fact, they scarcely recognized that such problems existed. The relative success of the Fair Employment Practices Committee stimulated the agitation for permanent, legislatively created state agencies to deal with problems of discrimination. This public clamor resulted in the establishment of several State Commissions Against Discrimination. In 1945 the legislatures of New York, New Jersey, Wisconsin, and Indiana enacted non-discrimination statutes. In 1946 Massachusetts followed suit and enacted a law creating the Massachusetts Fair Employment Practice Commission. At one time, 22 states had bills before them for the establishment of FEPC laws. At the present time, groups in 12 states are pressing for legislative enactment of fair employment practice statutes.

There has been the extension of this movement from the Federal level to the state, and from the state level to the local, municipal government level. Since the rash of race riots during the spring and summer of 1943, more than 38 official race relations committees have been formed. Among them there has been a high mortality. Fifty per cent of them have either become inactive or have gone out of existence. A recent study completed at the American Council on Race Relations shows that today there are 14 major and five minor official committees in operation and functioning today.

Three of the official committees in race relations have been created as a result of legislative action on the part of the city government. Ordinances have been passed, making them an organic part of the city government. These official agencies are the Cleveland Community Relations Board, Toledo Community Relations Board, and City of Buffalo Board of Community Relations. The other committees get their official status either through the executive power inherent in the office of the mayor who appointed them or by receiving appropriations from the city on the action of the City Council, or by both.

This distinction between official agencies on the state level and local level should be noted: the state agencies are directed to deal specifically with the problem of discrimination in employment, with projection into the fields of health, education, housing, recreation, *etc.*, being ancillary; while, where there is stated substantive jurisdiction, the local agencies deal with the entire gamut of intergroup and human relations, with the disposition of the agency personnel and board composition being the main factors that determine priority in consideration of problem areas.

The emergency of these official agencies represent a desirable and new assumption of responsibility by government for playing a positive role in interracial and human relations.

UNOFFICIAL VOLUNTARY ORGANIZATIONS

Unofficial, voluntary agencies in the field of race relations are much more numerous than the official. They are national, regional, state, and local in scope and area of operation. The *Directory of Agencies in Race Relations, National, State and Local* (Julius Rosenwald Fund, 1945) and supplementary data in the files of the American Council on Race Relations show that there are approximately 225 local community, 27 state, and 123 national organizations operating in the field of intergroup and related problems. Seventy-five of these national organizations deal specifically with race and intergroup problems. Most of these voluntary agencies have come into being since 1943 and represent "one of the most notable trends of the war years."

NEW TECHNIQUES

New adaptations have been made of the social survey in assisting communities to deal effectively with their problems in race and intergroup relations. Two of these adaptations come in for mention and during 1946 were receiving increased use as social tools. They are the Race Relations Clinic and the Community Self-Survey Analysis. Both of these devices, though with important differences as to length of time and technical direction, seek to have the community discover for themselves their own areas of social maladjustment and group tensions as a prelude to remedial social action. Race Relations Clinics have been developed under the auspices of the Race Relations Department of the Federal Council of Churches of Christ in America and have been conducted in more than 22 cities. The Community Self-Survey Analysis has been employed in the work of the Race Relations Division of the Institute of Social Sciences at Fisk University and has been carried out in four cities.

One of the areas of potential interracial strife is in the three-way relations between the police, minority groups, and the public. In recent months, several police departments in widely separated sections of the country have instituted training courses for the police in minority group relations. This program in police training has been directed by the American Council on Race Relations. Training programs have been conducted by the Council for departments in Richmond, Calif., Minneapolis, Youngstown and Dayton, O., and for the Rangers of the Cook County Forest Preserve. The Race Relations Division of the Julius Rosenwald Fund conducted a course in race relations for the police officers of the Chicago Park District.

JUDICIAL DECISIONS AFFECTING RACE CONDITIONS

There were at least ten important decisions by the Supreme Court of the United States and inferior Federal courts affecting the course of race relations. Three of them merit special citation. The most far-reaching was the decision handed down by the Supreme Court in the case of *Morgan vs. Commonwealth of Virginia.* A six to one decision by the court declared a Virginia statute requiring segregation in bus travel an undue burden on interstate commerce and contrary to the Constitution. This decision, while skirting the direct issue of racial equality, nevertheless outlawed Jim-Crow travel accommodations. The Morgan decision was based on a suit involving interstate travel on buses. A second court case extended the application of the decision to railroad coaches when the District Court of Appeals in the District of Columbia held that the Morgan decision was binding on railroad coaches in interstate commerce.

The third case was the decision of the Fifth Circuit Court of Appeals in upholding the decision of the Middle Georgia District Court that Negroes were entitled to vote in primary elections. These judicial determinations were in support of and extended the coverage of the Texas Primary Case which declared Negroes could not be barred from voting in the primary elections of that state.

AMERICAN INDIAN AFFAIRS

By D'ARCY MCNICKLE

OFFICE OF INDIAN AFFAIRS, DEPARTMENT OF THE INTERIOR

ADMINISTRATION REFORM

The task of modernizing the Office of Indian Affairs became the first concern of the new Commissioner, William A. Brophy, who succeeded John Collier in March of 1945. The Office, which has existed as a Federal agency since June 30, 1834, is charged with the administration of numerous statutes reflecting the will of Congress. These statutes are literally numbered in the thousands, many of which are no longer appropriate. In carrying out the statutory requirements, regulations numbering also in the thousands have been issued from time to time. Out of this mass of law and regulatory device, procedures and policies often emerge which seemingly have no rational justification; and equally often procedures or policies which would be desirable and efficient are precluded by underlying law.

Typical of the inefficiency resulting from the accumulation of years of such practices was the budget under which Indian affairs have been administered in recent years. This budget had come to be a collection of numerous appropriation items, each item having been well justified in its initial authorization. As years went by the item remained, and money was appropriated for the function it represented without regard to whether the function was longer needed or was needed in greater or lesser degree. Meantime other activities which should have been assumed could not be justified in the budget. This difficulty has now been corrected by reducing, with the consent of Congress, the number of appropriation items from approximately 100 to 28. The remaining items represent larger classifications with greater elasticity within each category.

Perhaps an even more important reform was the enactment by Congress, Aug. 8, 1946, of Public Law 687, authorizing the Secretary of the Interior to delegate to the Commissioner of Indian Affairs and the Commissioner in turn to delegate to field officials, authorities vested in the Secretary or the Commissioner by law. This had always been a stumbling block in any effort to decentralize the functions of the Indian Service. The statutes uniformly directed the Secretary or the Commissioner to perform certain duties, without leaving any discretion in these officers for delegating authority to employees stationed on the Indian Reservations in direct contact with the Indian people. This meant that few decisions were made locally, and enormous loads of paper work accumulated at central headquarters.

Immediately upon the passage of Public Law 687, five district offices were created, at Minneapolis, Billings, Mont., Portland, Ore., Phoenix, N. M., and Oklahoma City. To the officer in charge of each district office and also to the superintendents of the Indian reservations, authority was delegated for certain types of local decision.

THE RETURNING VETERAN

Indian veterans and war workers, numbering, respectively, 25,000 and 40,000, faced serious problems of adjustment. Indian incomes had been among the lowest in the nation before the war. Roughly 100,000 Indians had no land at all or had only small parcels of no economic value. Yet Indians have continued to be predominantly a rural people, dependent on land for subsistence. Although in the war year 1944 the income of individual Indians was about 2½ times that of 1938, it appeared nevertheless that one-third of the Indian families earned less than $500; two-thirds of all Indian families had less than $1,000. The same shortage of land and the same meagerness of economic opportunity exists, and as wartime wages and servicemen's allotments disappear, the Indians will presently return to their pre-war situation. The problem is most acute on the Navajo Reservation, where 55,000 Indians, the largest tribe in the United States, are living in an area which at present can not support more than half that number. There, the condition is particularly aggravated by the fact that the tribe is increasing at the rate of better than two per cent a year. With each year that passes, approximately 1,000 additional persons must be fed when there is not subsistence enough to feed those already there.

ECONOMIC ACTIVITIES

The principal source of income is agriculture, and cattle raising is the largest single activity. During the past year, sales from all agricultural products was in the neighborhood of $23,000,000, exclusive of $9,000,000 worth of products consumed at home. Of this total farm income, sales of livestock products amounted to $16,-

376,000. This farming economy is financed through a revolving credit fund authorized in 1934 and administered by the Office of Indian Affairs. At the present time loans totaling more than $10,000,000, including $3,529,898 made from tribal funds, are in force. Repayments totaling $3,279,640 have been made and reloaned to other clients. Out of this total, only $14,459 is currently past due, while only $2,746 has been written off as uncollectible.

EDUCATION AND HEALTH

The schools and hospitals operated by the Indian Office suffered during the war years for lack of personnel and through deterioration of plant and equipment. School attendance, which had fallen off heavily, has regained losses as rapidly as teaching staff and repairs of facilities would permit. Attendance at day schools during the year 1941-42 had been 25,839. This total has not yet been reached but presumably it will be reached and passed in the current year. In addition to day schools, Indian children are enrolled in boarding schools operating on the reservations and in boarding schools away from the reservations. The Indian Service operates 76 hospitals and sanatoriums with a total bed capacity of 4,080, which includes 1,244 beds for tuberculosis patients. Admissions numbered 39,582 patients, and, in addition, 921,123 out-patient treatments were given. The shortage of nurses was relieved somewhat by using Senior Cadets of the United States Cadet Nurses' Corps in some hospitals. The shortage of physicians continued to be a serious problem.

LEGISLATION

The most important single piece of legislation enacted in the field of Indian affairs in many years was the creation by Congress of an Indian Claims Commission. Indians had urged the creation of such a body for many years as a means of getting a fair and prompt hearing on claims growing out of broken treaty promises and inequitable treatment at the hands of the Government. Congress, in 1863, had declared by law that no Indian tribe could sue the United States as a result of breach of treaty without the consent of Congress. As a result of this action, Indian tribes having grievances were required to go first to Congress for a jurisdictional act, adoption of which was frequently delayed for terms as long as ten years. If the jurisdictional act was not broadly phrased, the Court of Claims frequently found that it could not entertain the type of claim presented by the tribe, and additional delays resulted.

The Indian Claims Commission Act of Aug. 13, 1946 requires all tribes to file their claims within a period of five years, and within a period of ten years from its creation the Commission must report a finding to Congress.

The outstanding Court decision affecting Indian affairs was that of the United States Supreme Court in the case of the Alcea Band of Tillamooks, *et al.* In this determination the Court held that original Indian title, even though not confirmed by formal treaty, is good against the United States as well as against third parties. While the Court was divided on the question of whether Congress had the constitutional power to confiscate Indian lands, it was unanimous in maintaining that, in the absence of Congressional action, administrative officials have no power to dispose of Indian possessions.

DIVISION XV

SOCIAL PROBLEMS AND CONDITIONS

PUBLIC SOCIAL WORK AND WELFARE

By Howard L. Russell
American Public Welfare Association

GENERAL

The first full post-war year of 1946 saw public welfare agencies coping with social problems resulting from industrial reconversion, the return of millions of veterans, widespread strikes, and inflationary trends in living costs.

Nationwide social insurance programs were subjected to the first major test in their ten-year history. They served as an effective cushion in national reconversion from a wartime economy as did the national program of veterans' benefits in assisting the readjustment of discharged servicemen to civilian life.

During the year, welfare administrators found assistance rolls rising because many persons of marginal employability were pushed out of the labor pool by the increasing availability of employable veterans. This increase in persons needing public aid was less dramatic than expected. largely owing to the cushioning effect of wartime savings plus benefits available through the social insurance and veterans' programs.

The most difficult task of public welfare administrators was to keep assistance grants abreast of constantly rising living costs. Handicapped persons dependent on public aid for the basic necessities of life are affected the most by inflationary trends and particularly hard hit by rising food costs, since food represents a higher proportion of the total budget of assistance families than of any other population group.

At the end of 1946, public welfare agencies were generally facing financial deficits and seeking supplementary appropriations. Additional Federal funds for the aged, the blind, and dependent children, made available in October by the 79th Congress, provided substantial help to state and local welfare programs in meeting the obvious need for greater adequacy in public aid grants.

Equally significant during this year was the increased demand on public welfare agencies for help other than financial aid in treating social problems related to lack of housing or crowded quarters, dependent and neglected children, lack of medical care, and family maladjustments. The need to provide social services served to emphasize the long continued shortage of trained and qualified social workers in the public welfare field.

FEDERAL LEGISLATION

Each year of the war saw an increasing number of proposals for Federal welfare legislation, but because of the absorption of Congressional committees with the conduct of the war, few of these proposals were enacted into law. In 1946, however, Congressional committees turned to serious consideration of such proposals and a few important welfare laws were passed.

The House Appropriations Committee produced the Calhoun Report providing substantial background data on social security and public assistance. Lack of time prevented comprehensive treatment of proposals in this field, but Public Law 719 was enacted which increased Federal financial participation in public assistance for the aged, blind, and dependent children; provided unemployment compensation for maritime workers; gave retroactive coverage to veterans under the old age and survivors insurance program; and doubled previous appropriations to the Children's Bureau for its maternal and child health, crippled children, and child welfare programs.

The 79th Congress also enacted two important health measures. The Hospital Construction Act authorized $3.000,000 annually for planning and $75,000,000 annually for construction of needed hospital facilities in the form of grants-in-aid to the states. Another law authorized the establishment of a National Institute of Mental Health.

The appropriation bill for the Federal Security Agency contained provisions for continuing the Civilian War Assistance program for another year for the purpose of providing temporary aid and transportation for American citizens and their children returned from areas of military operation to this country and for the return to the Philippine Islands of civilians evacuated during the war years.

Other action taken by this Congress of interest to public welfare included that of returning the public employment offices to state jurisdiction. liberalizing the provisions of the Railroad Retirement Act, extending terminal pay in U. S. bonds to enlisted men, extending aid through the Federal Works Agency for the construction of facilities to educational institutions serving veterans, extending and modifying the Price Control Act, and providing for the reorganization of Congress.

INTEGRATION OF FEDERAL WELFARE FUNCTIONS

One of the most important governmental accomplishments in relation to public welfare came about through executive order. The President's Reorganization Plan No. 2, among other acts, abolished the Social Security Board, transferring its functions to the Federal Security Administrator and transferred the Children's Bureau from the Department of Labor to the Social Security Administration. This integration of Federal welfare functions hold promise of increased effectiveness in many of the public welfare services.

STATE LEGISLATION

New York.—Comparatively few state legislatures were convened during 1946 but those which did meet enacted important public welfare laws including many laws affecting the status and rights of veterans. New York enacted into law the major recommendations of its Special Committee on Social Welfare which for two years had been studying the "patchwork" quality of welfare functions accumulated through years of piecemeal legislation. The legislature sought three major objectives. First, the integration of services to the needy, including provision for a single office in which the needy might apply for all types of public assistance and care, investigation of family needs by a single agency, and uniform standards of assistance and care within any individual county. Second, the substitution of a residence requirement for the current cumbersome and costly settlement system. Third, the stabilization of state aid to local districts for support of welfare expenses and administration. Localities were required to choose one of four major options in reorganizing their welfare services and to receive the financial benefits provided in the law.

New York's legislature also authorized a comprehensive, two-part, public health program. One part dealt with a master plan for a statewide attack on tuberculosis and the other part strengthened local health activities. Other New York laws provided important changes and improvements in the state's child welfare and mental hygiene programs.

California.—The State Department of Mental Hygiene received, in 1946, the largest appropriation in its history for construction of new facilities. California also enacted sickness and disability legislation to benefit unemployed persons and followed New York in authorizing the continuance of day care centers for working mothers from which Federal support had been withdrawn.

Mississippi allocated most of the state's surplus funds to new welfare institutions and improvement of existing ones and its legislature materially strengthened both its public assistance and child welfare programs.

Georgia.—The legislature in a short 15-day session passed far-reaching social legislation that expanded its child welfare, public assistance, and recreation programs, and made new advances in public health. It passed a new child labor law which raises the minimum age for employment of children in certain industries from 14 to 16 years.

New Jersey in 1946 enacted over 60 laws on behalf of veterans and for strengthening programs concerned with education, employment, loans and civil service status. The legislature also gave the Juvenile and Domestic Relations Court exclusive jurisdiction over minors under the age of 18 and improved the administration of welfare services by consolidating the office of Overseer of the Poor with that of the Municipal Director of Welfare.

Ohio enacted laws that provided increased benefits for needy aged and blind persons and authorized increases also in grants under the Aid to Dependent Children program. At the August special session, the General Assembly provided that inmates of County Homes over 65 years of age could be eligible for public assistance at state expense. Illinois passed a similar law in 1945 and the experience under these laws is being watched by many states who desire to provide more and better institutional care for their aged population.

Virginia strengthened its adoption laws in 1946 and provided new financial support for its Juvenile and Domestic Relations Courts. Virginia also authorized its Department of Public Welfare to develop a statewide system of public homes for the care of the chronically ill, infirm, and incapacitated in need of institutionalization. (See "State Administration and Legislation," p. 178.)

LOCAL PUBLIC WELFARE

Local public welfare agencies, during 1946, felt the impact of increasing applications for aid for the first time since pre-war years, and available funds were strained by the need to increase individual grants to offset rising living costs. With inflexible tax sources, local governments faced with rising welfare costs generally turn to state and Federal governments for financial aid. The year 1946 was no exception in this regard for there was a definite trend in welfare financing to look toward the larger governmental units to assume the increased costs of public aid. This trend in financing is not accompanied, however, by any desire further to centralize welfare administration at the state or Federal level.

The year being marked with large-scale labor strikes, the question of eligibility of strikers for public aid concerned many local welfare agencies. The City of Detroit, anticipating the problem, worked out its policies and procedures with the help of a citizens' advisory committee and successfully applied them during 1946. Few local agencies found it necessary, however, to assist the families of strikers in very large numbers.

PUBLIC ASSISTANCE

The downward trend of public assistance caseloads which prevailed throughout the war years was reversed during 1946, and all types of public aid showed increases both in the number of persons aided and in public funds expended.

The entry of the United States into the Second World War saw few employable persons receiving public aid, but the increasing demands for manpower from war plants drew many aged persons, mothers of small children, and other persons of marginal employability into the labor market from the assistance rolls. Late in 1945, with the reconversion of wartime industry to a peacetime basis, the persons of marginal employability were displaced, and many found themselves again in need of assistance.

In September 1946, 282,000 general assistance cases were being aided throughout the country. This represented an increase of 21.6 per cent over the previous year, while the month's expenditure of $9,796,000 represented an increase of 42.2 per cent in the same period. For this type of assistance, the expenditures represent state and local funds only as in contrast to assistance to the aged, the blind, and dependent children, the cost of which is shared by the Federal Government.

Old age assistance, aiding 2,134,585 persons in September 1946, rose 4.9 per cent over the number aided a year previous. Expenditures for old age assistance were $68,635,000 an increase of 11.8 per cent over the corresponding September of 1945.

The 75,274 blind persons receiving aid in September 1946 in the amount of $2,605,000 represented an increase of 6.5 per cent in the number of persons and 13.1 per cent in expenditures over the previous year.

In September 1946, public aid on behalf of dependent children was given to 323,360 families, including 829,309 children at a cost of $17,918,209. This represented an increase of 26.1 per cent in the number of children and 41.6 per cent in the expenditures over a year previous.

It is to be noted that the 1946 per cent increase in expenditures for all types of public aid doubled the per cent increase of the caseload. This reflects the efforts made to keep assistance grants abreast of rising living costs.

SOCIAL INSURANCE PROGRAMS

The operations of the federally administered program of old age and survivors insurance and the state-administered programs of unemployment compensation are importantly related to public welfare in their assumption of an increasing role in meeting economic need.

At the end of September 1946, almost 1,600,000 monthly benefits were in current-payment status at a monthly rate of $29,800,000 through the old age and survivors insurance program. This represents a substantial increase over the 1,180,000 benefits at the monthly rate of $21,650,000 in effect during September 1945.

Since unemployment compensation began paying benefits in 1936, more than $3,500,000 have been paid out to persons temporarily unemployed, and in September 1946, the reserves accumulated for this program amounted to $6,790,000,000. In this month $63,200,000 was paid out to an average weekly number of 839,000 beneficiaries.

The availability of social insurance benefits has an appreciable effect on reducing the demands for public aid which would otherwise have been made on the public welfare agencies.

CHILD WELFARE

Congress, during 1946, gave a decided impetus to the provision of nationwide child welfare services by doubling previous Federal appropriations for the Children's Bureau's programs for maternal and child health, crippled children, and child welfare. These Federal funds are made available to state and local agencies to supplement their own programs and to make services to children more widely available.

Services on behalf of children that are considered essential in every community include the protection of children in their own homes; the arrangement of care for children outside their own homes where necessary; the finding of and securing attention for children who are physically or mentally handicapped; safeguarding children of illegitimate birth; service to courts handling problems of child custody or juvenile delinquency; assistance to child-caring institutions in problems of admission and after-care services; extending psychiatric or other casework services to children in connection with mental hygiene clinics; assisting schools in handling attendance and conduct problems; and organizing community activities for the prevention of juvenile delinquency.

The problem of providing such community services is not financial alone. Approximately five out of six counties in the nation do not now have the services of a full-time child welfare worker. Since the shortage of professional workers in this field continues to be a major problem, public funds will be used in many agencies for the training of personnel.

The emergency Maternity and Infant Care program under which, during the war, servicemen's wives and babies received free medical, hospital and nursing care has been continued by Congress for another year.

In doubling the usual appropriations for child welfare services, Congress acted on testimony relating to the need of state and community services. Some 4,000,000 children in the country have lost one or both parents; at least 60,000 of these are children of men who died in the last war. Nearly 1,000,000 children come to the attention of the police each year; 250,000 of them are in serious enough trouble to reach the juvenile courts. Eighty thousand children are born each year to unmarried mothers, at least half of whom are little more than children themselves, under 20 years of age. A quarter of a million dependent and neglected children are in institutions; many thousands are in need of foster home care. Many children lack supervision and guidance because their mothers are employed or are ill or for other reasons. In 1944, 2,770,000 mothers of children under 14 years were employed, most of them because of economic necessity. Specialized services to meet social problems involving children, though widely recognized as necessary, are not yet generally available throughout the country.

INSTITUTIONAL CARE FOR THE AGED

During 1946, public welfare administrators sought more and better facilities for aged people who can not take care of themselves. Hospitals, convalescent homes, infirmaries for the chronically ill, nursing homes, and homes for the aged are generally crowded, substandard, and in some communities lacking entirely.

Long-term trends, indicating continued population movement toward urban centers, housing shortages, and an increasing percentage of the population in the aged group account for the increasing number of persons in need of some degree of custodial, medical, or hospital care.

The passage of the Federal Hospital Construction Act in 1946 will provide stimulation through financial support of state and local hospital facilities. Several states, including Illinois and Ohio, have passed enabling legislation, promoting the conversion of suitable poor farm facilities into modern infirmaries. Many states are currently reviewing their licensing laws as a medium for raising standards in convalescent and nursing homes. In spite of a prohibition in the Federal Security Act preventing the granting of public assistance to inmates of public institutions, some states are authorizing state and Federal funds for this purpose.

Local governments in most states bear almost the whole public cost of hospital care for the chronically ill, custodial care for the disabled and handicapped, domiciliary care for those who choose to live in institutions, and institutional care for dependent and neglected children. In the greater part of the country, the county is the local unit which provides this institutional care. These governments are the least able financially to bear the cost of the needed improvements and extension of institutional care. In the past year there was a trend in the direction of having state and Federal governments assume a greater share of the total cost of institutional care.

CONCLUSION

The year 1946 witnessed a reversal of the wartime downward trend in public dependency. Requests to legislative bodies for larger appropriations to meet rising costs of public welfare will undoubtedly tend to focus attention more sharply on the organization and administration of public welfare in order to seek greater value for the welfare dollar. The responsibility which government has assumed for handicapped indigent citizens will continue to require large expenditures of public funds provided by local, state, and Federal governments.

HOUSING

By Howard F. Vickery
Director of Information, National Housing Agency

VETERANS EMERGENCY HOUSING PROGRAM

Housing activities during 1946 were centered on providing shelter for returning war veterans. Home building was carried on under the Veterans Emergency Housing Program, with the Housing Expediter in charge, utilizing the facilities and staff of the National Housing Agency.

The National Housing Agency was created by executive order of the President on Feb. 24, 1942, to centralize non-farm housing responsibilities formerly assigned to more than a dozen agencies. Policy decisions are made in the office of the Administrator and operations are carried out through three major constituent units: Federal Home Loan Bank Administration, Federal Housing Administration, and Federal Public Housing Authority.

To launch a full-scale attack upon the veterans' housing emergency, the Office of the Housing Expediter was created by Executive Order 9686 on Jan. 26, 1946. Under the Housing Expediter, who was also appointed Administrator of the National Housing Agency 11 days later, the Veterans Emergency Housing Program was launched on Feb. 8. By Dec. 1, 1946, the home construction record of the Veterans Emergency Housing Program for the first 11 months of 1946 showed as follows:

Total Units Begun in Eleven Months		950,200
New Permanents	633,600	
Conversions	55,200	
Trailers	41,900	
Temporaries	193,500	
Other Public Bodies and Schools	26,000	
Total Units Completed in Eleven Months		584,300
New Permanents	395,800	
Conversions	54,700	
Trailers	41,900	
Temporaries	83,300	
Other Public Bodies and Schools	8,600	

It was apparent that the total number of housing units of all types put under construction during the full year of 1946 would reach the 1,000,000 mark, with all the original volume goal of the program substantially achieved or exceeded, except that for factory-built houses.

NHA was well-equipped, in organization and experience, to carry out the Veterans Emergency Housing Program. It had administered, from 1940-45, a war housing program in which more than 2,000,000 dwelling units were put under construction, all but about five per cent being completed by V-J Day. More than 700,000 additional units were built outside the program, most of them before 1942, when government housing regulations went into effect. Private investment supplied more than 1,000,000 units of war housing with a private investment of nearly $5,000,000,000.

This was enough to keep a core of the building industry active to meet imperative needs and in stand-by condition for the post-war job to come.

LIFTING OF CONTROL

On Oct. 15, 1945—two months after the war ended—WPB Order L-41, the war measure which restricted non-residential construction and limited residential building to quotas established by the National Housing Agency, was lifted, and sales price ceilings and priorities for materials were abolished. The result was a boom in non-residential construction, chiefly at the expense of home building. War-curtailed building materials producers and distributors were not yet ready to meet the tremendous demand. Many home builders found themselves unable to compete for scarce materials against commercial and industrial builders. Residential construction declined accordingly.

HOUSING EMERGENCY

Meanwhile, the nation's long-standing housing shortage became a housing emergency. As of Oct. 1, 1945, 1,200,000 families were living doubled up with other families. More men were leaving the armed forces in one month than the largest number of houses America had ever built in one year. Vacancy rates in most cities and towns had dropped to all time lows. It was estimated that something near 3,000,000 new dwelling units would be needed by the end of 1947 just to keep the shortage from getting worse.

On Dec. 31, 1945, Title V of the Lanham Act was amended to provide $191,900,000 to aid in providing re-use war housing to communities and educational institutions for veterans' accommodations. An additional sum of $253,727,000 was appropriated under the same act on April 9.

PRIORITY RATINGS

With the plight of homebuilders steadily growing worse, the Government began to restore controls over housing at the turn of the new year. The Civilian Production Administration issued Priority Regulation 33 on Jan. 15, 1946; this established a priority system ("HH priorities") covering 11 critical materials applicable to the construction of veterans' housing costing $10,000 or less or renting for $80 or less a month per unit. Subsequent amendments raised the number of building materials under HH priority ratings to include almost every type of scarce material.

PROGRAM OF HOUSING EXPEDITER

To coordinate these individual approaches to the housing emergency, and to overcome the veterans' emergency housing problem, the Office of the Housing Expediter was established. The Housing Expediter was authorized to formulate plans and programs to provide for an increased supply of housing for veterans of the Second World War, coordinate the activities of other executive agencies to carry out such plans and programs, recommend needed legislation to the President, and consult and cooperate with other national and local agencies, organizations, and industries to solve the housing emergency. On Feb. 7, 1946 the Housing Expediter submitted the Veterans Emergency Housing Program to the President, who approved it the following day.

The program set up a target—2,700,000 moderately-priced homes and apartments for veterans under construction by the end of 1947. It mapped out a campaign—stimulation of building materials production; limitation on the prices and rents to be charged for new houses; sales and rental preference for veterans, servicemen, and non-veteran hardship cases; cutting down of deferrable non-residential construction; priorities and allocations of scarce materials and equipment to home builders; channeling the bulk of building materials to moderately priced housing; construction of some 200,000 temporary housing units with funds authorized by Congress; recruitment of 1,500,000 additional workers; organizing community action programs.

The Veterans Emergency Housing Program as thus conceived, was by far the most ambitious home-building program ever undertaken. It called for building, in 1946 alone, three and one-half times as many homes as were built in 1945; building 70 per cent more in 1947 than in 1946; increasing production at a rate in 1946 that took five years to achieve from 1920 to 1925, the year of peak housing production.

The first order issued under the new program was Veterans Emergency Housing Program Order 1, on March 26, 1946. It called for deferment of new, unessential, non-residential construction to ease the strain on the many critically short building materials and thus make more of them available for veterans' housing, restricted all new housing to that covered by priorities at $10,000 or less, and required authorization to start any major construction work.

To aid construction of both rental units and moderately priced housing. a channeling order was issued on April 21, requiring 25 per cent of all HH authorizations reserved for rental housing, and 50 per cent of both rental and sales construction to be priced at or below local dividing lines. These dividing lines are based on the local current cost of producing a minimum acceptable two-bedroom house, as determined by FHA standards.

LUMBER SUPPLY PROBLEM

To break one of the building industry's chief bottlenecks—lumber—the National Housing Agency reached an agreement with the Department of Agriculture on May 16 to (1) build access roads to hitherto inaccessible government timber stands and thus increase our lumber supply, (2) obtain Forest Service preference for bidders for national forest timber whose output would result in maximum production of materials needed for the Veterans Emergency Housing Program, and (3) overcut timber beyond normal yield for an emergency period in certain localities of the South and West.

PROVISIONS OF THE HOUSING ACT

The Veterans Emergency Housing Act, passed by Congress on May 22, reaffirmed the powers granted the Housing Expediter by the President. It (1) authorized $400,000,000 for premium payments to stimulate production of critically-needed materials; (2) restored Title VI of the National Housing Act to operation by adding $1,000,000,000 to the amount of home mortgage loans made by private lending institutions which the Federal Housing Administration may insure under this Title, while permitting the Federal Housing Administration to insure mortgage loans up to 90 per cent of the "necessary current cost" on the property involved, including land; (3) authorized the Housing Expediter to guarantee markets for prefabricated houses and new types of materials; (4) provided $15,000,000 for the building of access roads; (5) permitted the sum of $5,400 for a mortgage loan on a single-family house, with a provision that it could be raised to $8,100; (6) ordered preference on all new construction built with FHA-insured mortgages under Title VI occupancy to be given to veterans and servicemen; and (7) authorized the Housing Expediter to control exports of housing materials.

PREMIUM PAYMENT PLANS

The first premium payment plan authorized under the Veterans Emergency Housing Act became effective June 1. It set up a system of incentive payments to manufacturers of structural clay products, one of the most critically short building materials; under it producers would be paid $5 for each 1,000 standard brick equivalents manufactured over established quotas. By Nov. 1, 16 premium payment plans were in effect, covering the major critical building materials.

OTHER SUPPLY PROBLEMS

By mid-year it was apparent that authorized non-residential construction was draining an undue amount of critical building materials away from home building. At the request of the Housing Expediter, the Civilian Production Administration ordered its field offices on May 30 to reduce the dollar value of non-housing construction authorizations by two-thirds for at least the next 45 days to keep building in line with materials supply. Permitted non-housing construction was subsequently curtailed twice.

July, August, and September saw further amplification of the Veterans Emergency Housing Program. In July, 26 Army and Navy installations were turned over to the program through the War Assets Administration, 21 materials were ordered set-aside for housing, Army and Navy nail supplies were drawn upon to supply home builders, and super-HH priorities were established for a 30-day period to rush completion of 100,000 temporary housing units during the next three months.

The major action of August was the announcement of the "big push" to get more materials into veterans' housing, so that more homes could be completed before winter set in and more new home construction get under way. The "push" consisted of (1) setting-aside a much greater proportion of scarce building supplies for housing; (2) adding many critical building items to the list of materials under priority control; (3) obtaining stricter compliance by closer inspection of the sale of building materials, and (4) cutting the volume of non-housing construction sharply with a more rigorous review of the essentiality of such construction. "Set-asides" were increased to make it possible for priority holders to obtain needed building materials more rapidly. This was done not only by increasing the proportion of material which must be held by dealers for priority orders, but also by requiring the dealer to hold this material until a priority order was presented. Heretofore the dealer had been required to "set-aside" this material for only 21 to 30 days for priority orders, after which time he could sell to any purchaser.

Further actions were taken during October to speed up the flow of materials to veterans' housing. More building materials were placed under priority ratings and more were ordered "set-aside." In addition, guaranteed markets were signed with three firms producing prefabricated housing. A fourth was signed in November, with several others pending.

ACCELERATION OF THE VETERANS PROGRAM

By Dec. 1, a recapitulation of the results of actions taken by the Veterans Emergency Housing Program showed both a sharp increase in building materials and a near record-breaking rate of homebuilding. While the obstacles encountered by the program—work stoppages in basic industries, the time required to obtain needed legislation, uncertainties about the fate of price control during crucial early stages of the program and failure of prefabricated housing to meet anticipated production goals—made it clear that the original goal of 1,200,000 homes and apartments under construction by the end of 1946 would not be reached, the record was impressive.

The record showed not only 950,200 dwelling units started and 584,300 completed, but also sharp increases in building materials production: monthly lumber output in October was 3,400,000,000 board feet—more than in any preceding month of 1946 except the peak month of August; November production of practically all plumbing fixtures set new all-time records. Average daily production of cast iron soil pipe and warm-air furnaces stood at the high levels established in October. Many of these production increases were owing to such government aids as materials allocation, price adjustments (over 250 in 1946), priorities assistance for raw materials and equipment, and premium payment plans. Over 700 Mayors' Emergency Housing Committees had been organized to plan and direct all phases of the local attack on community housing problems.

Thus, by the end of November, homebuilding had risen from the low wartime level to one of the highest levels in 20 years. Production of most building materials jumped to record or near-record levels and ranged from 50 to 100 per cent higher than during the early months of 1946. Even the removal of price controls on building materials on Nov. 4 was less serious than it would have been without such production in nearly every field of building materials.

REVISION OF THE VETERANS HOUSING PROGRAM

During December the Veterans Emergency Housing Program underwent considerable revision. The Office of the Housing Expediter and that of the Administrator of the NHA were separated. Several restrictions were lifted: the priority system, the $10,000 sales ceiling on new homes, and the confining of new homebuilding for personal occupancy of veterans. The limitation on non-residential construction was modified, and the ceiling of $80 for rental of new projects was changed to an average monthly rental of $80. The Federal Housing Administration was granted $1,000,000,000 additional of insurance authorization to be used primarily for rental housing. The guaranteed market plan, export controls, and apprentice training and technical research programs were to be continued. In announcing the new program, the President stated that the main point of emphasis in 1947 would be rental housing.

FEDERAL HOME LOAN BANK ADMINISTRATION

The Federal Home Loan Bank Administration directs the operations of the Federal Home Loan Bank System and the Federal Savings and Loan Insurance Corporation, two permanent agencies established to encourage home ownership and economical home financing and to protect savings. The Administration supervises Federal savings and loan associations. FHLBA also directs the Home Owners' Loan Corporation, an emergency agency founded during the depression to aid distressed home owners who faced foreclosure. HOLC is now in liquidation.

FEDERAL HOME LOAN BANK SYSTEM

Established in 1932, the Federal Home Loan Bank System provides a nationwide home-mortgage credit reserve for thrift and home-financing institutions somewhat comparable to the Federal Reserve System in the field of commercial banking. Eleven regional Federal Home Loan Banks serve member home-financing institutions in their respective areas by making short-term and long-term loans to them. Through the regional banks, funds may be shifted from areas of abundant credit to areas of scarcity. Since their establishment, they have advanced $1,872,000,000 to their member institutions, of which $234,762,000 was outstanding on Sept. 30, 1946.

Of the 3,702 member institutions of the System, 3,665 are savings and loan associations, cooperative banks, and homestead associations. Of the remaining member institutions, 25 are mutual savings banks and 12 are insurance companies. Assets of members amount to more than $9,696,000,000. The System is self-supporting.

FEDERAL SAVINGS AND LOAN ASSOCIATIONS

Under a law enacted in 1933, the Federal Home Loan Bank Administration is authorized to charter and supervise Federal savings and loan associations, which are private mutual savings and home financing institutions. Charters may be granted to newly organized institutions or those converting from state charter. On Sept. 30, 1946, there were 1,474 such associations in operation with combined assets of $4,470,000,000. Federal associations are required to be member institutions of the Federal Home Loan Bank System and must be insured through the Federal Savings and Loan Insurance Corporation.

FEDERAL SAVINGS AND LOAN INSURANCE CORPORATION

In 1934 Congress provided an insurance program for investors in savings and loan associations and similar home-financing institutions by creating the Federal Savings and Loan Insurance Corporation. Insurance is optional for state-chartered associations. Public confidence, inspired by the fact that investments are so safeguarded, has encouraged the flow of funds into insured associations. About 4,751,000 investors in 2,497 savings and loan associations, with combined assets of more than $7,012,000,000, are now protected by insurance up to $5,000 each. The FSLIC is self-supporting.

HOME OWNERS' LOAN CORPORATION

During the three years after its creation in 1933, the HOLC refinanced delinquent mortgages on more than 1,000,000 homes by providing low-interest long-term loans, which since then have enabled most of the owners to retain their homes. In these rescue operations, $3,093,000,000 was loaned, an amount later increased to nearly $3,500,000,000 through advances to borrowers and other costs.

Up to Oct. 31, 1946, about 81 per cent of this investment had been liquidated by collections on the loans and the sale of properties securing its mortgages which HOLC was obliged to foreclose. A balance of $666,000,000 was outstanding on that date.

Since 1936 the primary functions of the Corporation have been to collect payments due and liquidate its assets, as well as to aid its borrowers to meet their payments. Although the agency acquired a total of 198,189 houses, all but 144 have been sold. Most of them were marketed before the outbreak of the war and the ensuing boom in real estate values.

On Oct. 31, 1946, the remaining number of borrowers' accounts had been reduced to 399,875. About 604,000 borrowers and purchasers of HOLC houses had paid off their mortgage balances in full.

During the 12 months ended Oct. 31, HOLC made a net operating profit of $23,000,000 after paying all administrative and other costs, plus bond interest. The cumulative losses of $338,000,000 taken by the Corporation in the sale of houses it was obliged to foreclose over the years of its operations had been reduced by net earnings to a balance of $28,000,000 on Oct. 31.

It is now apparent that, when liquidation is completed, the Corporation will be able to pay back to the U. S. Treasury its $200,000,000 of original capital intact, plus a moderate return. Probable losses ranging up to $1,000,000,000 had been widely forecast when the Corporation was set up in 1933 to aid insolvent home owners, relieve distressed financial institutions of defaulted loans, and restore deflated real estate and mortgage values.

FEDERAL HOUSING ADMINISTRATION

The Federal Housing Administration was established in June, 1934, by the National Housing Act "to encourage improvement in housing standards and conditions, to create a sound mortgage market, and to provide a system of mutual mortgage insurance."

Under the Veterans Emergency Housing Program, the FHA is the operating constituent of the NHA which processes and issues priorities on materials for housing for veterans. It also insures home loans which meet FHA conditions.

The FHA does not lend money but insures residential mortgage loans made by private lending institutions and also insures lenders on property improvement loans. The maximum interest rate, under Title II of the National Housing Act, is 4½ per cent plus the FHA insurance premium of ½ of 1 per cent, both calculated on annual outstanding balances.

In peacetime, FHA insurance normally is governed by Titles I and II of the National Housing Act. Title VI was added as a defense war measure.

Title I provides for FHA insurance of qualified financial institutions on loans for property improvements, alterations, and repairs. Although loans for those purposes ordinarily are limited to a maximum amount of $2,500 and a maximum term of three years, loans up to $5,000 for terms up to seven years are insurable if the funds go to provide additional housing accommodations for veterans. Title I loans are repayable in monthly installments.

Title II provides for insurance of mortgage loans ranging up to $16,000 made by approved lending institutions. All loans are amortized in monthly payments and under certain circumstances may be repaid over periods of as long as 25 years.

Title VI was added to the National Housing Act specifically to assist in providing housing for defense and war workers. A separate Housing Insurance Fund, non-mutual in character, was established. FHA temporarily stopped taking applications for Title VI loans in September 1945 when its authorization was virtually used up, but such insurance was resumed in May 1946 upon the approval of the Veterans Emergency Housing Act.

Mortgages insured under Title VI are limited to a maximum of $5,400 on a single family house; $7,500 on a two-family house; $9,500 on a three-family house; and $12,000 on a four-family house. Insured loans may cover up to 90 per cent of necessary current costs. In areas where builders can not provide sound standards of construction, design, or livability within these limits, the Federal Housing Commissioner may permit maximum mortgage amounts up to $8,100 on a single family house; $12,500 on a two-family house; $15.750 on a three-family house; and $18,000 on a four-family house.

Title VI authorizes FHA also to insure mortgages on large-scale rental projects for a maximum of 90 per cent of FHA cost estimates.

Before FHA resumed Title VI insurance in May, 1946, with a total insurance authorization of $1,800,000,000, it had insured loans for approximately 450,000 dwelling units for war workers. Amendments permit FHA to issue additional insurance up to $1,000,000,000 for housing for veterans and members of the armed forces. This may be increased with the approval of the President by an additional $1,000,000,000.

From July, 1940, up to the surrender of Japan, more than 750,000 new privately financed dwelling units went into construction under FHA inspection.

The long-term program of the FHA has enabled more than 1,760,000 families to build, purchase, or refinance their homes or to rent modern quarters. FHA insurance written under Title II amounted to more than $5,442,000,000 as of Nov. 30, 1946, and FHA insured property improvement loans under Title I exceeded 6,064,000 in number and aggregated $2,427,000,000.

In addition to being self-supporting, the FHA has been able, under the participation provisions of the Mutual Mortgage Insurance Fund, to declare on certain groups of mortgages 41,000 dividends through March 31, 1946. By Jan. 1, 1946, equity balances had accumulated in a total of 81 groups. Dividends will be received eventually by approximately 226,000 mortgagors who still remained in these groups on that date.

FEDERAL PUBLIC HOUSING AUTHORITY

The Federal Public Housing Authority has responsibility for federally financed public housing functions. At the beginning of 1946, the FPHA had four principal assignments:

1. To provide approximately 200,000 emergency temporary housing units for veterans, in cooperation with educational institutions and local bodies, by relocating and converting surplus war housing and military structures for re-use.

Completion of 200,000 temporary units is one of the goals of the Veterans Emergency Housing Program. Title V of the Lanham Act, as amended by the Mead-Lanham Resolutions of December 1945 and March 1946, authorized appropriations of $445,627,000 to pay the Federal cost of the re-use program. Approximately 180,000 units are expected to be moved and remodeled at Federal expense.

2. To provide Federal aids for low-rent housing built before the war or deferred because of the war and to convert war housing under the United States Housing Act to low-rent status.

Before the outbreak of war interrupted construction of public low-rent housing, local housing authorities in 173 communities built 334 projects containing 105,600 units for low-income families formerly living in slum dwellings. Projects are financed with loans from the FPHA or private investors; all loans are being repaid in full, with interest, in accordance with established amortization plans. To help keep rents within the means of low-income families, the FPHA makes an annual contribution, or subsidy, which for 1945 totaled $7,414,000 or $6.03 per dwelling unit per month. To Dec. 31, 1945, Federal subsidy payments totaled $46,790,040; this represents the entire cost to the Federal Government since the beginning of the low-rent program. In addition, the local community is required to make an annual contribution equivalent to at least one-fifth of the Federal contribution. This local contribution is made normally by exempting the projects from state and local taxes, as authorized by the United States Housing Act and state housing laws.

When the war began, only half of the program authorized under the United States Housing Act had been completed. Units under construction at that time were completed with the aid of priorities to house lower-income war workers and, after V-J Day, were turned back to full low-rent use. Additional war housing projects were built under Public Law 671, which authorized the use of low-rent housing funds for war housing construction. Early in 1946, after a Presidential finding that they were no longer needed to serve war needs, some 33,000 units in P. L. 671 projects were converted to low-rent status. Altogether, low-rent housing funds had provided 62,000 units for war workers. Some 21,000 low-rent units scheduled in areas not requiring more war housing were deferred, pending availability of building labor and materials. As of Nov. 1, 1946, the total housing built or authorized under the United States Housing Act comprised 193,643 dwellings in 747 projects.

3. To manage public war housing during the period of reconversion and demobilization for distressed families of veterans and servicemen, for certain civilian employees of the War and Navy Departments and of private industries completing war contracts, and for distressed families dislocated as a result of the war or demobilization.

The major wartime function of FPHA was to provide publicly financed housing for in-migrant war workers and their families; the FPHA was responsible for the construction and management of about four-fifths of the total provided. The remainder was provided by other agencies, principally the War and Navy Departments and the United States Maritime Commission. For the total public war housing program, some $2,500,000,000 was made available, all from Congressional appropriations or loan authorizations except $29,000,000 expended by the New York State Division of Housing.

From these funds some 856,000 accommodations were provided for in-migrant war workers and their families. All but 16,000 of these units had been completed by December 31, 1945. The war housing completed includes 590,000 family dwelling units, 169,000 dormitory units, and 81,000 trailers, portable shelters, and other forms of stop-gap housing. These figures include accommodations made available by re-use of trailers and temporary or demountable units that were moved from one location to another.

In addition to veterans accommodated by the relocation of surplus facilities, on Nov. 1, 1946, 272,000 veterans' and servicemen's families were living in public housing remaining at its wartime location. Such families accounted for over 44 per cent of all occupied war and low-rent housing units in programs administered by the FPHA.

4. To dispose of federally owned housing surplus to the above needs.

The FPHA on Nov. 1 had some 523,000 units completed or under construction contract to dispose of when surplus to veterans' and other demobilization needs. These include 244,000 temporary units, which must be removed within 2 years after the emergency; 184,000 permanent units, including 113,000 of standard construction, and 71,000 demountables which may be dismantled and reerected at new locations; 14,000 permanent family units, built with U. S. Housing Act funds and presently used as war housing, to be turned over to the use of low-income families; 35,000 trailers; and 46,000 family and dormitory units converted from existing structures, mostly under lease from private owners.

Other FPHA housing includes: (a) 50 projects built by PWA and operated as low-rent housing; (b) 30 subsistence homesteads projects, which were transferred from the Farm Security Administration and are being disposed of; (c) three Greenbelt towns which were transferred to FPHA in 1942 for management and eventual disposition; and (d) seven limited dividend projects constructed by private corporations with the aid of government loans. Mortgages on four have been sold, and the remaining three may also be sold.

PRISONS AND CRIME CONTROL

By James V. Bennett
Director, U. S. Bureau of Prisons

TRENDS IN PRISON POPULATION

The population of state and Federal prisons and reformatories decreased from 165,585 in 1940 to 127,076 in 1944, a decrease of 23 per cent. From 1944 to 1945, the inmate population had increased by only 795, but there are indications since that the substantial increase in prison commitments predicted for the post-war period may soon materialize. From Sept. 30, 1945 to Sept. 30, 1946, there was an increase of 6 per cent in the population of state institutions: there has been no such increase in Federal prisons despite the fact that about 1,000 prisoners were transferred from the armed forces. The population of Federal institutions stood at 18,170 at the end of September 1946 as compared with 18,962 in September 1945. This slight decrease can be accounted for mainly by the release of violators of special wartime laws, particularly the Selective Training and Service Act, of whom more than 11,000 have been committed since 1940. In December 1946, less than 1,500 remained in confinement. Of these, 455 were Jehovah's Witnesses and less than 50 were conscientious objectors.

This latter group petitioned during 1946 for release of selective service violators and specifically for amnesty for those with religious objections. By means of hunger fasts, picket lines, and even sit-down strikes, they brought their plea to public attention, but to date no amnesty has been issued.

ARMY AND NAVY CORRECTIONAL PROGRAMS

These two branches of the service continued to make progress in the field of enlightened treatment and rehabilitation of the offender in uniform. The number of men in Army custody dropped from the previous year's high of 35,800 to 13,900. While comparable Navy figures show a reduction from 16,100 to 8,800, of whom 1,400 were awaiting trial, the remainder being under sentence. These figures do not include a total of 3,913 in the custody of the Federal Bureau of Prisons, by transfer from military or naval installations. These long-term or serious offenders comprise 3,862 committed by the Army and 51 by the Navy.

Army and Navy correctional programs, staffed during the war by career persons drawn from civilian agencies, while now manned by regular Army and Navy personnel, nevertheless continue the high standards and the progressive programs initiated during the war years. The War Department has restored to active duty more than 24,000 court martial prisoners. The Special Clemency Boards set up by the Under Secretary of War reported they had reviewed a total of 28,400 sentences. With the completion of this work, all men still serving court martial sentences will have their cases reviewed annually. It is estimated that by 1950 less than 1,500 of these military offenders will continue in custody.

In December 1946, the Army opened its newest disciplinary installation at Camp Cooke, California. This institution, patterned after the Federal Penitentiary at Terre Haute, Indiana, and under the command of Col. J. W. Fraser who formerly headed the War Department Correction Division, will, it is hoped, ultimately supplant the old military prison at Fort Leavenworth now long outmoded.

The Navy announced a change in the names of its Naval Prisons at Portsmouth, New Hampshire, and Terminal Island, California, to Naval Disciplinary Barracks, in line with the rehabilitation being carried out at those two institutions. The War Department, in adopting a policy of parole supervision for men discharged before full expiration of sentence. gave a further indication of its acceptance of modern correctional standards, and integrated its program of treatment. Federal probation officers are expected to supervise Army parolees, as they now do parolees from Federal penal and correctional institutions.

STATE PENAL DEVELOPMENTS

Florida, Oregon, West Virginia, Louisiana, Washington, and Ohio made considerable progress in the evaluation of their entire penal programs. Florida will probably have a new women's institution and a new reformatory as a result of this survey, and West Virginia bids fair to reorganize entirely its system of institutions and county jails.

California, after five years' experience with the Youth Correction Authority Act, paused to appraise the effectiveness of its operation and to plan for further implementation of the provisions of this legislation. The Youth Correction Authority Act idea is the most hopeful forward step that has been taken in American criminal justice in the past decade. Of the many states which have in recent years looked into the provisions of this act, Minnesota is among the most recent. The Federal Corrections Act was again introduced with the hope that its passage would give prison administrators a greater opportunity to plan for the rehabilitation of the men entrusted to their care without the restrictions now imposed by the fixed sentences under which men are committed to Federal custody.

It was only 15 years ago that Congress enacted a bill under the provisions of which the judges, instead of committing directly to one institution, sentenced men generally to the custody of the Attorney General. At first this act met considerable opposition from some of the judges but this statute is now generally accepted and approved. Under it, sentenced prisoners are not sent to an institution by the court until their previous background has been studied and appraised and an estimate has been made of their likely response to one of the 27 institutions under the supervision of the Department of Justice. After further observation, the classification committee at the institution decides whether their needs would not be better served by transfer to another institution.

This same flexibility is the core of the English Criminal Justice Bill originally introduced in Parliament in 1939. Postponed because of the war, this bill will again be brought up for consideration as soon as some of the more important Labor Party proposals have been disposed of. American students and practitioners in the criminal justice field will await with interest the results of this significant new effort to integrate and rationalize the sentencing, treatment, and release of persons convicted of crime.

THE LOCAL JAIL

The local jail is a perennial topic of discussion and appraisal, and rightly so, because of the fundamental part which the county jail plays in the total picture of crime control and treatment. Like the local court, the largest proportion of offenders pass through the local jail, and their penal experience goes no further. All accused awaiting trial who can not make bond, some witnesses, many children, and too many alcoholics and prostitutes, for whom no other form of treatment has been devised, know the inside of the local jail.

Since the Federal Bureau of Prisons boards an average of between 3,000 and 4,000 prisoners annually in non-Federal jails, it has for many years maintained an inspection service for the purpose of approving those which come up to its standards and refusing to contract for the boarding of Federal prisoners in those which fall too far below it. To the end of the year, only 444 of the 3,127 county and city jails inspected since 1930 were fully approved for Federal use. This constitutes only 14 per cent, and of these, four-fifths rated less than 60 per cent on the scale used to appraise such matters as food, cleanliness, supervision, and safety. Eighty-two per cent of the jails inspected in the past 16 years rated less than 50 per cent on this scale; only 2 per cent rated 70 per cent or above.

The condition of jails generally in the year following the close of the Second World War provides little basis for optimism. Only 30 per cent of the jails inspected in 1946 appeared to have improved as compared with prior inspections, while 47 per cent appeared to be worse. The conclusion is inevitable that most local jails—institutions which lie completely within the administrative domain of sheriffs or other locally elected officials—continue to constitute a disgrace to our democracy. Deplorable jail conditions must be attributed in part to the indifference of the local citizenry where such conditions are allowed to continue. In this regard it is hoped that the recent wave of public interest and indignation following upon a series of articles in two popular magazines will go far to awaken the ordinary citizen to his responsibility in this connection. Until this public concern is reflected in standards far above what are commonly accepted by our communities, the jail will continue to be a national disgrace and a source of corruption at the very root of crime control, largely undoing all that may be attempted in the way either of crime prevention or of decent and humane treatment at the prison level.

JUVENILE DELINQUENCY

The office of the Attorney General has in recent years provided leadership in the field of crime control. Under Attorney General Mitchell, the Wickersham Commission explored the phenomenon of gangsterism and laid the foundations of a policy which resulted in the reduction of that menace to civil order. Homer Cummings, in 1934, called a conference to review the general picture of crime in the United States, and measures to be taken to meet it. Frank Murphy, as Attorney General in 1939, called the Conference on Release Procedures at a time when parole had fallen into disrepute because of attacks launched against it in high places.

It is quite in the order of things, therefore, for Attorney General Clark to have issued a countrywide call to a Conference for the Prevention and Control of Juvenile Delinquency. Meeting in Washington Nov. 20-23, the Conference for the first time made a well-rounded national presentation of the factors conducive to the development of delinquent careers and the measures which should be taken to correct them. It was the expressed intent of the delegates to pursue the problem further with regional and local conferences which will take up from where the national conference left off. The proceedings of the conference are awaited with great interest and may well prove to be the most important contribution to date to the literature in this field.

The indivisibility of the entire field of crime control is emphasized by the calling of this national assembly to consider the more effective prevention and treatment of criminal conduct. The conviction grows that the various local and state jurisdictions must integrate their programs on a national basis; recent mobility of population has demonstrated that state lines are no barrier to criminal behavior; that the state which does not effectively prevent crime or treat the offender within its borders has no sure guarantee that its laxity may not be matched by the indifference of another state. The boundaries of crime are national not statewide, and it may be expected that 1947 will see many signs of the acceptance of this fact.

INTERNATIONAL PENAL AFFAIRS

The chief development of note in this field was the revival of interest in the International Penal and Penitentiary Commission, with headquarters at Berne, Switzerland. This Commission was originally established through the efforts of an American penologist, Dr. Enoch Wines, in 1870, and it is therefore fitting that an American, Sanford Bates of New Jersey, now leads the organization as it heads into a period of constructive post-war activity. The Economic and Social Council took note of international penal affairs when it charged the newly created Social Commission to undertake, as one of its functions, responsibility for the development of an international program for the prevention and treatment of crime and criminals. The precise place of the International Penal and Penitentiary Commission under the United Nations is not yet determined as this is written, but there is ample assurance that some machinery will be developed which will make possible an interchange of ideas, information, and personnel among United Nations members as to progressive developments in the field.

The influence of the American viewpoint on penal affairs in occupied Germany and Japan seems to be growing. The Allied Control Commission for Germany accepted a set of basic penological principles to govern the administration of German prisons which was prepared by the American representative. These principles provided for more liberal treatment than characterizes the Continental systems. It abolishes, for instance, corporal punishment and enunciates the principle that prisoners should be permitted a certain amount of group recreation and exercise, contrary not only to the system that prevailed in Nazi Germany, but in some other European countries as well. The prisons of Japan are likewise under the supervision of an American penologist who is modernizing these institutions and bringing their methods in line with the program and philosophies of the Western nations.

DIVISION XVI

LABOR AND LABOR LEGISLATION

LABOR CONDITIONS AND LEGISLATION

By Witt Bowden
Bureau of Labor Statistics, Department of Labor

GENERAL

An outstanding achievement of 1946 was the virtual completion of the return of war workers and the armed forces to peaceful pursuits. Monthly estimates of total unemployment ranged from 2,700,000 in March to 1,930,000 in November. Extremely large shifts in employment were made from munitions industries to the production of ordinary civilian goods and services and from war-industry centers to other communities. These shifts relieved but did not remove the pressure of civilian demand on supply. At the same time, the radical employment shifts gave rise to grave problems of readjustment of workers. These problems were aggravated by declines in earnings, rising prices, housing and other shortages, and the difficulties of transition from wartime stabilization by public agencies to voluntary collective bargaining and price determination.

Collective bargaining over wages broke down in several major industries, and the early months of the year were marked by exceptionally severe strikes. By a combination of work stoppages, peaceful collective bargaining, and the mediatory efforts of the Conciliation Service and fact-finding boards, extensive wage advances were obtained by midyear. In many employments, however, these increases were not sufficient to counteract reductions in weekly earnings owing to loss of high-wage jobs, overtime, and premium pay.

The lapse of price controls in July, adoption of radically modified controls, and final decontrol were accompanied by sharp increases in prices and also by advances in corporate profits and farm income. Workers in turn demanded a "second round" of wage increases, and either began negotiations or prepared for renewal of agreements with higher wage rates early in 1947. Prominent in the "second round" of demands was the attempt of the United Mine Workers to terminate the agreement of May 29, 1946 made with the Government after the mines were seized to end a strike, but the effort was suspended pending an appeal by the union from adverse court action.

Labor unions retained most of their wartime membership gains and collective-bargaining coverage but found themselves confronted by renewed demands for restrictive labor legislation, particularly to curb strikes. By the end of the year, there were no important work stoppages, and steps were being taken, particularly by the Labor-Management Advisory Committee formed by the Conciliation Service, to work out more effective procedures for the peaceful settlement of disputes on a voluntary basis.

EMPLOYMENT AND UNEMPLOYMENT

Outstanding in importance in the world of labor was the maintenance of employment at high levels. Throughout the reconversion period to the end of 1946, the largest reported volume of unemployment was the March estimate of 2,700,000. The estimate for November was 1,930,000. This record was achieved during the curtailment of Federal expenditures for war and defense activities from $8,246,000,000 in March 1945 to $1,100,000,000 in September 1946, a reduction accompanied by the rapid demobilization of the armed forces and the sharp curtailment of employment in war industries.

Unemployment was kept within unexpectedly moderate bounds partly as a result of the rapid recovery of civilian production. The peak of production and employment in many war industries was reached in 1944 and early in 1945, and reconversion thus began before the end of the war. Most of the nondurable-goods industries and service industries required no extensive reconversion work and began to expand while war industries were undergoing cutbacks. The number of women in the civilian labor force, at its peak of 20,080,000 in July 1945, was only 17,400,000 in July 1946. Large numbers of children and older persons who took wartime jobs also voluntarily withdrew from the labor market. Unexpectedly large numbers of veterans took advantage of the Government's offer of educational assistance or for other reasons deferred their quest of jobs. Sharp reductions in overtime hours of work below wartime levels also tended to restrain the rise in unemployment.

The extent of transition to peacetime production and employment is indicated broadly by estimates of employment in non-agricultural establishments. The number fell from 37,273,000 in July 1945 to 35,231,000 in October but rose by November 1946 to about 40,600,000.

By November 1946, veterans had been largely reabsorbed into the employed labor force. More than 13,000,000 male veterans had been discharged; 10,680,000 of these were employed; 1,100,000 were in schools; 700,000 were reported as unemployed; and 550,000 were on vacation or had retired or were unable to work. By November, monthly job placements of disabled veterans had tripled since February.

RECONVERSION SHIFTS IN EMPLOYMENT

The overall picture of employment and unemployment gives little indication of the remarkable extent and rapidity of industrial and regional shifts in employment. Industrial shifts are strikingly illustrated by the transportation equipment group. In January 1944, employment in that group (excluding automobiles) was 2,611,000; in July 1945, the number was 1,577,000; and in October 1946, after a virtually uninterrupted decline, only 442,000. In another industry group, the stone, clay, and glass products industries, employment fell with American entry into the war from 396,000 in November 1941 to 310,000 in September 1945 but rose to 411,000 by October 1946. The extent of change in many of the individual industries was much more extreme.

Reconversion declines in employment were usually in high-wage industries. Thus, in the transportation equipment group, hourly earnings averaged $1.301 in July 1945, in contrast to an average of only $0.931 in stone, clay, and glass products, with rising employment. In textile mill products, with employment rising from 1,051,000 in July 1945 to 1,224,000 in October 1946, hourly earnings in July 1945 averaged only $0.763. A major gain in employment outside of manufacturing occurred, however, in construction, with relatively high wages. Estimated total employment in construction, including salaried workers, rose from 911,000 in July 1945 to 2,084,000 in October 1946.

The gravity of reconversion problems of reemployment, despite the favorable overall status of employment, is indicated by regional changes in factory employment. Changes in a few selected metropolitan areas between July 1945 and October 1946 are shown, by way of illustration, in the accompanying table. It should be noted, in addition, that declines in employment had occurred in many war industries before July 1945, so that employment in that month was commonly already below the wartime peak.

INDEXES OF FACTORY EMPLOYMENT IN SELECTED METROPOLITAN AREAS, JULY 1945 AND OCTOBER 1946

(1937 = 100)

	July 1945	October 1946	Per Cent Change
Albany, N. Y.	111.1	93.4	−16
Columbus, O.	144.6	108.8	−25
Dallas, Tex.	207.1	129.0	−38
Dayton, O.	109.6	137.6	+26
Des Moines, Ia.	266.6	139.3	−48
Duluth, Minn.	189.6	79.5	−53
Erie, Pa.	124.9	141.1	+13
Grand Rapids, Mich.	78.6	103.0	+31
Jacksonville, Fla.	161.9	88.3	−45
Kansas City, Mo. and Kan.	190.0	104.9	−45

Workers in the new establishments for making aircraft, ships, explosives, and other military goods had moved to these plants from various other industries and often from distant parts of the country. The return of these workers and of millions of veterans to peacetime pursuits created grave problems not merely of reemployment but also of occupational readjustment and maintenance of earnings and standards of living.

WAGE DEMANDS AFTER V-J DAY

Labor-management disputes were mainly over wages. Family earnings during the war had risen partly by virtue of wage-rate increases but even more largely because of a longer work-week, premium pay for overtime and extra shifts, opportunities for jobs in high-wage employments, and work by additional members of many families. Much of the increase was therefore temporary. Average weekly earnings in manufacturing had begun to decline before V-J Day and had fallen from $47.50 in January 1945 to $40.87 in September 1945. In some industries the decline was much greater; in the transportation equipment group (excluding automobiles) the average fell from the December 1944 peak of $63.33 to $46.56 in November 1945.

In many industries the wage-rate advances throughout the war period had been restricted to substantially the 15 per cent increase allowable under the Little Steel Formula. In contrast, the prices of consumers' goods and services had risen 28.2 per cent between January 1941 and August 1945. Real earnings were also affected adversely by scarcity, decline of quality, and other factors not fully reflected in the price advances.

Workers were inclined to make wage demands on the basis not only of the decline in weekly earnings but also of the relative status of wages and other types of income. Reports of continued increases in non-wage income, such as corporate profits and farm income, while weekly earnings were declining, were widely viewed as a basis for substantial advances in wages.

The termination in August 1945 of the pledge against work stoppages and the relaxation of public controls of wages, hours, and prices gave renewed importance to collective bargaining. The efforts of the Labor-Management Conference in November 1945 to work out a general basis of agreement to take the place of the wartime arrangements achieved no substantial success, and normal procedures for adjusting differences proved to be inadequate to meet the immediate post-war situation.

LABOR-MANAGEMENT DISPUTES IN THE EARLY RECONVERSION PERIOD

Petroleum.—An early demand for a wage-rate increase to cushion the fall in earnings due to reduction of hours and premium pay was made by the Oil Workers International (CIO). An advance of 30 per cent in wages was demanded, a rise that would maintain weekly earnings at straight-time with a 40-hour week at about the same level as with the 48-hour week including time and one-half pay for hours above 40. The controversy involved a partial work stoppage on Sept. 17, 1945, seizure of major plants on Oct. 4 by the Navy Department, and the appointment, on Nov. 27 of a fact-finding panel. The panel on Jan. 12, 1946 recommended an increase of 18 per cent, which certain companies had already negotiated with the union. Final settlement by major companies was made on that basis.

Automobiles.—A strike of about 200,000 General Motors Corporation employees, beginning Nov. 21, 1945, was not ended until March 15, 1946. The main demand of the union (UAW-CIO) was a 30 per cent increase in wages. The union based its demand on the ability of the company to meet the demand without increases in prices. The company refused to participate in hearings before the Presidential fact-finding board, appointed to study the dispute, on the ground that the company's ability to pay was not a proper subject of inquiry by the board. On Jan. 10, 1946, the board recommended an increase of 19.5 cents per hour. The company rejected the recommendation, but on Feb. 11 offered 18.5 cents per hour, an offer which was rejected in turn by the union. The final agreement on March 13 provided, however, for an increase of 18.5 cents per hour with certain supplementary adjustments, including improved vacation pay.

Electrical Equipment.—Three major work stoppages began in January 1946—in the electrical equipment industry (Jan. 15), meat packing (Jan. 16), and steel (Jan. 21). In the electrical equipment industry, the United Electrical, Radio and Machine Workers called out about 200,000 members in an effort to enforce the demand for an increase of $2 per day. Workers in the General Motors Corporation's electrical division agreed early in February to an increase of 18.5 cents. On March 14, a similar agreement was made with the General Electric Co. The Westinghouse settlement for 18 cents, with certain supplementary adjustments, was not made until March 9.

Meat Packing. — The unions involved in the meat packing dispute included those affiliated with both the AFL and the CIO. Their demands, although differing in detail, called chiefly for increases in rates to compensate for declines in earnings due to actual or expected reductions in hours and premium pay. Negotiations, which had extended over several months, culminated in a brief work stoppage beginning on Jan. 16, 1946. Wage demands, together with the claims of the companies to advances in prices if wages were to be raised, involved the entire wage-price stabilization policy. A fact-finding board recommended on Feb. 7 an increase of 16 cents per hour, and the National Wage Stabilization Board on Feb. 26 approved the increase, concurrently with an authorization by the Director of Economic Stabilization of an increase in prices.

Steel.—The dispute in the iron and steel industry, involving the United Steel Workers (CIO), resulted in a strike of about 750,000 men, the largest of all of the work stoppages. The union demanded an increase of $2 per day. The steel companies insisted that the demands would require advances in steel prices contrary to price stabilization policy. The compromise settlement of Feb. 15, 1946 with the United States Steel Corporation and somewhat later with other companies called for an increase of 18.5 cents in wages, concurrently with an advance of $5 per ton in the price of steel.

THE WAGE-PATTERN POLICY

The major wage disputes outlined above resulted in wage advances considerably larger than most of the increases that had been obtained in other employments after V-J Day.

Wage increases generally had been obtained within the existing price structure or on the basis of minor price adjustments permissible under the 33 per cent cost-of-living formula, which had permitted wage increases up to 33 per cent above January 1941, even if price increases were necessary. Recommendations of early fact-finding boards, ranging from 14 per cent in the Greyhound Bus case to 20 per cent in the meat packing case, were made by the boards within the framework of existing wage-price policy. In many similar employments, however, comparable wage increases could be obtained only at the cost of price increases involving a change in wage-price policy. Workers in employments not benefited by the comparatively large increases naturally looked upon these increases as setting a pattern, without regard to the question of price relief demanded by employers. These workers emphasized the maintenance of an equitable wage relationship with those industries in which the larger advances in wages had been obtained.

This problem confronted some of the fact-finding boards, and it came to a head before the NWSB in the meat packing and steel cases. The solution in essence was the adoption of the wage-pattern policy in an executive order of Feb. 14, 1946. That order recognized general patterns of wage adjustment as established in an industry or local labor market area after Aug. 18, 1945. An employer who found it necessary to raise the wages of his workers in order to conform to that pattern could seek price relief to compensate him for all or part of the wage increase.

DISPUTES IN COAL-MINING

The disputes over the renewal of the 1945 bituminous-coal agreement were of outstanding importance because of questions collateral to wages, especially the welfare and retirement fund and safety demands, and because of the role of the Federal Government. The National Bituminous Wage Conference convened in Washington on March 12, 1946. The demands of the union were not at first clearly defined but they included three proposals which deadlocked the conference. These were the demands for a health and welfare fund to be financed by the company and administered by the union, a Federal system of safety standards, and unionization of supervisory, technical, and clerical employees. On March 26, the union gave notice of termination of the agreement. On March 31 the men walked out. A two-weeks' truce was ordered by the union on May 13.

It became apparent that no agreement could be reached during the two-weeks' truce, and on May 21 the President instructed the Secretary of the Interior to take possession of the mines and conduct negotiations with the union. At the end of the two-weeks' truce another work stoppage occurred, but on May 29 an agreement was signed by the Secretary of the Interior as Coal Mines Administrator and the president of the UMWA. The men were then ordered to return to work.

Major provisions of the agreement included a welfare and retirement fund financed by 5 cents per ton on coal and to be managed by trustees, one appointed by the union, one by the administrator, and a third by the other two; a Federal mine safety code, Federal inspection, and mine safety committees to be selected by the local unions; a continuance of wartime hours of work, with overtime rates to be paid after 7 hours per day and 35 hours per week; and a basic hourly increase of 18.5 cents, which, with overtime beyond 7 hours, gave a daily increase of $1.85 for a nine-hour day. The agreement was described by the union as embodying "the greatest economic and social gains registered by the UMWA in a single wage agreement since the birth of the union in 1890." Later events in the industry are described in another connection.

The renewal of the anthracite agreement, which expired on April 30, also gave rise to prolonged negotiations and a nine-day work stoppage ending on June 7. The agreement between the union and the operators followed in most respects the May 29 agreement in bituminous-coal mining.

RAILROAD DISPUTES OVER WAGES AND RULES

The 1946 railroad labor disputes were particularly noteworthy because of their connection with labor legislation, their bearing on inter-union relations, and the tie-up of a vital public utility. In accordance with procedures under the Railway Labor Act, 20 unions served notices on the carriers late in 1945 asking for wage increases, and many of the unions also demanded changes in working rules. The National Mediation Board obtained arbitration agreements between 15 unions of non-operating employees and three of the unions of operating employees (the unions representing conductors, switchmen, and firemen). These agreements waived rules changes. The non-operating employees requested an increase of 30 cents per hour, and the conductors, switchmen and firemen requested an increase in basic daily rates of $2.50.

The two arbitration boards (one for the non-operating and one for the operating group) met in Chicago on Feb. 18, 1946. The award for the non-operating employees was 16 cents per hour and for the operating employees, $1.28 in basic daily rates, amounting, for an eight-hour day, to 16 cents per hour. The 18 unions affected contended that the increases were inadequate and soon after the awards were granted served notices on the carriers that they would seek additional increases in accord with the procedure of the Railway Labor Act.

The two other unions of operating employees, Brotherhood of Railroad Trainmen and Brotherhood of Locomotive Engineers, had rejected arbitration, refusing to waive changes in rules. These two unions set a strike date for March 11, 1946. An emergency board appointed under the Railway Labor Act met concurrently in Chicago with the arbitration boards to hear the demands of the two unions for an increase in basic daily wages of $2.50 and for rules changes. The emergency board recommended the same wage increase as had been awarded by the arbitration boards and also recommended certain changes in rules. The engineers and trainmen refused to accept the recommendations and set a new strike date for May 18. On May 17, the railroads were taken over by the Office of Defense Transportation. The two unions postponed their strike date to May 23, when, negotiations failing, the strike order became effective, forcing a general stoppage of railroad service.

The President intervened, requesting the members of the unions to return to work, and stating that the armed forces would be ordered to run the trains if the work stoppage was not ended by 4 P.M. of May 24. The President on that day appeared before Congress, requesting emergency legislation; but just before the deadline set by the President, the two unions announced that they had signed an agreement with the carriers. The agreement provided for an increase of 2.5 cents per hour beyond the recommendation of the emergency board (a total of 18.5 cents), the addition being in lieu of rules changes. On the same day the other 18 unions signed an agreement with the carriers for an additional 2.5 cents per hour. The railroads were returned to private ownership on May 26, 1946.

INCREASES IN WAGE RATES

For a number of months after V-J Day, few important changes occurred in wage rates. Average hourly earnings of factory workers declined, but their straight-time hourly earnings weighted by January 1941 employment rose about one cent by October 1945. Between V-J Day and May 1946, increases in basic rates of all factory workers averaged about 11.5 cents per hour, including about 21 per cent of the total who received no general increases. Even among those who received increases, 67.5 per cent obtained less than 18.5 cents, an increase which was widely viewed as a general rise. Increases in wholesale and retail trade and various other non-manufacturing groups were materially smaller than in manufacturing; and as a rule, larger percentages of these workers than of factory workers received no increases.

Relatively small wage-rate increases occurred after May 1946. The straight-time hourly earnings of all factory workers combined, when computed in a manner to indicate the approximate change in rates, rose somewhat more than 4 per cent. During May, workers in railroad transportation and coal mining received an increase of 18.5 cents in basic rates. In other non-manufacturing industries, the main increases between May and October were in electric light and power, street railways and buses, metal mining, and quarrying and non-metallic mining. Scattered increases, averaging 4 to 5 cents for all workers, were obtained by employees in wholesale and retail trade.

Farm wage rates continued to advance. The rate per day without board rose from $4.39 in October 1945 to $4.94 in October 1946. The rise was affected only to a slight extent by shifts in regional employment and types of crops; the employment of hired farm workers underwent little change except of a seasonal nature.

CHANGES IN GROSS HOURLY EARNINGS

The gross average hourly earnings of factory workers fell from $1.033 in July 1945 to $0.985 in October of that year. The rise by October 1946 brought the average to $1.130. The early decline was caused by reductions in the proportion of premium payments for overtime and extra shifts and in the relative number of workers in high-wage employments. In durable-goods manufacturing industries, with relatively high wages, average weekly hours fell from 44.9 in July to 41 in September 1945, and employment fell from 7,054,000 to 5,234,000. In non-durable-goods industries, paying lower wages with few exceptions, average hours fell from only 42.8 to 41.8 during the same period, and employment underwent little change. By September 1946, employment in manufacturing had reverted to substantially the relationship existing between durable-goods and non-durable-goods industries in January 1941.

In October 1946, the average of the gross hourly earnings of factory workers was 9.7 cents higher than in July 1945. Straight-time hourly earnings, when computed to measure roughly the changes in wage rates, rose 16.2 cents during the same period. The difference, 6.6 cents, is a rough measure of the effects on hourly earnings of reductions in premium pay for overtime and in opportunities for jobs in high-wage industries.

Increases in average hourly earnings occurred in all industries. In manufacturing industries, the advances between October 1945 and October 1946 ranged from 5 per cent in small-arms ammunition to 27.7 per cent in cotton goods, the average increase in all manufacturing being 14.7 per cent. In the various non-manufacturing industries reporting to the Bureau of Labor Statistics, the increases during the same period ranged from 8.6 per cent in power laundries to 18.4 per cent in copper mining. Reconversion changes reflect in part a movement toward a new post-war equilibrium of wages as between industries after the uneven wartime changes.

CHANGES IN AVERAGE WEEKLY EARNINGS

During the war, weekly earnings rose more rapidly than basic wage rates. During reconversion, when hours were falling and some of the other factors affecting weekly earnings were reversed, declines in earnings in many employments, together with continued advances in prices, pressed seriously on standards of living.

The net effects on average weekly earnings of reconversion changes, such as the downward pressure of reductions in hours and in the relative number of workers in high-wage employments, and the upward pressure of rising wage rates, are illustrated by the following tabulation:

	Average Weekly Earnings					
		Wartime Peak		Reconversion Low (After August 1945)		
	1944	Month	Amount	Month	Amount	October 1946
All manufacturing	$46.08	Jan. 1945	$47.50	Feb. 1946	$40.58	$45.68
Printing and publishing and allied industries	44.13	June 1945	46.93	Oct. 1945	48.01	54.34
Transportation equipment (except automobiles)	60.28	Dec. 1944	63.33	Nov. 1945	46.56	54.22
Retail trade	26.58	July 1945	29.40	Nov. 1945	28.88	33.19

Striking differences are to be noted in the effects of war and reconversion on average weekly earnings. The average in the printing and publishing group, for example, rose very slightly during the war but continued to advance after V-J Day. In contrast, the average for the transportation group rose rapidly to $63.33 in December 1944 and declined even before V-J Day. The reconversion low of November 1945 was $46.56, and the average of October 1946 ($54.22) was still 14 per cent below the wartime peak. In most of the non-manufacturing industries, hours of work underwent relatively little change (coal mining being a noteworthy exception), and weekly earnings generally rose less but also declined less than in manufacturing. In a few of the non-manufacturing industries, no declines occurred.

In manufacturing as a whole, the weekly earnings average in October 1946 was 13 per cent above the reconversion low point but 4 per cent below the wartime peak. The average in October was slightly below the average for 1944 and approximately the same as in the month before V-J Day.

PRICES AND REAL WAGES

Price Trends.—The early reconversion period brought few significant changes in prices. Early in 1946, however, it became apparent that price controls would be radically relaxed. The temporary lapse of controls in July, the final enactment of restricted controls, and the progress of decontrol measures accelerated the price advance. The major part of the increase between V-J Day and November 1946 occurred after May 1946. Between May and November, the consumers' price index rose 15.2 per cent, and the wholesale price index, 25.8 per cent.

Comparative changes in consumers' prices and wholesale prices during war and reconversion are shown in the following tabulation:

	Percentage Increase to November 1946 from ——			
	August 1939	August 1945	November 1945	May 1946
Consumers' prices	53.9	17.3	17.3	15.2
Retail food prices	100.7	33.2	34.0	31.6
Wholesale prices	86.1	32.1	30.7	25.8
Farm products	178.4	33.8	29.5	23.5
All commodities other than farm products	70.5	31.6	31.1	26.4
Foods	146.1	55.5	53.3	48.3

Wage-price Relationships. — Price changes of special significance in relation to wages were the comparatively large increases in the prices of farm products and of both the wholesale and retail prices of foods. During the entire period of war and reconstruction, farm prices rose 178 per cent in contrast to 71 per cent for all other commodities; and farm prices during reconversion continued to advance substantially the same as other commodities. During both the war and the reconversion periods, the advance in the retail price of foods (related closely to the wholesale prices of farm products) rose far more than other consumers' prices, and in the two periods combined approximately doubled the rise in the general level of consumers' prices, including foods.

These trends are doubly significant in relation to wages. First, wages have relatively small effect on farm costs and prices because only about one out of four farm workers is a wage earner. Second, foods form the main item in consumers' prices, and the exceptionally large increase in food prices therefore accounts for the major part of the increase in consumers' prices. The rise in farm prices has also been reflected in relatively large increases in clothing and house furnishings, which are also important items in consumers' prices.

The impact of rising consumers' prices on wages was especially severe in relation to weekly earnings. The effects on real weekly earnings varied widely with different types of employment. Extreme declines in real weekly earnings may be illustrated by the transportation equipment group (excluding automobiles). The average of the real weekly earnings of workers in that group was 27 per cent lower in October 1946 than in December 1944 (peak month of their money earnings). If the average of real weekly earnings of all factory workers in April 1945 (V-E Day, and the approximate beginning of reconversion) is compared with the average of October 1946, the decline in real weekly earnings was about 17 per cent.

In comparison with pre-war periods, real weekly earnings show advances in most employments. The higher current levels reflect in part higher levels of hours of work, with some increases in premium pay, and in part the advances in the productivity of labor. The sharp reconversion declines in real weekly earnings, when profits and farm incomes were rising, nevertheless confronted workers with serious problems during a period of difficult readjustment to new jobs and new living conditions.

DECONTROL AND WAGE-PRICE PROBLEMS

The wage-pattern policy, adopted Feb. 14, 1946, affected price policy by extending the types of wage adjustments for which price relief could be obtained. The strong pressures on price controls exerted by business and farm groups were reflected in the prolonged debates over the renewal of controls, which, according to the existing law, were limited to the period ending July 31. The bill for renewal of controls was passed late in the fiscal year but with such modifications as to fail of approval by the President. A new price control bill, signed "reluctantly" by the President on July 25, followed the temporary suspension of controls. The new act restored rent control, revived some of the food price ceilings on Aug. 20, vested certain powers in a decontrol board, reduced subsidies which had been an important factor in restraining price advances, and liberalized the profit basis for fixing price ceilings.

The difficulties of readjusting the price control machinery to meet the requirements of the new control bill, together with widespread opposition to controls, led to the acceleration of decontrols. This was indicated, for example, by the closing, on Nov. 4, of 1,642 local price control boards, owing to the removal of ceiling prices from the overwhelming majority of commodities supervised by the boards. Immediately after the election, all price controls were abandoned except for the ceilings on rent, sugar, and rice. The breakdown of controls and their final abandonment were attributed by the President to the "unworkable price control law."

In connection with the revoking of price controls, the President pointed out that wage controls after V-J Day had applied only to demands for wage increases that might affect prices, and he stated that the removal of price controls left no basis or necessity for continued wage controls. He therefore, on Nov. 9, issued an executive order terminating all controls designed to stabilize wages and salaries.

In removing price and wage controls, the President stated that the return to a free market with collective bargaining created serious problems, the solution of which became more largely the responsibility of labor and management. He pointed out that industry had sought removal of price controls while labor had pressed for removal of control of wages, and that both had insisted that decontrol would lead to increased production. He urged upon labor and management the working out of agreements for the adjustment of their differences without interruption of production.

The temporary suspension, radical modification, and final removal of controls brought about a rapid rise in prices with declines in real weekly earnings and increases in profits. This situation in turn gave rise to demands for further wage increases.

UNION ARGUMENTS FOR FURTHER WAGE INCREASES

Union officials emphasized the unfavorable reconversion trends of real wages, especially of weekly earnings. As for wage-rate changes, they pointed to the unequal extent of change, as for example, the fact that between V-J Day and May 1946, the rise in factory rates averaged only about 11.5 cents, with more than a fifth of factory workers and larger proportions of non-factory workers obtaining no increases. They stated that wholesale prices received by employers had risen far more, especially by the fall of 1946, than gross average hourly earnings, or the average cost of an hour of labor. Between July 1945 and October 1946, wholesale prices rose 26.6 per cent and continued upward; whereas, the gross average hourly earnings of factory workers rose only 9.4 per cent.

Another union argument for further wage advances was the considerable rise in forms of income other than wages. A statement published by the AFL asserted that "total profits after taxes reached a new peak in 1946" and that "American business firms in general were well able to pay higher wages." A much discussed report issued in December under the sponsorship of the CIO, asserted that the existing price and wage structure yields a corporate profit, before taxes, equal to the wartime peak and after taxes, almost 50 per cent above the wartime peak. Manufacturing corporations, it was asserted, had a fourth-quarter rate of return on net worth of 11.6 per cent and if the rate of return had been no greater than the 1936-39 average rate, their annual profit after taxes on the basis of fourth-quarter earnings would have been more than $2,000,000,000 in excess of the 1936-39 average.

It was argued that, in the absence of price controls, it would be difficult to reduce prices and that large increase in profits threatened the balance and stability of the nation's economy. The country was urged to learn the lesson of 1924 to 1929, when the failure "to raise wages substantially while productivity and profits were increasing resulted in a devastating depression" and that "substantial wage increases must now be made if we are to attain and maintain sufficient purchasing power to keep our economy moving full speed ahead."

Union pronouncements regarding wages commonly recognized increased productivity as a necessary basis for supplying goods to meet current demands, restraining inflation, and raising wages. An AFL statement in October expressed the view that, on the basis of past increases in production per man-hour and an extremely rapid increase expected in the immediate future, "unions can soon win wage increases without raising prices." The president of the CIO pointed out that advances in productivity were especially rapid after the First World War and that similar advances are under way and may be expected to continue.

The views of union officials, and particularly their arguments on the basis of the rise in profits, were widely criticized. It was pointed out in particular that aggregate profits do not reveal the profit status of particular industries and firms and that profits are to be viewed as highly variable, depending upon many factors other than those that affect wages. There was nevertheless an extensive recognition by employers themselves of the need to advance wages as rapidly as productivity and costs of production permit. Rising wages, under conditions of increasing efficiency and normal peacetime demands, were widely recognized as a necessary basis of maintaining high levels, not only of living standards but also of the demand for the products of industry on which production and employment depend.

RENEWAL OF WAGE DEMANDS

The unions generally held that, in view of the change in price policy and the rapid rise in prices, the efforts to stabilize wages should be discontinued. Before final decontrol measures had been adopted, extensive demands were made for wage increases.

An early attack on wage stabilization policy was made by the United Mine Workers. The union on Nov. 21 requested a reopening of the Krug-Lewis contract of May 29, on the ground that price policy had been changed and that the terms of the former agreement carried over and permitted reopening upon 10-days' notice and also permitted termination of the contract following 15 days of negotiations and a 5-day notice of termination. The demands included wage-rate increases and reductions of hours and also an increase in the amount paid by operators to the welfare fund. The Secretary of the Interior held that the terms of the contract with the Government provided for its remaining in full force and effect for the period of government operation except by joint consent. Negotiations failing, the president of the union gave formal notice on Nov. 15 of expiration of the contract on Nov. 20. On Nov. 18 the Government obtained from the Federal District Court of the District of Columbia a temporary order to restrain the union from terminating the contract, implying a work stoppage. The order was disregarded, and on Nov. 21, a virtually complete work stoppage occurred. On Dec. 4, the union was fined $3,500,000, and the president of the union, $10,000. The decision was appealed, but on Dec. 7, the workers were ordered by the president of the union to return to work until March 31, to free the Supreme Court "from public pressure" and to supply coal required by "public necessity."

Various unions carried on negotiations with employers for wage increases commonly described as the "second round." The unions in the meat packing industry reached agreements with major packing firms for extensive increases in wages and other changes. The agreement announced on Dec. 19 with Armour and Co., for example, included provisions for wage increases from 7.5 to 23 cents per hour, a narrowing of geographical differentials, sick leave, holiday and vacation arrangements, and study of proposals for a guaranteed annual wage. An agreement with the Sinclair Oil Corporation, announced Nov. 16, called for a wage increase equivalent to about 18 cents per hour based on a 40-hour work week and for further adjustments on a quarterly basis if the cost of living shows a movement of three points or more in either direction, rates not to fall below the level of Nov. 15, 1946.

In June, CIO unlicensed seamen obtained extensive increases in wages. Somewhat later, AFL seamen obtained somewhat larger increases, which, however, were disallowed by the NWSB. After an almost complete tieup of shipping beginning on Sept. 5, the additional increases were approved for government operated ships on Sept. 12 by the Director of Economic Stabilization as being consistent with the Government's policy of paying prevailing wages. The strike was continued, however, by

CIO unions, seeking similar increases. but on Sept. 20-21 an arbitration award was accepted. At the end of September the licensed personnel of shipping lines and the West Coast longshoremen went out on strike for renewal of agreements with wage increases. The strike was ended in East Coast and Gulf ports on Oct. 22 but not in West Coast ports until Nov. 17-18. The gains included an increase of 15 per cent in wages and concessions as to night work and overtime.

A considerable number of national unions either entered into negotiations late in the year or took steps to prepare for negotiations. Many of the unions indicated plans for presenting demands for various changes and adjustments in addition to specific wage increases. The CIO Convention, meeting in Atlantic City in November, declared that it is necessary "American industry in collective bargaining give substantial wage increases." Other resolutions supported a raising of the minimum wage under the Fair Labor Standards Act and called for a broad program to give workers "a rounded protection in their living standards through collective bargaining contracts providing for adequate pension plans, health insurance plans, group hospitalization programs, and a guaranteed annual wage." Discussion of guaranteed wage plans had been extensive throughout the year, and the Advisory Board of the OWMR (Office of War Mobilization and Reconversion), which had undertaken a study of the subject, presented in November an interim report which summarized much of the available data and made tentative recommendations. Another important union demand (discussed in connection with court decisions) also involved changes other than in wage rates, namely, the application of existing rates to travel time or its equivalent.

LABOR ORGANIZATIONS

The growth of union membership during the war was followed by declines in some industries because of reductions in employment. The United Automobile Workers, for example, attained a membership in excess of 1,000,000 by the middle of 1944; but the layoff of war workers, beginning before the end of the war, caused a considerable drop in membership. A steady increase was reported, however, for the year 1946.

Estimates of union membership toward the end of 1946, as derived from various union sources, indicate a total membership of between 14,500,000 and 15,000,000; the AFL affiliates, slightly more than 7,000.000; the CIO, about 6,000,000; and independent or unaffiliated unions, between 1,500,000 and 2,000,000. The main independent or unaffiliated unions are the International Association of Machinists, the railroad brotherhoods of train and engine service men, and the National Federation of Telephone Workers.

Changes in the affiliations of unions included the return after ten years of the United Mine Workers to the AFL. The Progressive Mine Workers of Illinois withdrew from the Federation. The International Association of Machinists, which was suspended by the AFL in December 1945, remained unaffiliated. The National Farm Labor Union became an affiliate of the AFL under a charter issued in August. The Amalgamated Lithographers joined the CIO in May after withdrawing in 1945 from the AFL. The Utility Workers Union of America, formed by a combination of the United Utility Union and the CIO Utility Workers Organizing Committee, became an affiliate of the CIO. The United Public Workers of America also became a CIO affiliate upon the amalgamation of the United Federal Workers and the State, County, and Municipal Workers. The National Federation of Rural Letter Carriers, AFL, merged with the Federation's National Association of Letter Carriers. The independent Airline Communication Employees Association merged with the American Communications Association, CIO. The AFL in August authorized the creation of the Maritime

Trades Department as a fifth department of the Federation. A Committee for Maritime Unity had previously been formed by CIO unions, but it encountered internal disagreements toward the end of the year.

The most extensive organizing activities of the year by both the AFL and the CIO were in the South. In May, the AFL revived its biennial Southern Conference, suspended during the war, and set up a policy board of 45 southern representatives of the Federation, with an executive committee to carry on the organizing movement. The AFL plan included an agricultural program to modify the South's dependence on cotton by promoting industrialization and agricultural diversification. A CIO Organizing Committee for the South set up a staff of 250 workers paid directly by the Committee, and about 30 field workers taking part in the drive were paid by the different unions of the CIO. Special effort was given to the organizing of workers in the textile, woodworking, food and tobacco, steel, oil, and chemical industries.

Various major unions continued to develop their research and public relations activities. The Executive Council of the AFL reported to the Convention that the most effective means of presenting the Federation's point of view to the public was its enlarged radio program. The CIO also reported an intensification of its radio activities and indicated an intention to extend its activities into the field of FM stations, several FM licenses having been obtained by CIO unions. The labor press continued to expand not only in the field of periodicals but also in connection with the extensive distribution of pamphlets. The CIO reported, for example, a total circulation of more than 325,000 for its pamphlet entitled "The Truth About CIO." The AFL reported the adoption of a retirement plan for its employees. The Federation also indicated significant progress in strengthening its ties with the Cooperative League of the United States.

In the political field, both the AFL and the CIO continued their policies of opposing the nomination and election of individuals who were viewed as unfavorable to labor and of supporting labor's friends. These activities were intensified by the widespread agitation for restrictive legislation, both state and national. Both of the major organizations also continued their efforts to obtain favorable court action against various state laws viewed as unconstitutional and as unduly restrictive of union activities.

FEDERAL LAWS AFFECTING LABOR

Numerous proposals were made for an extension of social security legislation to additional groups, with additional types of benefits, particularly in the field of medical and hospital facilities. The only Federal enactment in that field during the year was an amendment of the Railroad Retirement Act approved July 31. The new act gave railroad employees increased unemployment compensation benefits and sickness benefits for 26 weeks, and provided for increased retirement annuities, survivors benefits, and disability benefits.

A measure of outstanding importance was the Employment Act of 1946, approved Feb. 18, 1946. Although less definite in its terms than the original bill, the act declared it to be the policy and responsibility of the Federal Government to use all practicable means, in cooperation with state and local governments and with industry, agriculture, and labor, to create and maintain conditions such as are necessary to afford adequate employment opportunities and to promote maximum employment, production, and purchasing power. The measure created a three-member Economic Council to analyze and interpret economic developments, appraise public programs and activities, and develop and recommend to the President a national economic policy. Under the act the President will transmit to Congress an annual economic report, including a general economic analysis and a program for carrying out the policy of the act. A joint committee of Congress was authorized to analyze the economic report and coordinate Congressional activities affecting the carrying out of the law.

The Anti-racketeering Act of 1934 was amended on July 3 to extend its coverage to labor unions. The act made it a felony to interfere, by robbery or extortion or by threats or violence, with movement of goods in interstate commerce. Another restrictive labor law approved April 16 (later declared unconstitutional by a lower court) was the so-called Petrillo Practices Act to prohibit certain practices which the bill described as interfering with the rights of radio station licensees. Congress also included in various appropriation bills clauses forbidding strikes by Federal employees by providing that no wage or salary should be paid to any person who is a member of an organization of government employees that asserts the right to strike against the Government of the United States.

Increases in the wages and salaries of Federal employees, effective July 1, 1946, averaged about 13 per cent, the percentage advances being relatively large in the lower classifications. A separate act provided a flat increase of $400 per year for postal employees.

◆

PROPOSALS FOR FEDERAL REGULATIONS OF UNIONS

Recurring demands were made by various groups for legal restrictions on labor unions and particularly on the right to strike. These demands included modifications of the National Labor Relations Act to restrict unions and extend the rights of employers. The terms of that act were not amended, but a restriction of funds available to the National Labor Relations Board seriously affected the speed of its actions in holding elections for determining collective bargaining units during a period of organizing drives and increased demands for such elections.

Demands for restrictive legislation were brought to a head by the coal and railroad disputes. The Railway Labor Act of 1926 and later amendments had given protection to railroad workers as to collective bargaining rights but had provided a "cooling-off" period for action by the National Mediation Board and emergency boards preceding the exercise of the right to strike. The War Labor Disputes Act of 1943 had also provided during the war period for formal strike notices in war industries, strike votes by workers, and a 30-day "cooling-off" period. There had been no serious railroad strikes since the passage of the Railway Labor Act, but wartime procedures under the act had worked far from smoothly. The War Labor Disputes Act had failed to prevent serious reconversion work stoppages.

On May 29, immediately after the settlement of the railroad disputes and on the final day of the bituminous-coal strike, final action was taken in Congress on the Case Labor Disputes Bill. This bill imposed several important restrictions on union activities, but the bill failed of passage over the President's veto.

During the railroad strike, the President appeared before Congress on May 25 to request rigorous emergency legislation for dealing with situations such as resulted from the tie-up of the railroads. The bill he proposed, although passed by the House, failed of enactment in the Senate. The President, in his message on May 25, 1946, and also in his veto of the Case Labor Disputes Bill, requested that Congress formulate a long-range labor policy. He proposed in particular a joint Congressional committee to analyze the underlying causes of industrial strife and to formulate a policy designed to deal with causes and not merely to strike at "symptoms." These recommendations, however, were not adopted by Congress. Renewed demands for legislation followed the walkout of bituminous-coal miners on Nov. 20.

EXTENT OF STRIKE ACTIVITY

The year was marked by work stoppages more extensive than in any period since 1919, after the First World War. From December 1945 to November 1946, there were 4,470 walkouts, directly involving about 4,595,000 workers, and entailing, for these workers, about 115,193,000 man-days of idleness, or about 1.5 per cent of the estimated available working time of all workers. In 1919, the estimated number of workers directly involved in strikes was 4,160,000, hardly as large as the number in the year ended in November 1946, but total employment had greatly increased, and the number of workers involved in 1919 was about 21 per cent of potential employment—much larger than in 1946. Estimates of man-days idle in 1919 are not available.

The month of most serious work stoppages in 1946 was February with 21,500,000 man-days of idleness, representing 3.94 per cent of available working time. By the end of the year, strike activity had been almost completely halted.

CAUSES OF WORK STOPPAGES

There were numerous causes of the unusual wave of strikes in 1946. Earnings were reduced by loss of job opportunities in high-wage war industries and especially by loss of overtime and premium pay. Dissatisfaction with reduced earnings was accentuated by rising prices and by the continued favorable position of corporate profits and farm income, especially after the reduction of war taxes. The relaxation of wartime controls and release of wartime tensions intensified the problems of both unions and management. The shifting of millions of civilian war workers to new jobs, often in new areas, and the reabsorption of about 12,000,000 members of the armed forces gave rise to serious maladjustments in labor-management relations, which were aggravated by rising prices, housing problems, and shortages of various kinds.

The termination of various war agencies and the transition to almost complete dependence on voluntary collective bargaining placed a tremendous additional burden upon the Conciliation Service of the Department of Labor. The wartime principles of wage and price stabilization had served as the basis not only of official directives but also of agreements through collective bargaining. New standards and new procedures were required for the difficult period of transition.

PLANS FOR PEACEFUL ADJUSTMENT OF DISPUTES

Peaceful collective bargaining sufficed in the vast majority of disputes. The Director of the Conciliation Service reported that "even in this worst year, despite all the economic pains of reconversion, more than 45,000 agreements between employers and unions have been consummated peacefully without any interruption of work." The Director also announced a number of measures to facilitate and improve collective bargaining procedures.

On Dec. 16, 1946, the Director of the Conciliation Service made public a policy statement by the Labor-Management Advisory Committee. The statement reaffirmed support of the Government's policy of a full return to collective bargaining and voluntary mediation through the Conciliation Service. The committee recognized the peculiar difficulties of the transitional period and recommended four "mediation techniques" to supplement the daily mediation efforts of conciliators. One of these was a panel of men nationally known in labor relations, to be used as special conciliators in major disputes. Another was a system of tripartite panels of industry and labor representatives to serve with Federal conciliators. A third recommendation proposed that collective agreements include provisions for voluntary arbitration as the "terminal point" in grievance procedures and that the Conciliation Service encourage arbitration also in arriving at basic terms of contracts "after all mediation processes have been exhausted." The fourth recommendation was the final resort, in cases of national importance, to emergency boards of inquiry to be set up with the consent of the parties for the purpose of conducting hearings and publishing the findings.

Toward the end of 1946, the Conciliation Service took two additional steps to promote peaceful settlement of disputes. On Dec. 9, representatives of labor and management in the utility industries met in Washington to initiate plans for facilitating collective bargaining. On Dec. 23, a Labor-Management Assembly of the Philadelphia area was convened. The Assembly plan made use of earlier local experiences in Philadelphia, Toledo, and Louisville. It was described as an illustration of flexibility as the keynote of mediation work.

STATE LABOR LEGISLATION

In 1946, only 11 states held regular legislative sessions. In states that held special sessions, only in California was any important labor legislation enacted. The major subjects of action were industrial relations and workmen's compensation.

Industrial Relations.—New Jersey authorized the State Board of Mediation to settle controversies over the determining of collective bargaining units in public utilities. The law requires that in these employments union agreements must be for at least a year and must remain in force an additional year unless the changes desired are specified by the parties in writing. The law provides also for a public hearing panel in case of failure to reach an agreement regarding a new contract, and the Governor is authorized to take possession and operate any public utility to avoid work stoppages. In Louisiana and Virginia, laws were passed to restrict labor unions in regard to picketing and to violation of collective bargaining agreements. A joint resolution in Virginia declared it to be contrary to public policy for any state, county, or municipal official to recognize and negotiate with a union of public employees. Massachusetts adopted a constitutional amendment requiring public reporting of union finances, and amendments in Arizona, Nebraska, and South Dakota imposed prohibitions on the closed shop. Various unions indicated their intention to challenge some of the measures in the courts.

Workmen's Compensation.—Several states amended their workmen's compensation laws. The Kentucky and Virginia acts were changed from an elective to a compulsory basis for employees in certain hazardous employments in Kentucky and for all employers with seven or more employees in Virginia. The coverage of the New York law was extended to include certain classes of domestic workers. The Georgia law was amended to cover certain occupational diseases. Rhode Island established a commission to make codes for the prevention of accidents and occupational diseases consistent with specified nationally accepted safety codes. The level of benefits was raised in California, Kentucky, Massachusetts, New York, and Virginia. In general, however, workmen's compensation benefits have failed to rise in keeping with advances in wages and prices. In California, a disability insurance measure was enacted.

Child Labor.—In Georgia, a new child labor act raised the minimum age for work from 14 to 16 years in various types of employment. Massachusetts for the first time regulated the hours of work of minors on farms. That state followed the earlier example of Connecticut, New York, and Rhode Island in extending the minimum wage law to men. Rhode Island in 1946, and Massachusetts in 1945, prohibited wage differentials based on sex for comparable work.

Migratory Farm Workers.—New York enacted two laws designed to safeguard the interests of migratory farm workers. One measure requires anyone who employs, recruits, transports, or brings into the state as many as 10 out-of-state workers in farm or food-processing employments to register with the state's industrial commissioner and to submit information regarding the housing facilities, working conditions, and wages of the workers. The other law gives to district health officers the power to determine whether or not labor camps in his jurisdiction conform to the public health law or sanitary code and to take action against violators

The problem of migratory labor was one of the subjects of concern to the Thirteenth National Conference on Labor Legislation, held in Washington Dec. 2-4, 1946. The conference was attended by 150 representatives appointed by governors of 43 states. One of the resolutions adopted favored the extension and improvement of social legislation and called for adequate support of state and Federal labor departments. Collaboration of state and Federal authorities was urged for the purpose of raising labor standards throughout the country to the levels of conventions and recommendations adopted by the International Labor Organization. Compulsory arbitration of labor-management disputes was opposed, as was any legislation that would weaken unions or deprive workers of the right to organize and engage in concerted activities.

COURT DECISIONS AFFECTING LABOR

State courts and lower Federal courts rendered a large number of decisions of special importance in the field of recent laws for regulating or restricting the activities of unions. These and other lower-court decisions, however, when of outstanding significance to labor, were for the most part appealed to higher courts. The year was marked also by numerous decisions and orders by administrative agencies such as the National Wage Stabilization Board and the Wage and Hour and Public Contracts Division of the Department of Labor and the National Labor Relations Board. Few of these, however, had to do with important changes in policy.

TRAVEL-TIME PAY

Decisions by the U. S. Supreme Court of unusual interest defined as working time the travel time or other non-productive time spent by workers after they report for work and after they leave their places of work. In the Tennessee Coal, Iron and Railroad Company case, the Supreme Court had earlier ruled in favor of pay for travel time in iron mines under the Fair Labor Standards Act. In the Jewell Ridge Coal Company case, the court had applied the same doctrine to bituminous-coal mining. In June 1946, the court extended the principle of travel-time pay to industry other than underground mining by its decision in the case of *Anderson* v. *the Mt. Clemens Pottery Company.*

The work week under the Fair Labor Standards Act, the court held, "includes all time during which an employee is necessarily required to be on the employer's premises, on duty, or at a prescribed workplace." Hours worked include not only time spent in walking on the premises to the place of work but also preliminary time required for such activities as changing to work clothes and preparation of tools, machines, or materials. The court noted also the similar activities required in reverse after the day's work. It was stated, however, that when "only a few seconds or minutes" are involved, "such trifles may be disregarded."

OVERTIME PAY AND DAMAGES

Numerous suits brought as a result of the Mt. Clemens Pottery case involved retroactive overtime pay and even damages. Toward the end of the year, employers took steps to ask for Congressional action to limit or define their liability under the new interpretation of the Fair Labor Standards Act.

Another Supreme Court decision involving the Fair Labor Standards Act nullified written releases granted by maintenance workers to their employers from damages in return for payment by the employer of overtime under the act. The employer had claimed exemption from the act on the ground that the tenants of the building did not directly ship their products in interstate commerce. The employees, in return for premium pay for overtime, had waived their claims for damages. One of the employees, however, sued for damages. The court on April 29, in the case of *D. A. Schulte, Inc.,* v. *Gangi,* ruled that the waiver of damages by the employees violated the law because Congress intended the right to damages not only as a direct protection of the employee but also as an aid to the enforcement of the law.

"KICKBACKS"

The U. S. Supreme Court on March 25, in the case of the *United States* v. *Carbone, et al.,* ruled that the Federal "Kickback" Act does not apply to union officials who require non-union workers on government projects to pay union initiation fees. It was stated that Congress did not intend that the act should affect legitimate union activities, such as requiring non-union workers to pay fees under closed-shop agreements, or to make the act applicable even to unlawful actions of union officials not connected in any way with "kickbacks." The act was intended to prevent employers from evading wage scales fixed by the Government on its projects by requiring employees to give back part of their lawfully earned wages.

INTERPRETATION OF SELECTIVE TRAINING AND SERVICE ACT

The interpretation of the Selective Training and Service Act by the Selective Service Director was reversed by the Supreme Court on May 27 in the case of *Fishgold* v. *Sullivan Drydock and Repair Corporation.* The decision held that the act did not grant to veterans rights of "superseniority" but was intended only to maintain their rights "within the framework of the seniority system plus a guaranty against demotion or termination of the employment relationship without cause for a year."

ADMINISTRATIVE CHANGES AFFECTING LABOR

The end of the war affected the Department of Labor in a number of ways. The National War Labor Board and the Retraining and Reemployment Administration were transferred to the Department. The termination of the War Manpower Commission was followed by the transfer of the U. S. Employment Service and the Apprentice Training Service back to the Department, after the wartime incorporation of these agencies in the WMC. In July, 1946, the Children's Bureau, with the exception of its Industrial Division, was transferred to the Federal Security Agency. The Industrial Division was retained in the Department as the Child Labor and Youth Employment Branch of the Division of Labor Standards. The National War Labor Board was terminated, but the modified program of controls was administered in the Department by the National Wage Stabilization Board. An executive order of Dec. 12 terminated the NWSB as of Feb. 24, 1947, but provided for continuance of certain functions in the Departments of Labor and the Treasury.

Proposals were made in Congress soon after V-J Day for the transfer of the employment offices of the U. S. Employment Service to the states. The urgency and national scope of reconversion problems growing out of the large-scale shift of war workers to new employments and the placement of the millions of veterans rapidly being demobilized caused a delay in the return of the offices to the states. Congressional action at length required, however, that local operations be restored to state control. The Director of the U. S. Employment Service announced that by Nov. 17 all state programs for operating employment offices had been approved, although in certain cases with reservations, and the transfer occurred on Nov. 18.

A noteworthy post-war development in Department of Labor functions was the reorganization and expansion of the Conciliation Service. During the war, public functions bearing on labor relations had been widely scattered. These functions, other than those of the National Labor Relations Board and the National Mediation Board, were brought together in the Conciliation Service. Labor-management advisory committees were organized to aid the Conciliation Service in its general functions and its technical and analytical services. Similar committees were established on a regional basis, and both the central staff and the field offices were reorganized.

During the depression of the thirties, apprentice training had seriously declined, and the war checked the revival of such training. The Apprentice Training Service of the Department was considerably expanded for the purpose of continuing in modified form some of the wartime training activities, restoring pre-war work in this field, and meeting the vastly expanded demand for skilled workers, especially in the construction field.

A new Commissioner of Labor Statistics was appointed. Some of the activities in the field of research and statistics, which had been transferred to war agencies, were brought together in the Bureau of Labor Statistics.

The Division of Labor Standards established a Labor Education Service. A 10-member labor advisory committee from the AFL and the CIO was appointed. The program includes personal consultative services, on request, to any union, university, labor school, or civic group to aid in the development of a labor education program; a national clearing-house service for information on labor education; and the preparation and distribution of lesson plans and pamphlets.

The appointment of an under secretary and three instead of two assistant secretaries was authorized by Congress. On Dec. 6, 1946, the Secretary of Labor issued an order reorganizing the staff of the department, with a specific allocation of duties and functions, and the Secretary's Staff Committee was formed to tie together the work of the various agencies and to make their services more readily available to labor, management, and the public.

INTERNATIONAL LABOR

Disagreement between the AFL and the CIO continued in regard to representation in the International Labor Organization. The CIO claimed the right of representation at the September convention of the ILO in Montreal, and proposed alternate representation of the AFL and CIO. The decision of the President, as in previous years, was in favor of the AFL, which refused to consider alternate representation; and the president of the CIO declared that, in the judgment of its officials, this action substantially destroyed "whatever remaining usefulness to labor and to the masses the ILO may have had."

A recent development in the work of the ILO took the form of industry committees. Important fields of activity of these committees included coal, steel, shipping, inland transport, and petroleum. Another important ILO change was the agreement between that agency and the Economic and Social Council of the United Nations for coordinating their work and defining their respective fields of activity.

The CIO, as an affiliate of the World Federation of Trade Unions, formed in 1945, took a prominent part in the activities of that organization. The AFL, after the liquidation of the International Federation of Trade Unions, with which it had been affiliated, refused to participate in the work of the WFTU on the ground that the Russian unions and some other affiliates are not "free" unions. The AFL expressed a keen sense of responsibility for the development of "free" unionism throughout the world and continued to maintain connections abroad.

The CIO, through the WFTU, continued its interest in the work of the

Economic and Social Council. The AFL obtained advisory status in relation to the Council equal to that of the WFTU.

The AFL and the CIO, although in disagreement over such questions as ILO representation and affiliation with the WFTU, had common interests in the basic problems of international relations as affecting labor. These common interests were reflected in the initial meetings of the Union Advisory Committee on International Affairs, formed during the year to cooperate with the Department of Labor in the discharge of its responsibilities in the international field.

EMPLOYMENT AND UNEMPLOYMENT STATISTICS

By Irma Rittenhouse
Division of Placement and Unemployment Insurance, New York State

GENERAL

Employment in 1946 was higher than was foreseen by all except the most optimistic. Despite serious labor disputes in basic industries, widespread business hesitation, and continued material shortages, the combined index of industrial production was reported at 185 (1935-39 = 100) in October 1946, as compared to 164 a year earlier. The index of production of durable goods showed a particularly marked increase, from 187 in October 1945 to 215 in October 1946. Non-durable goods production experienced a slightly more moderate gain over the year (from 158 to 174) and in October 1946 was considerably lower than the durable goods index in relation to 1935-39.

After the first check when war production, representing two-thirds of our industrial output, ceased, employment gradually was resumed at a rate about even with the growth of the labor force. The absorption into employment of most of 7,000,000 ex-servicemen and women within a year after V-J Day was an outstanding phenomenon. The year 1946 was characterized by far more concern over labor income in the face of rapidly rising living costs than by concern over employment.

By November 1946, the total civilian labor force was 58,970,000, of whom about 57,000,000 had jobs of some kind. Non-agricultural employment (49,000,000) was at an all-time high and agricultural employment amounted to 7,900,000. (See Table X for details of labor force figures.)

TABLE I

INDEXES OF EMPLOYMENT OF PRODUCTION WORKERS IN MANUFACTURING

(1939 = 100)

	All Manufacturing	Durable Goods Group	Non-durable Goods Group
1943 monthly average....	154.0	193.8	122.7
1945 monthly average....	148.2	186.9	117.8
1946			
January.....	130.2	144.1	119.2
February....	121.9	122.6	121.4
March.......	129.9	138.9	123.1
April........	136.0	151.8	123.5
May........	137.0	154.8	123.0
June........	139.3	158.0	124.4
July.........	140.8	161.0	124.9
August......	145.0	166.2	128.4
September...	146.7	168.6	129.4
October......	146.7	169.4	128.9

As early as January 1946, there were contra-seasonal employment increases in private construction, manufacturing, and mining, owing to the released demand for peacetime goods of all kinds. In trade, the usual seasonal decline occurred. In February, there were unusual further gains in construction and trade employment, and some gains in light manufacturing. Strikes and material shortages caused heavy layoffs in heavy manufacturing, but there were employment recoveries in March when some of the important disputes were settled. By May, non-agricultural employment was at V-E Day levels. By mid-summer, there was a further general increase in employment, the construction industry especially taking on labor at a rapid pace. In August, the first increase in the employment of women since hostilities ended occurred. Employment gains continued into the fall, though by November construction employment had fallen off and some other customary seasonal recessions occurred (Table I).

All regions of the country, though not all individual states, shared in the employment gains in the year after V-J Day. Table II shows the regional changes in non-agricultural employment as estimated by the U. S. Bureau of Labor Statistics.

TABLE II

REGIONAL CHANGES IN NON-AGRICULTURAL EMPLOYMENT, AUGUST 1945—AUGUST 1946

(in thousands)

	August 1946	August 1945
New England	2,945	2,839
Middle Atlantic	8,917	8,775
East North Central	8,591	8,074
West North Central	2,825	2,737
South Atlantic	4,441	4,413
East South Central	1,729	1,667
West South Central	2,422	2,435
Mountain	956	908
Pacific	3,423	3,377

CHANGES IN THE LABOR FORCE

In the year ended August 1946, the civilian labor force had increased by 5,500,000 persons, according to Census estimates. The labor force was increased by 10,500,000 ex-servicemen. On the other hand, within the six months after V-J Day, about 2,000,000 women ceased to be employed. Of the 8,000,000 "extra" workers—women, youngsters and others not usually employed—who had entered the labor force during the war, about 5,600,000 had withdrawn between April 1945 and August 1946.

Because of the high post-war marriage and birth rates, young women aged 20 to 34 left the labor force in large numbers, and, barring a depression that forces them into the labor market, women of this age group are not expected to seek employment at as high a rate as in pre-war years. Women of 35 and over, on the other hand, still exceeded "normal" in the labor force a year after V-J Day, by at least 750,000. This group is not withdrawn from the labor force to any extent by marriage and childbearing, and their status and opportunities in the labor market are still uncertain.

School-age children employed during the war withdrew from the labor market to the extent of 2,600,000 in the year ended August 1946. Although further declines in the number of teen-agers seeking or holding jobs were expected in the fall of 1946, this part of the "extra" labor force was 1,400,000 in August 1946 and may not be much reduced so long as favorable employment opportunities, especially in the summer, persist. Young men in their early twenties, on the other hand, are in the civilian labor force in less than normal numbers, owing to military service and to subsidies for college education under the Servicemen's Readjustment Act of 1944.

Table III shows the changes in the numbers of men and women in non-agricultural employment, as estimated by the U. S. Bureau of the Census, in November 1945 and November 1946.

TABLE III

MEN AND WOMEN IN NON-AGRICULTURAL EMPLOYMENT

(in thousands)

	Week Ended	
	November 10, 1945	November 9, 1946
Total	43,070	49,140
Men	27,510	34,050
Women	15,560	15,090

EMPLOYMENT IN MANUFACTURING

Shipments of durable goods by manufacturers began a precipitous decline in May 1945, levelled off in October-December 1945, and declined sharply in January-February 1946. At the low point in February 1946, they were only about 50 per cent above the 1939 average. Strikes and threats of strikes in early 1946 were the main factors in the decline of shipments. In March, however, a steady upward movement began, and by September the index was on the way up above the October-December 1945 level. Shipments of non-durable goods remained about at 1945 levels during the first three quarters of 1946 but turned upward somewhat in September. In view of peacetime consumer demands, this was a disappointing performance. It was attributable almost entirely to material shortages and to price uncertainties.

These movements were approximately reflected in manufacturing employment (Table I). The U. S. Bureau of Labor Statistics employment reports show a sharp decline in the durable goods index from 186.9 monthly average in 1945 to 122.6 in February 1945, but a steady increase from February onward to 169.4 in October. The index of employment in the manufacture of non-durable goods increased very slowly throughout 1946, with a level of 128.9 reached in October (1939 = 100). Table IV shows employment changes in leading industries of both the durable and non-durable goods groups in October 1945 and October 1946.

TABLE IV

INDEXES OF MANUFACTURING EMPLOYMENT, BY INDUSTRY, OCTOBER 1946 AND 1945

(1939 = 100)

	1946	1945
Total	146.7	127.6
Durable goods	169.4	142.6
Iron and steel and products	145.5	125.2
Elec. machinery	215.9	180.1
Other machinery	206.5	172.1
Transportation equipment, except automobiles	278.7	420.4
Lumber and timber basic products	150.7	113.3
Non-durable goods	128.9	115.7
Textiles and fibre products	107.0	92.4
Apparel and other finished textile products	137.4	117.5
Food	125.7	130.6
Chemicals and allied products	170.5	168.5
Tobacco	95.8	92.2
Printing, publishing and allied industries	120.1	102.5

MINING EMPLOYMENT

Employment in both coal and metal mining was below pre-war levels throughout 1946 (Table V). The bituminous coal strike in April brought production practically to a stop in that branch of the mining industry during the month, and employment went to 20 per cent of the 1939 level. Coal mines operated short-handed during the entire war period, and efforts to bring miners out of military service by arrangement with the War Department did not make up for the labor deficiency. With the end of the war, the threat of the persistent under-employment of normal peacetime years was revived. This long-run problem, combined with a great increase in productivity per man-hour in the last ten years, was the basic factor in the early spring and late fall strikes in the industry for higher wages and various income-protection plans. All branches of mining are heavily dependent, like construction, on the general level of business activity. In addition, coal is the victim of severe competition from other sources of heat and power. The sites of employment in mining are relatively isolated, and there is little opportunity for occupational shifts on the part of mine workers. This combination of circumstances makes the post-war situation in mining one of the critical employment problems of the country. According to the *Monthly Labor Review* (August 1946), peak production in bituminous coal mining was reached in 1943-44; yet the average number of wage earners each year during the war period was as follows:

Year	Average Number of Wage Earners
1940	415,000
1941	407,000
1942	435,000
1943	386,000
1944	354,000
1945	322,000

In pre-war years, the bituminous coal miners could produce all that the country needed, according to the Bureau of Labor Statistics, in 200 working days a year.

TABLE V

INDEX OF EMPLOYMENT IN MINING

(1939 = 100)

	Bituminous	Anthracite	Metals
January	91.2	79.3	76.3
February	92.0	81.1	72.0
March	92.2	81.7	63.1
April	20.1	81.4	58.8
May	69.8	81.0	72.3
June	89.5	79.8	72.2
July	89.3	82.2	74.8
August	90.8	82.0	82.5
September	90.5	82.2	83.5
October	90.1	83.2	83.9

EMPLOYMENT IN CONSTRUCTION

Employment in construction in 1946 responded to the pent-up needs accumulated during the war period for private industrial and commercial building in particular. United States Bureau of Labor Statistics estimates show construction employment 500,000 higher in January 1946 than in January 1945. In March, the total estimated employment was 1,503,300, and by September it had reached 2,302,000, or more than double the employment of a year earlier (Table VI). Federal construction activity played a small part only in this employment change, owing to cessation of hostilities. Private construction expenditures from January to October 1946 were $8,000,000,000 as compared with $2,800,000,000 in the first ten months of 1945, whereas public expenditures (all levels of government) actually decreased from $1,800,000,000 to $1,700,000,000 in the same two periods. Shortages of many types of skilled construction workers were widespread during the year. This industry is probably the most sensitive barometer of general business activity, and is almost entirely dependent on it. Employment was, therefore, expected to increase sharply as soon as war restrictions on construction and repairs were removed, but employment irregularity in the industry springs from variations in demand to a much greater extent than from weather conditions.

TABLE VI

ESTIMATED CONSTRUCTION EMPLOYMENT, SEPTEMBER 1946

(in thousands)

All types	2,302
New	2,002
Private	1,549
Residential non-farm	621
Non-residential bldg.	659
Farm	106
Public utilities	163
Public	453
Federal	237
Non-Federal	216
Minor bldg. repairs	300

EMPLOYMENT IN UTILITIES AND TRADE

As is customary among the utilities, employment remained relatively stable throughout 1946, with the telephone industry showing the highest gain over 1939 employment (Table VII). Employment in trade, although above the pre-war level in August 1946, the highest on record, did not increase at the same pace as employment in manufacturing despite the record year in sales. Employment in trade is normally less responsive to both ups and downs of business than employment in manufacturing, construction, or mining.

EMPLOYMENT ON RAILROADS

The service record of railroads in wartime was exceptional in view of restricted labor supply compared to manufacturing industries. According to the U. S. Department of Labor, the number of passenger-miles and tons of freight doubled in 1939-44,

TABLE VII

INDEXES OF EMPLOYMENT IN UTILITIES AND TRADE

(1939 = 100)

	January	April	July	September
Public utilities				
Electric light and power	92.9	97.7	101.2	101.9
Street railways and busses	123.7	127.0	128.9	129.9
Telegraph	n.a.	119.8	112.4	112.0
Telephone	146.3	163.5	177.7	181.0
Trade				
Wholesale	106.5	106.7	107.5	109.4
Retail	104.1	109.0	106.3	109.8

but the average number of employees increased only 43 per cent:

Year	Average Number of Employees
1939	988,000
1940	1,027,000
1941	1,140,000
1942	1,271,000
1943	1,355,000
1944	1,414,000
1945	1,420,000

It will be noted that the peak in railroad employment was reached in 1945, not in 1943, as in the case of manufacturing.

During 1946, employment on Class I railroads declined somewhat, although in no month was it less than 32 per cent above the 1939 level (Table VIII). The railroads had made considerable use of women workers (though in a limited number of occupations) during the war, and substantial layoffs of women in favor of veterans occurred in 1946. In January 1943, 63,187 women were employed, and a peak was reached in April 1945 with 115,876 women. During the next nine months, the over-all decrease in employment was 2 per cent, but of women workers, 15 per cent. Yet the year 1946 opened with 98,184 women employed, or 55 per cent more than in 1943. Apart from the fluctuations in employment of women, whose permanent attachment to this industry is doubtful, decreases in 1946 were largely in maintenance-of-way and train-and-engine workers, rather than in railroad clerical jobs. Although total layoffs of the wartime labor force in this industry during 1946 were relatively slight, the unemployment insurance records of the Railroad Retirement Board show a slight but persistent increase of claims into the fall of the year, unlike the experience with claims from workers in all other insured industries and among ex-servicemen.

TABLE VIII

INDEX OF EMPLOYMENT ON CLASS I STEAM RAILROADS

(1939 = 100)

	1946	1945
January	141.0	141.1
February	138.4	143.1
March	138.4	144.1
April	136.3	143.8
May	132.4	144.4
June	134.6	147.2
July	136.6	146.9
August	138.8	146.7
September	137.9	143.1
October	139.3	141.4

GOVERNMENT EMPLOYMENT

From the close of hostilities to September 1946, the net reduction in Federal employment was 1,300,000 from a high point of 3,727,474 in September 1945. Not all branches of the Federal Government showed declines, of course; in contrast to heavy reductions in civilian personnel of the Army and Navy and in war agencies, the agencies with a large post-war task, the Veterans' Administration, and the War Assets Corporation, for example, actually added substantial numbers of employees.

The most severe cuts in Federal employment in the first year after the war occurred outside Washington, D. C., where, however, less than 10 per cent of all Federal workers were employed in September 1946. Owing to the sharp declines in Federal employment, estimated total employment by Federal, state, and local governments (excluding Federal force-account construction workers) showed a net decrease in the year after V-J Day, from 5,933,000 in September 1945 to 5,448,000 in September 1946.

AGRICULTURAL EMPLOYMENT

In 1946, according to the U. S. Department of Agriculture figures, the labor supply on American farms was generally adequate. In January, employment was at the lowest point in the 21 years of record, but from that month onward was usually well above employment of a year earlier while the war was still being waged. Work days were shorter in 1946, reflecting the more ample labor supply. By mid-summer, employment was consistently greater than a year earlier and in August reached the highest point since August 1942. By that month also, the return of family workers from military service and war plants was substantial enough to be statistically notable. By November-December, total employment, though down seasonally, was still higher than in the previous year. Good weather conditions helped sustain the high employment levels in agriculture throughout the year.

During 1946 it is estimated that 1,000,000 ex-servicemen found employment on farms. This compensated for the absence of prisoners of war and the lessened number of foreign workers used for peak harvesting periods during the war. During January 1946, 48,000 prisoners of war were still engaged on American farms, but no further reports of their use were made in the analyses of labor supply. Foreign workers (Mexicans, Jamaicans, Bahamians, British Hondurans, and Newfoundlanders) were used in January to the number of 33,000, as compared to the August-September 1945 peak of 88,000. By July, 58,000 were employed, and on Dec. 1, 1946 the number had declined again to 35,298.

Fluctuations in the use of hired *versus* family labor on farms reflect both general business conditions and the degree of "industrialization" of agriculture. Hired labor falls relative to family labor when other job opportunities exist. Yet high wage rates paid by farmers in 1946 attracted a larger number of hired workers than in the last war year. Large-scale farming is the leading explanation of concentrations of hired labor, and thus there has been a continuous upward trend in its use during the past ten years on the Pacific Coast. A notable development during the year was the introduction of the cotton-picking machine in the South, which is expected greatly to change the pattern of farm employment in that area and result in a flow of labor to industrial regions. The Department of Agriculture (Bulletin *Farm Labor*) has compiled the indexes in Table IX, showing the levels of hired and family labor in different areas of the country as compared with the 1910-1914 period.

TABLE IX

TYPE OF LABOR BY TYPE OF FARMING AREA

(1910–14 = 100)

	1946	
	Family	Hired
Corn area	87	47
Eastern dairy	78	72
Western dairy	94	60
Middle eastern	86	57
Eastern cotton	67	78
Delta cotton	89	77
Western cotton	82	93
Small grain	97	63
Range	124	91
Northwestern	129	131

UNEMPLOYMENT

Unemployment, as measured either by the United States Census surveys or by unemployment compensation claims, began to shrink in volume in the early spring of 1946, after the first impact of post-war layoffs and demobilization. Shortages of basic materials needed for peacetime production, hoarding of products, and slow-downs by business management in a struggle against price control and wartime taxes, as well as major labor disputes, were characteristic of most of the year and caused unemployment and under-employment to be greater than the post-war civilian demand for goods would have indicated. By the end of the year, however, the main economic causes of unemployment were the customary. seasonal influences, continued shortages of material, and business uncertainty as to the direction of price movements after the removal of government controls.

The composition of the unemployed population had changed radically from a year before. In place of recently discharged servicemen and ex-war workers of the younger and middle-age groups, with a disproportionate number of women workers, the unemployed in the latter part of 1946 consisted to a considerable extent of workers of both sexes over 45 years of age, already feeling the effect of peacetime selectivity in hiring, and new entrants to the labor market, both veterans and non-veterans, who lacked work experience. Reports from New York, for example, showed that unemployment benefit claimants of both sexes, who were exhausting their benefit payments in December 1946 (*i.e.*, had remained without work for six months), were largely over 45 years of age or had physical defects or personality characteristics that made them hard to place in the peacetime employment market. This problem of "economic old age" is the more serious because of the clear-cut tendency for the labor force as a whole to contain a growing proportion of older workers. In December 1945, 38 per cent of the labor force was over 45. Of women in the labor force, 26.4 per cent were 45 or over.

Apart from these workers who were having long-term difficulties in finding employment, unemployment during the year was largely of the short-term kind normally experienced in peacetime. One further factor affecting labor mobility and consequently the matching of the worker to the job, however, was the general housing shortage. This inhibited to some extent the movement of unemployed workers to places where job openings existed.

The U. S. Bureau of the Census, Commerce Department, provides monthly estimates of the labor force based on a cross-section survey. The concepts of employment and unemployment used are peculiar, and the data must be interpreted with caution. Persons are counted as employed if they "have a job" even though they are laid off during the Census week for less than 30 days or are working short time. Persons engaged in incidental unpaid family work, on the other hand, are counted as "not in the labor force." The data thus actually represent a measure of the amount of part-time and full-time work being provided in general ("employment") in contrast to the number of job-seeking workers who are surplus because they have no employment attachment ("unemployed"). The data are also subject to some bias because of possible subjectivity of replies; the information is gathered by means of inquiries addressed to a sample of housewives. Nevertheless, these monthly estimates represent a substantial step forward

TABLE X

ESTIMATED LABOR FORCE AFTER V-J DAY

(in thousands)

	November 3–9, 1946	November 4–10, 1945
Total, including armed forces	60,980	62,410
Civilian labor force	58,970	53,190
Employed	57,040	51,450
At work, full or part time	55,540	49,740
With a job but not at work	1,500	1,710
Unemployed	1,930	1,740
Not in labor force	45,860	43,390

in analyzing labor force patterns. Table X compares the labor force two months and 14 months after V-J Day.

These estimates show 1,930,000 without a job in the first week of November, but 11,150,000 either totally unemployed or employed for less than 35 hours in that week. A certain proportion of this larger group, not specified by the Census surveys, were of course voluntary part-time workers.

INSURED UNEMPLOYMENT AND INSURANCE CLAIMS

The unemployment insurance programs (veterans, railroad workers, and workers insured under state laws) cover both partial and total unemployment of an involuntary character. Except for railroad workers (covered under a single national system), insured unemployment showed a steady and sharp decline from the post-war peak reached in February-March 1946. By the end of the year (Nov. 16) a total of only 1,872,000 claims was reported nationally from all three groups. The peak had been reached in the week ended March 2 with 3,662,000 claims.

Insurance claims include not only workers on involuntary short time but also workers who "have a job" but are temporarily laid off. They exclude, on the other hand, farm workers, government employees, employees of charitable and educational institutions and, in many states, employees of small firms. The differences in definition make comparability with the Census data unfeasible. The insurance claims data reflect involuntary unemployment more accurately than the Census figures and are most useful as a direct measure of unemployment of labor.

UNEMPLOYMENT IN THE STATES

Marked changes in the post-war impact of unemployment occurred in the various states, reflecting in part the various statutory limitations on benefits which affected war workers in particular, but also measuring the employment recovery. Thus, in the third week after V-J Day, Michigan and Rhode Island had the highest ratios of continued claims (*i.e.*, of more than a week or two in duration) to 1945 employment, with 14 and 9.5, respectively. By January 1946, the West Coast States, the Middle West, New York, New Jersey, and Connecticut were experiencing relatively heavy levels of unemployment. By November 1946, however, the highest rate of unemployment (as compared with 1945 employment) was reported from Washington, with only 6.4 per 100. The only other states with a ratio above 4 per 100 were California, Oklahoma, Missouri, New York, and New Jersey. The national average rate was only 3 per 100.

VETERAN READJUSTMENT ALLOWANCES

Much attention was directed during the year to readjustment allowances received by ex-servicemen, and severe criticisms of the "52-20 Clubs" (52 weeks of benefit at $20 per week) appeared in the press. Official reports indicate that three outstanding causes of criticism are: (1) delays in adjustments to peacetime working conditions by young veterans; (2) local laxity in administering the statute as a true unemployment insurance measure and viewing it as a "bonus" measure; (3) resistance to hiring ex-servicemen because of their lack of recent industrial or business experience.

The curve of claims by ex-servicemen, however, shows a steady and precipitous decline from March 1946, when the impact of demobilization was at its height, to November 1946, a decline more sharp than that of non-veteran claims. The largest amount of registered unemployment among ex-servicemen was 1,784,000 in the week ended March 23, 1946. From November 1945 to March 1946, veterans accounted for about three-quarters of the unemployed. By Nov. 16, 1946, the number of unemployed ex-servicemen had dropped to 931,000, a low fraction of 13,000,000 demobilized men and women.

XVI. LABOR AND LABOR LEGISLATION

CHILD LABOR

By Louise D. Stetter
National Child Labor Committee

CHILD LABOR FACTS AND FIGURES

The sharp decline in the employment of school-age children, which was expected to follow shortly after the end of the war, did not materialize. The Bureau of the Census estimates that by April 1945 there were 3,500,000 young people between 14 and 18 years of age at work full or part time, and that this number had declined only to 2,250,000 by April 1946. Therefore, almost one year after V-E Day there were still over twice as many minors 14 through 17 years of age at work as there were in 1940 and, although there is no official estimate of the thousands under 14 years of age known to have been a part of the labor force during the war years, they must be taken into account when considering the child labor picture.

The reduction in the number of working minors estimated by the Census Bureau is considerably less than would be expected from the decreases reported in the issuance of work permits. These reports, though incomplete and scattered, provide the most reliable evidence of the extent to which young people are going to work for the first time in the industries for which permits are most frequently required, namely, the manufacturing and distributing industries. Available figures from cities in various sections of the country show substantial decreases in the number of permits issued in 1945 or 1946 as compared with similar figures for the previous year.

In Rhode Island the number of permits issued to children of 14 and 15 years of age in 1945 was 23 per cent less than those issued in 1944. In North Carolina, from a peak of 11,000 permits issued to minors between 12 and 18 years of age in June 1945, the total had dropped to 2,920 in December and to 1,628 in February 1946. There were 14,118 fewer boys and girls 14 to 18 years of age working full or part time in Philadelphia in January 1946, than in January 1945, when the number was 29,311. In spite of this drop there were still six times as many young people employed in Philadelphia in the early part of 1946 as in 1940. In Salt Lake City 9,613 employment certificates were issued during the year 1944-45 and only 6,754 in 1945-46. Certificates totaling 30,488 were issued to minors between 14 and 18 years of age in Illinois in 1945, a decrease of 3,800 from the 1944 total. Employment certificates issued to minors 14 to 18 years of age in New York State totaled 128,193 for the first four months of 1945, and dropped to 80,065 for the same period of 1946.

Since employment certificates are seldom required for domestic service or agricultural work and are often not required for the service trades which employ many children, the permit figures do not reflect the extent of employment of young people in these two occupation groups, nor do they reflect the numbers of minors employed in part-time and summer vacation work for which permit requirements are often ignored or do not exist. From these facts it is logical to conclude that the first reduction in child employment after V-E and V-J Days was considerably greater for full-time work in industrial establishments than for work in service trades and agriculture.

SCHOOL ATTENDANCE AND YOUTH EMPLOYMENT

While youth employment was increasing during the war years (1940-45), high school enrollment decreased by 17 per cent. Some of this decrease was caused by the entrance of young people into the armed forces and some by the decrease in the general population group, but the chief contributing factor was the entrance of young people of high school age into the labor force. The drop in enrollment was checked in the fall of 1945 but so far there is no evidence of an increase in high school enrollment corresponding to the decrease in the issuance of work permits. This is another indication that large numbers of young people are still at work and that few who left during the war years have returned to school. Not all of them still have jobs for already, in some places, unemployment of young people has become a problem. As adult labor becomes more plentiful. employers' requirements in terms of education and experience become more stringent, and young workers find it increasingly difficult to locate employment except in the least desirable and poorest paid jobs.

Recognizing the fact that many wartime child labor problems are continuing and new ones arising, the National Commission on Children and Youth, an outgrowth of the National Commission on Children in Wartime, is emphasizing the need for job placement services, skilled employment counseling, programs of combined school and work, and other services to assist prospective young workers in their hunt for suitable employment.

PROBLEM OF KEEPING MINORS IN SCHOOL

The National Child Labor Committee, in addition to working for laws which will bar all employment during school hours for children under 16 years of age, for the elimination of exemptions for children under 16 in compulsory school attendance laws, for regulation of the type and amount of employment which school-age children are permitted to undertake in addition to their school work and for better enforcement procedures, has turned its attention to the question of what kind of educational programs are needed to interest young people in remaining longer in school. The Committee undertook, in 1945, a study of one type of program—part-time school and work under school supervision and control. These programs were developed in a number of school systems during the war with the immediate objective of enabling the students to assist in the war effort without leaving school or working long hours after school.

Some of the schools used the opportunity to test the educational values of a controlled work experience for students whose needs are not met by the regular curriculum. A report of this study, based on field visits to cities having representative work-study programs under school supervision, was published in 1946 and has attracted the interest of many educators. In considering the continuance and future development of these programs the report suggests: "(1) That such programs, if they are to be continued will need careful evaluation and the adoption of definite procedures and safeguards that could not always be provided in the many rapidly developed, and often large-scale, programs that were set up under wartime pressures, and (2) that such programs, though they should not be regarded as the solution of all the problems in secondary education, may become one of the many resources that will be developed and provide more meaningful educational experience for secondary school students than the usual school curriculum now does."

There is an increasing awareness among educators that changes in the high school curriculum have not kept pace with changing requirements and interests of the student bodies. An intensive study of a large number of young people who have dropped out of school, to determine the real factors that prompted their withdrawal, and what changes in the school programs might have encouraged them to remain in school, is needed. The extent of school drop-outs is considered by many educators to be the major problem in secondary education today. It is also a major child labor problem, since discontent with school brings a large number of school-leavers, with little preparation for employment, into the labor market every year.

AGRICULTURE AND CHILD LABOR

Because most child labor and school attendance laws specifically exempt work in agriculture and domestic service from their provisions, employment in these occupations accounts for the largest number of children who are out of school for work. These are the children whose loss of schooling and whose long working hours will not be reduced until legal provisions for their protection are enacted. Extension of Federal and state child labor laws to include children employed in commercialized agriculture was one of the most important phases of child labor legislation on which activity had to be suspended during the war years, and upon which immediate and concerted effort is now needed. Both the National Conference on Labor Legislation and the Children's Bureau General Advisory Committee on the Protection of Young Workers emphasized this need at meetings held in 1946.

The concern over the wartime increase in the agricultural employment of young people was accompanied by renewed interest in improving the working and living conditions of migratory farm families and their children. Conditions in migrant labor camps were conspicuously inferior to those in the camps provided during the war for workers recruited from the West Indies. Migrant families are becoming more numerous because, as reconversion proceeds and farmers' needs for labor continue undiminished, migrants who found other work in the war years are returning to agricultural labor. Unless legal measures are taken to enable the children of migrants to attend school until they are old enough to work they will continue to work when other children are in school and under the worst possible conditions. Legal measures must also be taken to require the improvement of living conditions in migrant labor camps.

ACCIDENTS TO MINORS

The number of accidents to minors increased greatly with the increased employment of young people during the war. Though still heavy, it has decreased somewhat since the war's end. During 1945, in Illinois, 1,752 minors under 18 years of age received compensation for injuries received on the job, an 18 per cent decline from the 2,146 reported in 1944. The corresponding 1940 figure was 282. In the first six months of 1941, there was 78 compensable injuries to minors under 18 reported by the Michigan Department of Labor and Industry. For the same period of 1945 the figure for such injuries rose to 410 and for the first six months of 1946 dropped to 240.

Regulations prohibiting the employment of minors under 18 years of age in occupations declared to be hazardous are included in the provisions of the Fair Labor Standards Act. A new Order, which became effective September 1, 1946, added the operation of power-driven, hoisting machinery (including elevators) to the occupations previously declared hazardous. The previous six Orders, and the Advisory Standards for hazardous occupations issued by the Children's Bureau during the war, in lieu of new Orders, played an important role in the protection of young workers from hazards in many war industries. In the future, hazardous occupations Orders will be issued by the Secretary of Labor instead of by the Chief of the Children's Bureau (see paragraph Children's Bureau Transfer).

STATE AND FEDERAL VIOLATIONS

Reports of state and Federal inspectors show that violations of child labor laws continue to be high. Children found employed in violation of the Fair Labor Standards Act, during the last six months of 1945, totaled 3,787, more than four times the number for the corresponding period of 1940, about the same as in 1943, and somewhat fewer than in 1944. Although figures are not available for all the states, those which are available are significant. Inspectors of the Alabama State Department of Industrial Relations found 662 violations of the Child Labor Law in the first nine months of the fiscal year 1945-46 as compared with 926 for the same period of the previous year. During 1945 there were 229 complaints alleging illegal employment of minors under 18 filed in the San Diego office of the California Labor Commissioner. There were 313 similar complaints filed in 1944. In North Carolina the Labor Department found 1,663 violations of the Child Labor Law during February, March, and April 1946, while there were 1,949 such violations found in the same months of 1945.

CHILDREN'S BUREAU TRANSFER

In accordance with the terms of the President's Reorganization Plan #2, the Children's Bureau was transferred from the Department of Labor to the Federal Security Agency in July 1946, with the exception of the Industrial Division. This Division, which administers the child labor provisions of the Fair Labor Standards Act, was retained in the Department of Labor where it was transferred to the Division of Labor Standards and renamed the Child Labor and Youth Employment Branch. In announcing the latter transfer, Secretary Schwellenbach said that, in addition to the child labor functions, "the new Branch will be expected to promote better working conditions for minors, develop and promote standards for their employment protection, and measures for advancing their opportunities for suitable work."

STATE LEGISLATION

The outstanding legislative gain in 1946 was made by Georgia which enacted a new child labor law establishing a 16-year minimum for employment in factories and certain other mechanical establishments at any time and for all employment, except in agriculture or domestic service, during school hours. This complements the 16-year compulsory education law passed by Georgia in 1945.

Another major achievement was the enactment of the Massachusetts law which makes a beginning toward regulation of agricultural work by forbidding the work of children under 14 on farms for more than four hours a day or 24 hours a week. New York extended until July 1, 1947, the provision which requires minors between 14 and 16, working in farm service, to obtain farm work permits, and also the provision which permits the release of school pupils for planting and harvesting.

In Louisiana, Virginia, and New York revisions were made in the street trades sections of the child labor laws. Louisiana made permanent the wartime provision which sets a minimum age of 12 for boys delivering and collecting newspapers over fixed routes in residential areas, though early morning work was prohibited by limiting delivery to afternoon papers, and Sunday morning delivery was permitted but boys under 14 may not begin work before 6 a.m. The Virginia provision lowered the hour standards for boys between 14 and 16 delivering newspapers by permitting them to begin work at 5 a.m., instead of 6 a.m., but strengthened another provision by providing for the issuance of certificates, limited to those physically fit, rather than street trades badges to newsboys. The certificates are good only as long as the boy's school record indicates that school and work are compatible. New York took the reverse action by doing away with the previous requirement of a thorough physical examination by a physician for street trades badges. A new section requires only that the school physician or nurse or the minor's physician issue a statement indicating that the minor is in sound health and is physically qualified to engage in a street trade.

The establishment of cooperative school and work programs in New York's public schools will be stimulated by the new law which provides that, when state aid is apportioned to each school district maintaining part-time cooperative or apprentice training schools, the days spent in employment by the pupils attending such schools shall be considered as days spent in school and shall be counted when the average daily attendance is computed. Kentucky strengthened her school attendance law by increasing the minimum school term from seven to eight months.

SERVICES AND PUBLICATIONS

The National Child Labor Committee (419 Fourth Avenue, New York 16, N. Y.) offers information on child labor conditions including changes needed in the provisions and administration of child labor and compulsory school attendance laws. It cooperates in drafting and procuring the passage of legislation, publishes educational material, and carries on activities to promote better educational and employment opportunities for youth.

In 1945-46 the National Child Labor Committee issued the following publications: *The American Child* (published monthly, October through May); *Annual Report* for the Year ended Sept. 30, 1946, by Gertrude Folks Zimand; *State Child Labor Compulsory Education and Related Legislation—1946*, by Louise D. Stetter; *Look Before You Leap* (addressed to young people who are thinking about leaving school to go to work), by Lazelle D. Alway; *Margin for Living—The 40 Hour Week*, by Florence Taylor; *Work Experience in Secondary Education: A Study of Part-Time School and Work Programs*, by Harold J. Dillon.

RELIGION AND RELIGIOUS ORGANIZATIONS

INTERDENOMINATIONAL ACTIVITIES

By Preston King Sheldon
Editor and Writer

CONCERN WITH WORLD PEACE PROBLEMS

The release of atomic bombs in the Second World War had by 1946 startled a large part of the religious world out of a somewhat neutral, if not irresponsible, attitude toward the problem of establishing peace in the world. Increased anxiety concerning the war problem was noted on every hand. Emphasis was intensified in study and action groups in America in behalf of better understanding among all races and freedom for all creeds and peoples. In every phase of social life, economic and political, religious leaders delved into problems, studied them, and made pronouncements. Work among minorities was particularly noticeable, but a fraternal spirit was called for to reach through all social levels as the important first step toward peace. In addition to promoting projects through education, which were intended to help solve human problems, church organizations called directly upon government officials or informed them by written statements as to their attitudes on public questions. This was particularly true of problems of the United Nations.

International control of atomic energy was prominent among the demands. Standing at the head of actions among religious groups must be placed that of a conference called by the World Council of Churches and the International Missionary Council in Cambridge, England, in August, 1946, in an effort to map global strategy for the maintenance of world peace. As an outcome, the Council, which in addition to representatives of Protestants in 15 countries, included representatives of Eastern Orthodox churches, announced a determination to implement its voice in international problems through a Commission of the Churches on International Affairs set up at Cambridge. It was given the task of mobilizing political support for peace aims in consonance with Christian principles. Ways were to be sought by which Christians might be brought into contact with the United Nations and other international organizations. A charter was adopted which was intended for ratification by the respective constituencies as a priority over all other tasks. Fear of war in the immediate future was registered in the thinking and speaking of several churchmen among the 60 at Cambridge. The seriousness of the problems in international affairs was seen as calling for all churches to bend themselves to the job of creating a will to peace. The Commission was asked to encourage the forming of local commissions by the churches in liaiso with the larger effort. The Interna tional Missionary Council joine forces with the World Council o Churches in assuming responsibilit for administering the Commission' program.

The Commission was to be com

posed of some 30 churchmen from 18 nations of whom five were chosen from the United States, as follows: John Foster Dulles; Bishop G. Ashton Oldham of the Episcopal Diocese of Albany, N. Y.; Bishop G. Bromley Oxnam of the New York City Methodist Area; Reinhold Niebuhr of Union Theological Seminary; and Dean Virginia Gildersleeve of Barnard College.

In the preamble to a statement, the conference in Cambridge declared: "The nations are faced with the necessity of political action of unprecedented gravity." The conclusion was in part that "we must avoid every action which might increase the mutual distrust which threatens the peace of the world."

ECUMENICAL INSTITUTE IN SWITZERLAND

An Ecumenical Institute, made possible through a gift of $1,000,000 by John D. Rockefeller in 1945, part of which was allocated for the purpose, was opened in October, 1946 at Celigny, Switzerland, in the Chateau de Bossey, which had been used by Mount Holyoke College before the Second World War to accommodate personnel and students in courses given in connection with the Women's College of Geneva. The Institute was established to train young leaders in religious work under the guidance of the World Council of Churches. It had 60 students from war areas in Europe and Asia when it opened.

RELIEF ACTIVITIES

The Provisional Committee of the World Council of Churches held its first post-war meeting in February in Geneva with representatives from allied and ex-enemy countries and urged the Allied governments and the United Nations to take steps to provide food relief for populations transferred in conformance with the Potsdam proposals and to oversee proper settling of such populations in new surroundings. It also urged the General Assembly of the United Nations to carry forward relief work that was to be dropped when the UNRRA was discontinued. Five presidents were elected to hold office until the first World Assembly of the World Council of Churches in 1948. They were the Archbishop of Canterbury, Marc Boegner of France, Archbishop Germanos of the Eastern Orthodox Church, Archbishop Eidem of the Church of Sweden, and John R. Mott. Dr. Mott, a founder of the Foreign Missions Conference of North America and president of the World's Alliance of Young Men's Christian Associations, was named co-winner of the 1946 Nobel Peace Prize and honored at a testimonial dinner in New York City in December at which Bishop G. Bromley Oxnam, former president of the Federal Council of Churches of Christ in America read tributes from public leaders in many countries.

The World Council of Churches reported that, by the end of 1946, a total of 96 denominations in 33 countries had joined, an increase of eight new bodies. A drop of one was noted as the result of a merger, and one of the smaller bodies withdrew.

CHURCH WORLD SERVICE

Consolidation of three overseas agencies of American Protestant churches took place in May, 1946, when the former Church Committee on Overseas Relief and Reconstruction, the Commission for World Council Service, and the Church Committee for Relief in Asia united to become Church World Service. Harper Sibley was chosen president and Dr. A. Livingston Warnshuis executive vice-president. It was estimated that the next four years following the merger, at least $50,000,000 in money and contributed supplies for overseas relief and rehabilitation would be sent out through denominational channels, and a similar amount would go through Church World Service channels. A total of more than 10,000,000 pounds of "goods in kind" was reported in September as shipped overseas during the first post-war year of interdenominational Protestant relief. The estimated value was $4,768,108. The shipments went to 29 countries.

A total of $12,000,000 was being sought by Church World Service as the year drew to a close, to finance 1947 foreign relief operations.

SPECIAL FEDERAL COUNCIL MEETING

Reporting on atomic warfare at a special meeting of the Federal Council of the Churches of Christ in America in Columbus, O., March 5-7, 1946, a commission of 20 religious educators characterized use of atom bombs as "irresponsible" and likely to produce greater irresponsibility if not stopped. "We are agreed that the surprise bombings of Hiroshima and Nagasaki are morally indefensible," they stated. With the exception of one section, which called for civilian control of atomic research, which was adopted, the report was referred to the executive committee.

President Harry S. Truman in an address given personally called on the Church to realize its "supreme opportunity" at once to achieve its mission. He said that "The Protestant Church, the Catholic Church and the Jewish Synagogue, bound together, must provide the shock forces to accomplish" moral and spiritual awakening. "Unless it is done," he added, "we are headed for the disaster we would deserve." The special meeting was attended by 500 representatives of 27,000,000 Protestant church members.

DR. NIEMOELLER IN THE UNITED STATES

The Council's biennial meeting was convened in Seattle, Wash. Dec. 4-6. The high point of the sessions was an address by Martin Niemoeller, militant German Lutheran pastor, who had arrived for a speaking tour. His tour was challenged by Mrs. Franklin D. Roosevelt in her newspaper column "My Day" while the biennial meeting was in session. A telegram was therefore sent immediately from the assembly of delegates, expressing regret over her criticism. The telegram declared she had been misinformed as to incidents connected with Niemoeller's offer to join the German Navy in the Second World War. Mrs. Roosevelt, in her column, mentioned having heard of this offer and that it was her understanding Niemoeller resisted the Nazis merely because of "what they did to the Church, but that he had no quarrel with them politically." It was acknowledged by himself among his friends that the offer had been made, but he explained his purpose as a desire to help overthrow Hitler and that he was seeking to gain his freedom by an offer to serve in the navy as he had in the First World War.

THE COUNCIL AND UN

A telegram was also sent to Senator Warren Austin, head of the United States delegation of the United Nations, among other things asking "our government to advocate policies which will bring into force at the earliest possible moment the trusteeship provisions of the Charter." Multilateral control or inspection under an appropriate agency was favored for the Japanese mandated islands. In view of the coming end of UNRRA, the Federal Council's delegates also urged the Federal Government to take steps to replace its work with "such arrangements with other countries, in supplying their needs for food, as will help to reestablish their independence at the earliest possible moment, stimulate their economic recovery and strengthen the ties of international friendship in such a way as to undergird world order and peace." The Council also committed itself "to the principle that relief of human suffering must not be used for political ends." Commendation was given to the United States Senate for "appointing a committee to investigate charges such as are brought against Senator Bilbo of Mississippi," . . .

CONSCIENTIOUS OBJECTORS

A recommendation on behalf of the welfare of released conscientious objectors was made, along with reaffirmation of "gratification with the recognition accorded conscientious objectors to war under the Selective Training and Service Act of 1940." The statement of the Council added: "We express again our desire that the work of the conscientious objectors shall be utilized to the maximum social advantage; that religious and social organizations should have access to the services of qualified civilian public service assignees who may seek work with such agencies; that conscientious objectors should be permitted to engage in programs of relief and rehabilitation at home and abroad." Earlier in the year, the executive committee of the Council sent an appeal to President Truman for the proclamation of a general amnesty for conscientious objectors still in prison. The Council supported this in Seattle. Also the Council's committee in charge of their problems issued a booklet in the Spring to aid local church leaders in helping returning conscientious objectors become resettled under peace conditions.

THE FEDERAL COUNCIL AND LABOR

The Labor Day message of the Federal Council of Churches emphasized as "indispensable to the realization of the common good," that there be "an annual income adequate for a worthy standard of living; an economy of high production and full employment; the provisions of decent housing and assured medical care; equal access to employment regardless of race and creed and the wider distribution of property and income and power." Labor and management were called on to give precedence to the common good. Admitting of a larger number of displaced persons to the United States was urged by an executive committee statement in September. This was in support of President Truman's "announced intention to seek liberalization of immigration regulations to cope with resettlement needs." An appeal for support of this move was also made at Seattle by the Council. Another appeal was made to all communities to join in an effort to reduce the divorce rate, noting that in 1945 there had been one divorce in every three marriages in the United States. This went out from the executive committee in October.

DR. CAVERT'S REPORTS ON GERMANY

Julius Bodensieck, of the Wartburg Theological Seminary in Dubuque, Ia., was chosen by the Federal Council of the Churches of Christ in America in September, to succeed Samuel McCrea Cavert, general secretary of the Council, as a permanent Protestant liaison representative between the American Military Government in Germany and the German Church, under a plan authorized by the President of the United States and the Secretary of War. Dr. Cavert had been in Germany for a month, starting July 7, 1946, serving as liaison representative under a temporary arrangement. He gave a second report on his return, having given a brief one to the bi-monthly meeting of the Federal Council's executive committee on March 19, following his return from a previous six months' stay in Europe. On his earlier trip he worked with the Provisional Committee of the World Council of Churches in Geneva. Switzerland. which he had termed "the most hopeful thing on the European horizon." He discussed this trip in April at a luncheon of the American Committee of the World Council of Churches in an address. He expressed a belief that future activities of the World Council could be depended upon to improve post-war relationships.

His later report was made to the executive committee of the Federal Council in September. He said that "the main impression with which I return has to do with the necessity for a better understanding of the German situation on the part of the American people. When they thoroughly understand the situation I am convinced that American public opinion will support a constructive policy of humane and considerate treatment of the German people." As to the relation of the American Military Government with church life in Germany, Dr. Cavert explained that it came "into the religious situation only at those points at which the Church exercises functions and has relationships of a secular character; more specifically, functions and relationships which impinge upon the sphere of the State. Among those problems which involve Church-State relations are the administration of the property of the Church, the financing of the work of the Church, legislation affecting the Church, and the program of religious education in so far as it is tied up with the general educational program of the community." He told of the services outside these needs which fell into the special province of the liaison representative from American churches and emphasized the importance of meeting them, such as training of ministers, winning the loyalty of young people to the Church; the Christian social program of the Church; and the place of the German Church in the ecumenical movement. He completed arrangements with Lieut. Gen. Lucius D. Clay, deputy military governor in the American zone in Germany, for the performance of services by the liaison representative of the Federal Council who was to come later. Dr. Cavert also announced the World Council of Churches was working on plans to have similar representatives in the American and also the British zones of occupation in Germany. He reported having seen about 50 pastors on his trip.

AMERICAN-SOVIET RELATIONS

Another sphere of international relations where the Federal Council took care to make a pronouncement was that of Soviet-American relations. The Commission on a Just and Durable Peace published a lengthy statement in October in which it was declared: "War with Russia can be avoided and it must be avoided without compromise of basic convictions. . . . Marxist communism in its orthodox philosophy stands clearly opposed to Christianity. . . ." Nevertheless, the statement continued, "We are convinced that a dynamic and fruitful peace can prevail in a world society where conflicts of faith are unavoidable."

Stating the concern of Christians in America for "the progressive realization of the dignity and worth of man in every area of life, political, economic, social and religious, to the world-wide achievement of man's individual freedom, under God, to think, to believe, and to act responsibly according to the dictates of his own conscience," the statement continued: "Within the Soviet Union there are many people who share such Christian beliefs. Moreover, communism as an economic program for social reconstruction, has points of contact with the social message of Christianity as in its avowed concern for the underprivileged and its insistence on racial equality." It described, as points of difference, the atheistic base of the communistic philosophy, its utopian philosophy of history, and its revolutionary strategy, the latter involving "the disregard of the sacredness of personality which is fundamental in Christianity." The statement declared, however: "People everywhere must recognize that differing beliefs and practices are normal in world society, now and in the future. Also, they must see that those who hold beliefs firmly will seek to propagate them without dilution or compromise. There is a widespread feeling that if different beliefs and institutions come internationally into competitive contact, armed conflict is inevitable. That is why some identify world peace with world conformity. Others seek peace in terms of zones of influence which would insulate one faith from another. When neither attitude is practical, as is the case today, they become obsessed with fear. . . . Such attitudes account for much of the danger in the present situation."

The statement called for an end to intolerance and armaments, and called for international cooperation and a more intimate association of the American and Russian peoples, in which they would collaborate in scientific, economic, cultural, and religious problems. A demonstration of democratic practices by democracies was seen as "the surest way to relieve the competitive strain." Courteous and frank discussion of issues and attempts to harmonize divergent points of view through the United Nations were urged.

In connection with the field of Soviet-American relations, Ralph W. Sockman, chairman of the executive committee of the Church Peace Union, and Louie D. Newton, president of the Southern Baptist Convention, spent four weeks in Russia in the summer of 1946, as members of a delegation of the American Society for Russian Relief. They returned and reported on religious life in the Soviet Union and that they had visited churches and talked with many religious leaders. "So far as we were able to observe, there is freedom of religious worship," they reported, after a trip of more than 5,000 miles by air within the Soviet Union. They stopped at many cities. "All the ministers and other religious leaders with whom we talked assured us that there was no governmental censorship of the pulpit. Of course the pulpit does not conceive its message to cover certain social aspects which our American ministers discuss. However, the churches do have their own philanthropies and may present petitions for the redress of any community problem.

"The Russian religious leaders with whom we spoke stressed strongly the separation of Church and State. Both government officials in charge of church relationships and ecclesiastical leaders with whom we spoke agreed that church membership is growing. Certainly we had ample evidence of religious interest in the crowded churches which we visited and in the long queues of people awaiting admission so that they might join in church services. On several occasions, we were given an opportunity to extend greetings to the worshippers at churches, including Jewish congregations. . . . We found a number of churches making improvements to their buildings, an indication, we feel, of the forward strides of religious faith in Russia."

THE CHURCHES IN AMERICA

During the five years ended Oct. 25, 1946, the number of state and local councils of churches in the United States of America had grown from 247 to 634, or more than double, and the combined budgets had been tripled from $1,800,000 to $6,100,000, according to a report to the Intercouncil Field Department of the Federal Council of Churches. A substantial gain was noted in the field of women's groups because of the organizing in 1941 of the United Council of Church Women. The total of local women's councils was at that time 375, and at the end of five years it had grown to 1,400. In 1942 there were 15 state councils, in 1946 they had risen to 41, with four additional states in process of organizing.

In connection with the publishing of the five-year report, a detailed additional report covering 19 months was submitted which disclosed that new councils had been established with full-time executive leaders in that period in 16 cities and councils with voluntary leaders in 12 local areas. Steps were being taken to organize others in 23 more cities.

A group of surveys over a 2½-year period conducted under the auspices of the Committee for Cooperative Field Research of the Federal Council of Churches and the direction of H. Paul Douglass, disclosed trends toward greater cooperation in several metropolitan areas among churches in federations or councils. Fewer and better churches were being urged for these larger areas, to be manned with personnel trained to deal with recurring urban social problems. A table of suggested methods was in use, based on previous experiments, to aid in adjusting church work to changing social environments. Although developed during war years, many conditions remained unchanged through 1946, so that the methods were still of use. More than 30 objectives were included as the goal of achievement in the immediate post-war years. Included in the adjustments listed were relocating, federating of churches, forming of new churches, using older ones as nuclei; transfer of field and property to other denominations or churches; developing larger parishes; encouraging multiple constituencies; joint use of property by two or more churches; use of "adjunct institutions," such as neighborhood houses or Christian centers; and branch and Community churches.

The general objectives included the overcoming of handicaps of underlying subnormal conditions; more adequate meeting of social and community changes; accepting responsibility to minister to special conditions; and seeking to increase Christian solutions for emergent ethical issues. Specific objects included setting up continuous research; continuous cooperative planning; maintenance of proper balance between central and peripheral churches; adopt common policy for organizing new churches with special reference to suburbs; adapt churches to suburban expansion; devise church programs to match special neighborhood needs; continue emergency ministries in war housing projects; take advanced ground on the relations of racial groups and churches; maintain solidarity despite theological differences; pool Christian resources to serve the neediest in the community; develop a religious master plan for the metropolitan community; and make common cause with constructive secular community planning movements.

The department of race relations held its seventh annual conference of church leaders in April at Lincoln University, in Pennsylvania, in cooperation with the Home Missions Council of North America. Among the urgent recommendations that followed were emphasis upon the need for a better informed Church, improved leadership, and protection and encouragement of minority racial groups.

UNITED COUNCIL OF CHURCH WOMEN

The third biennial assembly of the United Council of Church Women was held Nov. 11-15 in Grand Rapids, Mich. Plans were formulated by which the women agreed they would consider affiliating in a proposed new National Council of the Churches of Christ in America, bringing together interdenominational groups collaborating with the Federal Council of the Churches of Christ in America. A continuing committee on procedure was named. State and local councils of churchwomen were urged to make a united impact on all segregation practices in the community life of the nation, giving particular emphasis to enforcement of civil rights laws; interpretation and enforcement of the U. S. Supreme Court rulings on transportation, education, and the right to vote in all states having separation laws, and voting restrictions and breaking the pattern of segregation in Washington, D. C. The women pronounced their opposition to lynching and mob violence, to peacetime compulsory military training, and urged universal disarmament, the study by women of the churches of labor-management problems, and a sympathetic concern for alcoholics. More than 1,500 women attended, representing 72 denominations and 18 foreign countries.

HOME MISSIONS COUNCIL

More than 1,000 Protestant rural churchmen attended the third annual convocation on town and country problems Nov. 12-14 at Des Moines, Ia. under the auspices of the Home Missions Council, the Federal Council of Churches, and the International Council of Religious Education. A highlight was a 70-page report by H. Paul Douglass, director of the Committee for Cooperative Field Research of the Federal Council, covering rural churches in Iowa. It showed overchurching and "rather low" effectiveness for the average rural church in that state. The survey was begun in January, 1946 with the collaboration of the Iowa Interchurch Council and the Iowa Christian Rural Fellowship, and covered communities chosen by eight denominations. Another speaker was Monsignor L. G. Ligutti, executive secretary of the National Roman Catholic Rural Life Conference, who looked upon small rural communities as protection against atomic destruction. A meeting of representatives of rural interests of Protestant denominations in the United States, Canada, and several other foreign countries went into the land problem also in New York City in May, in a session devoted to study and hearing of reports on the problem in this and other countries.

The Home Missions Council reported holding spiritual and social programs for 90,000 agricultural migrants in 17 states during the 1946 food production season, at a cost of $72,000. At the closing session of the annual meeting held in January, 1946 at Buck Hill Falls, the Home Missions Council delegates adopted a statement on principles which was referred to the executive committee to be used in drawing up a document for disposal at the 1947 annual meeting. Among the principles evolved was that "definite steps must be taken to remove conditions which foster continuous mobility of populations. Permanency of community life must be reestablished in order to permit the full and free development of Christian personality and group life." A basic strategy for eliminating migrancy was asked. Also the training of more Christian leaders in labor and management problems, and new commitments in home missions through interdenominational cooperation. A budget of $326,092 was adopted for 1946, which was $72,000 higher than that of 1945.

THE AMERICAN BIBLE SOCIETY

The society published in 1946 a report of its activities, stating it had distributed in the 130th year of its history in 1945 a total of 12,243,355 volumes of the Scriptures and that the average the preceding ten years had been 8,251,197. It promoted a world-wide Bible reading program from Thanksgiving to Christmas in place of its previous domestic program. Louie D. Newton, president of the Southern Baptist Convention, in a report to the society on his trip to Russia, said he had preached in Baptist churches there, and everywhere he went he found bibles. J. I. Zhidkov, president of the All-Union Council of Evangelicals and Baptists, and Mikhail A. Orlov, pastor of the Moscow Baptist Church, sent thanks through Dr. Newton for Russian New Testaments sent to Russian prisoners of war.

AMERICAN MISSIONARY ASSOCIATION

The American Missionary Association, which was organized Sept. 3, 1846 in a Baptist Church in Albany, N. Y., celebrated its 100th anniversary in 1946. The Association was organized on a non-denominational basis, but in 1937 completed arrangements for the Board of Home Missions of Congregational Christian Churches to act as its agent, retaining its original status. In its first 100 years it had started and divested itself of 500 schools and colleges on the principle of letting go its control over institutions able to continue with other aid. Often, such institutions were placed in the hands of public boards of education. The Association was organized in the days of anti-slavery agitation and was abolitionist. Since the Civil War, attention has been turned to the rights of minorities spearheading freedom for Negroes, Southern Highlanders, Jamaicans, Hawaiians, Orientals, Indians, Eskimos, and Puerto Ricans. Its race relations department was established in 1943.

INTERFAITH PRONOUNCEMENT

The first post-war pronouncement on economic justice, signed by Roman Catholic, Protestant, and Jewish leaders, came out in 1946 with 122 signers. Other pronouncements had been issued in 1938 and 1940. It emphasized that the moral law must govern in economic life and that the moral purpose of economic life is social justice. "To make the profit motive the guiding principle in economic life is to violate the order which God himself has established," it declared. It called for voluntary organizations of workers, farmers, employers, and professional people without regard to race, creed, color, or nationality, "to assume their full responsibility for the ethical conduct of their own industry or profession and for the economic welfare of the community." Organized cooperation was recommended as a substitute for the rule of competition. International life was also subject to moral law, the pronouncement stated, setting forth the obligations of community, state, Federal, and International governments to step in where the common good was not being served by "functional economic groups." In the international field particularly, it called for assistance by national governments and the economic collaboration of groups to help "all States to provide an adequate standard of living for their citizens" through replacement of "the present economic monopoly and exploitation of natural resources by privileged groups and States."

CHRISTIANS AND JEWS

The first International Conference of Christians and Jews was held in Oxford, England, July 30 to Aug. 6, 1946, bringing together 150 members from Protestant, Roman Catholic, Orthodox, and Jewish communities in 15 countries, to deliberate on the fundamental implications of freedom, justice, and responsibility in the post-war world. A particularly deep concern was expressed over diverse forms and degrees of discrimination against, and persecution of, Jews, Roman Catholics, Orthodox, and Protestant believers in Europe. The Conference, in view of the complexity of these and many other problems before the Paris Conference of statesmen who were met to draft peace treaties, gave assurances of support of any endeavor to give effect to the principles of the Charter of the United Nations, which were directed toward "the promotion and encouragement of respect for human rights and fundamental freedoms for all, without distinction of race, sex, language, or religion."

Several German clergymen attended the conference in Oxford, which was held to plan what could be done to prevent on a world scale a rise of hate. It was decided to establish a permanent World Council of Christians and Jews and set up a workshop in Zurich, Switzerland, to start on a program led by scientists, educators, religious leaders, and statesmen. A message was sent to the Paris Peace Conference, urging that provisions be written into treaties with defeated countries to forestall discrimination against minorities.

YOUNG MEN'S AND WOMEN'S CHRISTIAN ASSOCIATIONS

The forty-fifth international convention of the Y. M. C. A. was held in March at Atlantic City, and was attended by 2,000 delegates who sent out a call to all units in the United States and Canada, urging rededication to the task of eliminating racial discrimination. An upward trend was reported in the improvement of race relations since 1931, when a previous resolution calling for racial equality had been adopted. The delegates pledged themselves on behalf of training leaders for world citizenship in their own organizations and to seek alignments with religious and educational organizations working to the same end. A budget of $8,657,932 was adopted to be applied toward financing the rebuilding and re-equipment of Y. M. C. A.'s in war-torn areas. A post-war reconstruction program was mapped out to cover from three to five years. More than 80 buildings were reported destroyed in Europe and the Far East.

The annual convention of the Young Women's Christian Association in Atlantic City in the spring of 1946 adopted recommendations calling for a broadening of relations with Negro women as members and a continued study of interracial practices of all groups.

PROTESTANT DENOMINATIONAL ACTIVITIES

By Preston King Sheldon
Editor and Writer

DENOMINATIONAL CONTRIBUTIONS

Indications from available data at the end of 1946 were that contributions for all purposes by Protestant congregations in the United States and Canada, were higher than in 1929 by 19 per cent and than in 1945 by 20 per cent. The United Stewardship Council reported that the total giving recorded in its statistics for 1946 had come to $613,898,510, as compared with $514,992,105 for 1929, when five denominations were included which did not report in 1946. The report stated that "the denominations reporting this year that did not report in 1929, all made contributions smaller than the average for the denominations of their size." Two denominations, however, were added for the first time in 1946, the Brethren Church (not to be confused with the Church of the Brethren), and the Baptist Maritime Provinces in Canada.

A total of 26 denominations reported in both countries. There were 21 reporting from the United States with a total of $591,254,555 for 1946 as compared with $492,198,185 the year previous. Part of the increased giving was the result of drives for funds for post-war rehabilitation, including money for food and clothing as well as rebuilding.

MEMBERSHIP GROWTH AND TRENDS

Dr. F. Ernest Johnson, executive secretary of the department of research and education of the Federal Council of the Churches of Christ in America, in an address at the biennial meeting of the Federal Council of the Churches of Christ in America, in Seattle, in December, said there was reason to believe the rate of membership growth had been accelerated since 1944. He said a study of the membership trend for 1943-44 compared with previous statistics disclosed that 47 Protestant bodies, having as many as 50,000 members in either or both of those years, had increased by about 36.5 per cent during the period. The estimated population growth was 17.9 per cent. This was being continued according to indications shown in reports of many individual Protestant bodies.

CHURCH MERGERS AND UNITY PLANS

The year 1946 saw the merger of the United Brethren in Christ and the Evangelical Church in November. Negotiations for merging, which had been going on between the Protestant Episcopal Church and the Presbyterian Church in the U. S. A. and receiving active support among leaders of the latter communion, were held up by a delay in reaching a decision among the Episcopalians. The triennial General Convention of the Protestant Episcopal Church in Philadelphia, in June, 1946, heard majority and minority reports which were received with expressions of appreciation. The Episcopalian Commission on Approaches to Unity was asked to prepare a statement of faith and order in harmony with the Lambeth Quadrilateral, for report at the next triennial meeting in the Fall of 1949. Meanwhile, study and conversations were being carried on with representatives of the Presbyterians. The latter also were seeking to hasten the movement toward church unity by seeking negotiations with at least one other denomination in addition to the Protestant Episcopal Church and the Presbyterian Church in the United States, or so-called Southern Presbyterian Church. Plans for consolidating agencies of the two Presbyterian bodies were going forward in December, 1946. Their general assemblies which met in May in different cities, exchanged fraternal delegates. A proposed union of the Evangelical and Reformed Church with the Congregational Christian Church, which had been under consideration for five years, was given place on the agenda of the biennial meeting of the latter body's general council in Grinnell, Ia., in June, 1946, at which time additional data was called for and authorization given for calling a special meeting in 1947 on the problem, if warranted.

LAY PARTICIPATION IN CHURCH ACTIVITIES

New impetus was noted in 1946 to larger participation in church activities by laymen. Young lay delegates, 90 per cent of them veterans from 20 Protestant denominations, met at a call from the Federal Council of the Churches of Christ in America and the International Council of Religious Education, at Lakeside, O., Sept. 3-6, to learn what they might do to help as leaders to strengthen the program of their local churches. There were 350 present. A statement adopted in plenary session pledged the delegates to "a reexamination of the whole church program, seeking to make all phases of its work more vital." Special recommendations were also drawn up, looking toward a continuation of this work. The recommendations called upon the two sponsors to "consider the possibility of providing national staff leadership for young churchmen," and before adjourning had established a committee of 16 to work with agencies in any future projects. A special recommendation urged an exchange of young churchmen with Russians in order to foster improved relations with the Soviet Union.

The first annual convention of youth of the Protestant Episcopal Church was held in Philadelphia, Sept. 14 and 15, with 300 delegates attending. They pledged aid to the church's program for rehabilitation and advance; dedicated themselves to study of interracial attitudes and relations; pledged support to the World Council of Churches; approved wheatless days to help feed the hungry; planned active cooperation in world relief; sent fraternal greetings to Christian youth in Japan; approved Christian unity, and allocated an offering to train native Christian youth in Japan.

THE CHURCHES AND THE VETERANS

A score of bishops of the Methodist Church conferred with 500 Methodist veterans from 45 states July 4 to 7 in Columbus, O., who urged the bishops to send a resolution to the Secretaries of War and Navy and other Federal officials calling for immediate release of conscientious objectors on the same point discharge basis as servicemen. Of the 500 delegates who attended this conference, about one-fifth were reported to have been former officers, holding ranks up to Lieutenant-Colonel and Commander. The veterans called upon their denomination "to take leadership in promoting Protestant unification"; "make substantial changes in its educational program"; and "to give veterans and other young men positions of greater responsibility in their churches." They supported "our country's participation in the United Nations," saying they were "convinced that for the preservation of peace we must willingly relinquish some of our national sovereignty." They urged revised procedures to make housing available to veterans; higher moral standards in our armed forces, and reconciliation of the differences between management and labor as a "Christian duty."

PRONOUNCEMENT ON VATICAN REPRESENTATION

Among the denominational pronouncements were continued protests over maintenance of a representative of the President of the United States at the Vatican in Rome, and requests for the recall of Myron C. Taylor from that post.

A delegation of eleven Protestant leaders had an audience with President Truman in June regarding the continuance of the Vatican appointment and reported he had assured them it was but a temporary expedient. The executive committee of the Federal Council, in an action on Jan. 15, 1946, had cited and transmitted to President Truman a statement adopted at the biennial meeting of the Council in 1944 in Pittsburgh, calling for separation of Church and State. (See THE AMERICAN YEAR BOOK, 1944, page 670.) This was brought up again with the actions in 1946 of seven Protestant denominations, at the June audience with the President, together with similar actions announced by more than 30 regional Protestant bodies, running back into 1945.

PRONOUNCEMENTS AGAINST CONSCRIPTION

A new consciousness of the horrors of war was evident among Protestants in 1946 as moves were made against continued compulsory conscription in peacetime, and calls came for release of conscientious objectors from denominations outside the pale of what, until the Second World War, was regarded as the special province of the peace churches. Control of atomic energy was added to the concern of a widening circle of Protestants as the nature of the most recent world conflict through force of arms began to be realized.

Among the denominations pronouncing against compulsory conscription was the Presbyterian Church in the U. S. A., which also asked amnesty for conscientious objectors, control of atomic energy and "immediate ceasing of the manufacture of atomic bombs." Amnesty was also asked by the Protestant Episcopal Triennial General Convention and the Northern Baptist Convention. The Episcopalians also placed themselves "squarely behind the United Nations, urging larger powers." Joining in opposition to continued compulsory peacetime conscription were Northern and Southern Baptists and the Church of the Brethren, the latter maintaining its tradition as one of a group of peace churches and also calling for amnesty for conscientious objectors, having been a leading protector of their rights.

SEVENTH DAY ADVENTISTS

Statistical summaries on Seventh Day Adventist churches throughout the world, at the close of 1945, disclosed a membership of 576,378 in 9,496 churches. Membership outside of North America was 363,864. The denomination had 69 union conferences and mission fields and 510 institutions. Total offerings were $31,540,935 in tithes, gifts for missions and local church work. That part of the offerings designated for foreign missions was $7,837,868. The gain in total offerings was $2,855,501. There was also a gain of 18,418 in Sabbath school memberships, bringing enrollments to 688,281.

The forty-fifth quadrennial world session of the denomination, postponed a year because of the war, was attended by 800 delegates of which 300 were from foreign countries. It was held in Takoma Park, Washington, D. C. Delegates to the denominational Autumn Council in October, in Grand Rapids, Mich., were urged to intensify their efforts, begun in 1945, to provide funds for overseas relief and rehabilitation. The organizing of a corporation to supervise and control increased welfare work was authorized, to be known as the Seventh-Day Adventist Charities, Inc.

NORTHERN BAPTISTS

The Northern Baptist Convention reported, at its annual meeting in Grand Rapids, Mich. in May, 1946, a total of 7,603 churches with 1,468,043 members and 7,716 pastors and missionaries. Total receipts for all purposes were $7,431,736.

Its American Baptist Home Mission Society raised $724,913 for use in cities, missions in Latin America, town and country work, evangelism, public and interdenominational relations, and ministering to service personnel. The American Baptist Foreign Mission Society raised $1,006,812. Its fields included Burma, Assam, Bengal-Orissa, South India, South. East, and West China, the Philippines, Japan, Belgian Congo, and Europe. During the year, 84 new missionaries were sent out.

The Woman's American Baptist Foreign Mission Society celebrated its seventy-fifth anniversary on April 3, 1946, local units participating. Its receipts were $289,954. The Woman's American Baptist Home Mission Society's receipts were $270,574.

The Board of Education and Publication of the denomination reported receipts of $334,755. Its activities included a special study of theological education; appointment of national secretaries for the departments of leadership education, adult work, and family life; development of a national Baptist Assembly at Green Lake, Wis.; missionary education; Christian education and work in the department of schools, colleges and seminaries, of which institutions there were 65.

The major project of 1945-46 was a World Mission Crusade for $14,000,000 for world relief, rehabilitation, and missions promotion, which was to end April 30, 1947. As part of this campaign, a Christian Life Crusade was conducted throughout the churches of the denomination. The emphasis covered world missions, returning service personnel, evangelism. Christian education, stewardship, and Christian social progress. A training center was established at the National Baptist Assembly in Green Lake, Wis. to train 180 pastors and laymen for the Christian Life Crusade work in 34 areas in which institutes were conducted.

Resolutions adopted at the annual meeting of the Northern Baptist Convention in May included those supporting the United Nations and control of atomic energy; opposing compulsory military conscription in time of peace, and asking that "conscientious objectors now in civilian public service camps be released in proportion to the release of servicemen and women." Opposition was again raised to the continued appointment of Myron C. Taylor as representative of the President of the United States at the Vatican. Other resolutions called for strengthening the moral and spiritual foundations of our national life; building of more homes; returning of people to the land; a program of juvenile protection; urged the importance of exercising the right to vote; better industrial relations among employers and employees; establishment of a permanent fair employment practices commission by the Federal Government; and requested the State Department to encourage complete religious freedom in all those countries with which it entered into treaty agreements and "to use its influence in every possible way to assure the just administration of such laws as may be enacted to protect the rights of minority groups."

The denomination's Council on Christian Social Progress initiated for 1946-47 a campaign against liquor advertising in magazines and over the radio, giving attention to this through committees on youth and women's and men's work. The Council also voted, at a meeting held in New York City in the Spring of 1946, to record its conviction that every effort "must be made by the United States of America to promote mutual understanding between this country and Russia in the interest of cooperative action" through the United Nations for world peace. It also called for international abolition of compulsory peacetime military training:

SOUTHERN BAPTISTS

The Southern Baptist Convention, organized in Augusta, Ga., May 8, 1845, celebrated its centennial a year late, because of war conditions in 1945 except for local celebrations. The annual meeting was held in Miami, Fla., May 15-19, 1946. It had met in Florida three times previously, in Jacksonville, 1911 and 1922, and St. Petersburg, 1932. When the denomination was organized it had 325 representatives from eight southern states and the District of Columbia. At that time there were 350,000 members of Southern Baptist churches, including 100,000 slaves. It was over the question of slavery and other vital issues that Northern and Southern Baptists became separated. After 1814, when the old Triennial Baptist Convention was organized in Philadelphia, Southern Baptists had cooperated with that body.

In the 101 years after 1845, Southern Baptists had spread to include ten other states and southern Illinois. Its membership grew to 5,865,554, and there were 26,134 churches reported in 1946 at the annual meeting. Property value exceeded $276,085,000. Contributions to local church work in 1945 were $75,967,674, and to missions and benevolences $22,490,751, making a grand total of $98,458,425. This was a reported gain of $21,859,005, for all purposes, over 1944.

The Southern Baptist Woman's Missionary Union, through 41,227 units, raised $6,517,322 in 1945, exclusive of contributions for local church work, which was an increase of $129,723 over 1944. There were 4,782 new units set up, bringing total enrollments to 739,360, of whom 338,896 were young people.

The Sunday School Board reported an increase of 459 Sunday Schools and a rise of 152,401 in total Sunday School enrollments. Receipts in 1945 were $4,526,751, an increase of $368,866 over 1944. This brought the Sunday Schools to 24,968 and the total enrollment to 3,525,310. A total of 50,391 training unions reported an enrollment of 703,332. Vacation Bible schools were increasing, the total for 1945 being 10,222 with 801,218 enrolled. The total circulation of all periodicals was 26,193,273, an increase of 2,093,586 over 1944.

The Southern Baptist Education Commission reported a goal of $23,165,000 for endowing and building educational institutions of the denomination. Its 60 schools had a drop of about 10,000 in enrollments in 1945, because of the war, the decreased number being 21,000. This was overcome the following year when more than 35,000 enrollments were reported, a record figure. The total endowments, when the drive for additional finances was announced, was $85,318,844.

The Relief and Annuity Board reported annual income of $2,676,451. Its assets had grown from $106,428 in 1919 to $9,447,714 at the end of 1945. These had been increased by more than $1,500,000 in that year and were above $10,000,000 by the time the centennial meeting ended in May.

CHURCH OF THE BRETHREN

The Church of the Brethren, whose members were early known as "peace seekers" and were obliged to leave Germany because of their religious convictions, within a decade after the body was organized in 1708 was one of three peace churches responsible in the Second World War for maintenance and administration of Civilian Public Service Camps set up as centers to be used for wartime work of conscientious objectors to military service. It reported in the Fall of 1946 that about 14 per cent of all conscientious objectors in such camps were from its membership. At one time it operated 14 of its own camps.

Its council of boards reiterated an historic stand at an executive session in Elgin, Ill., Nov. 13, 1946, when it called on President Truman "to use Christmas of 1946 as the occasion for proclaiming a general amnesty for conscientious objectors." A statement coming from a conference of the board declared: "Believing that no amount of armament can protect a people from the ravages of war, the Church views with dismay the preparation for future war. Believing further, that disarmament will allay the fears of all people concerning the danger of unwarranted attack, that it will provide the basis for the establishment of a stable peace, and that it will release human energies for the task of rebuilding the world and rehabilitating its people, the Church appeals to all the States of the world to take immediate steps toward worldwide accord for universal disarmament and for the settling of all disputes between nations without recourse to arms." It felt "a special sense of significance" for this appeal following "the recent advocacy and endorsement of the disarmament principle by the United States and Russia."

The Church of the Brethren in its year book for 1946 reported for the previous year, ended Sept. 30, 1945, a total of 1,021 churches with 181,087 members in the United States and Canada. There were 5,489 baptisms, with a net gain of 800. According to reports from 962 church schools, there were 115,586 enrollments in Sunday classes. The denomination had 302 full-time and 467 part-time pastors.

The denomination in 1945 spent $342,000 to meet the expenses of its services to conscientious objectors and in 1946, as these were released, initiated a program to help them get adjusted to the change. Its Service Committee had, in two years, developed facilities at New Windsor, Md. for handling relief materials, offering it to other denominations as a collecting place for shipments overseas. More than 30 denominations accepted and were sending their gifts of clothing, shoes, and food through it. It reached a processing capacity of 175,000 pounds weekly.

A particularly active project developed by the denomination in 1945 and continued through 1946, was the shipping of heifers to needy European families. This project is to be extended two years. In 1945, members of the Church of the Brethren spent $1,055,797 for denominational service projects, principally foreign relief. By May 1, 1946, 1,300 heifers had been shipped. A shipment of 56,000 hatching eggs went to Warsaw, Poland. Included in items shipped in 1946 were garden seeds, cereals, canned foods, soap, books, Bibles, garden tools, and bicycles.

CONGREGATIONAL CHRISTIAN CHURCHES

This denomination reported 1,130,824 members in the United States attending 5,836 churches as of Jan. 1, 1946. In addition there were 121,200 members of 678 churches in foreign countries. The roll of ministers included 5,882 ordained, of whom 3,111 were pastors, 120 denominational officials, 101 missionaries, 263 educators, and 433 chaplains. Gifts for benevolences reported from 5,199 churches totaled $3,951,495. Home expenses were reported by 5,028 churches, and these came to $19,301,121. The total property value reported by 5,514 churches was $171,892,927. Invested funds were reported by 1,920 churches, the total being $31,225,155.

The American Board of Commissioners for Foreign Missions had an income of $1,327,800 and investments of $8,054,338. The Board of Home Missions expenses were $1,626,636, and investments were $25,350,525. The total income of all agencies was $6,232,247, and investments were $52,744,646.

The biennial meeting of the General Council was convened at Grinnell, Ia. in June, where a proposal was defeated 477 to 24 to divorce from it the Congregational Christian Council for Social Action. A committee was authorized to prepare supplementary data on a proposal to merge the denomination with the Evangelical and Reformed Church. Dr. Truman B. Douglass, executive vice-president of the Board of Home Missions, obtained adoption of a proposal to the Federal Council of the Churches of Christ in America, asking it to convene a plenary session of representatives of American churches to consider the possibility of closer unity of American denominations which already were according one another "mutual recognition of ministries and sacraments." A post-war emergency project, calling for $6,114,576, was approved for overseas and home relief. Support was urged of the Acheson-Lilienthal report on international control of atomic energy and of the Baruch proposals before the United Nations Atomic Energy Commission.

DISCIPLES OF CHRIST

The total membership of these churches for the year ended June 30, 1945 in the United States and Canada was 1,701,028 and throughout the world was 1,867,591. There was a gain in the United States and Canada over the previous year of 19,095 and a world gain of 21,762. Total churches for the United States and Canada were 8,004, an increase of six, and for the world, 8;926, an increase of 21. Reports were given for the United States and Canadian churches, showing 7,854 ministers, compared with 7,782 the year before, an increase of 72. Total offerings from churches in these two countries were $8,759,873 Baptisms were 50,607, an increase of 2,412.

The denomination's United Christian Missionary Society reported assets of $7,670,870, compared with $70,071,958 the year before. Total Bible school enrollments were 1,013,679 for the United States and Canada, an increase of 14,190, and for the world, 1,073,478, an increase of 14,776.

PROTESTANT EPISCOPAL CHURCH

A national deficit, which had existed since 1934 because of decreased giving in 1933, amounting to $852,740, had been paid in full by the time of the triennial general convention held in Philadelphia in June, 1946. Lewis B. Franklin, retiring treasurer, announced increased giving, the year 1945 showing a 27 per cent rise over 1943, or an average of $1.25 per communicant per year, for the general denominational program, which was not considered sufficient.

A United Thank Offering of $1,631,576 was handed in at a corporate communion by 4,000 Episcopal women, which was reported the largest such donation in 60 years. Mrs. Randolph H. Dyer, of the Diocese of Missouri, was seated at the convention as the first woman deputy. Former U. S. Supreme Court Justice Owen J. Roberts was elected the first lay president of the house of clerical and lay deputies. The convention adopted a budget of $3,386,887 for 1947, which was $651,829 more than for 1946. The National Council, which administers the business of the denomination in the interim between triennial general convention meetings, was instructed to raise not less than $1,000,000 in each of the three years beginning in 1947 for the Presiding Bishop's Fund for World Relief. This was to be disbursed for relief and inter-church aid programs coordinated by Church World Service through the World Council of Churches and the National Christian Councils in eastern Asia. Bishop Henry Knox Sherrill of Massachusetts succeeded Bishop Henry St. George Tucker as Presiding Bishop. The latter retired Dec. 31, 1946. The convention had as special guests the Archbishops of Canterbury and of the West Indies.

An original goal of $5,000,000 announced in 1945 for reconstruction and rehabilitation of church properties destroyed by war was later increased to $8,800,000, but the total raised as reported at the convention in Philadelphia came to $7,057,919. The national council, in December, 1946, announced plans to disburse somewhat less than this amount but emphasized several million dollars more were needed, particularly in the Orient.

The denomination reported in 1946 having 2,300,575 baptized members and 1,583,338 communicants, respective increases in these classifications of 30,613 and 15,186 over 1945. Total contributions for all purposes increased by $6,841,357 and reached $53,011,393. Church schools had the first increase in enrollments since 1939, the years intervening each having shown a decrease. The total in 1946 was 404,253, and the year's increase was 9,797. The number of postulants for religious orders was 817, the highest on record. Ordinations had dropped in 1945, fewer candidates for the ministry being in training through the war years. There were 178 deacons and 167 priests ordained, representing drops of three and 42. The clergy rosters disclosed 6,450 pastors. There were 7,648 parishes and missions, exclusive of institutional chapels and preaching stations. Adult baptisms totaled 14,243, a gain of 210. Infant baptisms declined 1,090 from 1945, to 71,287. The most notable decrease was in confirmations, there having been 67,076 in 1946 as against the previous year's figure of 68,868. Low enrollments in church schools in 1943, 1944, and 1945 were considered responsible.

EVANGELICAL UNITED BRETHREN CHURCH

An anticipated merger of the United Brethren in Christ and the Evangelical Church took place, Nov. 16, 1946, in Johnstown, Pa. The two denominations were represented in the uniting assembly by 455 delegates. Immediately following the merger, they met in the first general conference.

Statistics prepared for each denomination in advance of the merger disclosed that the United Brethren had a total membership in the United States of 436,525, an increase over the previous year of 3,010. There were 18,213 members in other countries, giving a total of 454,738. A total of $324,452 was received for foreign missions and $200,000 for home missions. Benevolence receipts were $1,924,466 compared with $1,715,676 the year before. The total received for all purposes was $8,395,342, compared with $7,781,249. There were 1,276 full-time pastors, as compared with 1,171 the previous year. Part-time pastors had dropped from 325 to 243. There were 1,329 itinerant elders in the United States and 68 more abroad. Sunday School enrollments were 355,111, as compared with 353,923 the year before.

The Evangelical group reported consistent increases in members for the past 20 years, averaging 9,673 per quadrennium, but during the latest the total was 15,061. Giving declined in 1934 to $4,002,228, from a figure of $6,613,133 for 1930. In 1946 it rose to $8,217,812. Sunday School enrollments had dropped by 28,000 in eight years, and 71,000 in the 20 years, the latest figure being 264,119. An upward trend, however, was indicated in the last year of the quadrennium. The church membership was 263,536 for North America. Contributions to general missions and benevolences were $945,148.

The sales of publications by the Evangelical group totaled $5,546,328 for the quadrennium. The quadrennial report of the missionary society showed a total income of $2,352,750, as compared with $1,416,801 in the previous quadrennium.

The new denomination started 1947 with all bishops of the old bodies retaining their office. Headquarters, on Jan. 1, 1947, were set up in the United Brethren Building in Dayton, O.

FRIENDS

More than 1,500 members of the Religious Society of Friends attended the biennial meeting of the Friends General Conference, Cape May, N. J., June 21-28. A foreign service budget of $6,000,000 was announced by the American Friends Service Committee, which had 480 workers and staff members. In Philadelphia, its head office was handling numerous requests for service, touching most of the areas in which it was carrying on foreign programs. These included inquiries as to missing relatives in Europe, welfare reports, and foreign service, which were all increased with the reopening of work in France following the end of hostilities. Close to 1,000,000 articles of clothing were shipped in 1945.

The committee placed new emphasis upon education for peace through 1945 and 1946, conducting work camps and service projects for young people, conferences, and institutes with many round table discussions. A number of round table groups met at Cape May, N. J., where problems included international relations, the Four Freedoms, race relations, and the specific projects of the American Friends Service Committee, including raising of funds, for foreign work. At home, the committee was hard at work providing vocational guidance to conscientious objectors as they were released from Civilian Public Service Camps. In 1945, it gave $62,000 for the support of 175 families of these men.

Social service was provided for 375 such families.

Its income from cash and gifts in kind for 1945 totaled $3,732,954, the gifts having an estimated value of $705,205, the remainder being cash. Expenditures, including materials received in kind for the committee's many programs, were $3,212,260. In a new budget, provision was made for $20,000 to use for temporary loans to conscientious objectors leaving civilian public service camps and seeking places in business, the professions, or farming. With the systematic release of these men, beginning in October, 1945, the Friends began appointing former CPS men for overseas posts and in administrative and field work of the committee in the United States. A liaison was established with British Quaker agencies through an interchange of administrative staff. The service committee initiated grants in aid for resuming formal education by released CPS men and half-scholarship assistance was added by Quaker colleges.

Another unit, started in 1943 as the Women's Service in Mental Hospitals, had acquired the services of 100 girls, and by the end of 1945 the name was changed to Institutional Service Units. The women served an average of five months as attendants, recreation and occupational therapy aides, clerks, secretaries, and nurses. Emphasis was given to problems in state institutions in 1946 and the need for such workers.

Toward the end of 1946 the committee announced plans to set up headquarters in Paris where contacts would be made with Quaker missions in European countries for consultation on impending relief.

LUTHERANS

Plans for restoration of the Lutheran World Convention, as the cooperative agency of Lutheran churches in 28 countries under a new identity as the Lutheran World Federation, were inaugurated in Upsala, Sweden, in July, 1946, continuing in office as president of the executive committee, Archbishop Erling Eidem, Primate of the State Lutheran Church of Sweden, and as executive secretary Dr. Sylvester C. Michelfelder. Both had been informally chosen for the posts at Copenhagen, Denmark, in December, 1945. A World Assembly was set for late June, 1947, at Lund, Sweden, to discuss all phases of denominational work. The plan was announced to have such assemblies every five years.

Delegates to the fifteenth biennial convention of the United Lutheran Church in America at Cleveland, O., in October, 1946, unanimously approved a new hymnal already endorsed by the Augustana Synod, the American Lutheran Church, and the United Evangelical Lutheran Church; endorsed the plan to reestablish the Lutheran World Convention as a federation, and reaffirmed support of the World Council of Churches and the Federal Council of the Churches of Christ in America. These steps were regarded as further progress toward Christian unity. Other contributions to the common effort were made by the Norwegian Lutheran Church of America, which, in June, 1946, changed its name to the Evangelical Lutheran Church in a specific move to open its membership to non-Norwegians, as well as to attract English-speaking members of Norwegian ancestry. In this, was followed the example of the former United Danish Evangelical Lutheran Church in America, which, in 1945, became the United Evangelical Lutheran Church.

The baptized membership of Lutheran churches in the United States and Canada rose to 5,522,307 during 1945, an increase of 117,516 over 1944, according to the annual statistical summary of the National Lutheran Council. Confirmed members totaled 3,877,657, an increase of 81,141. The rise in each classification was 2.1 per cent. There were 16,158 churches. The summary was based on data from 18 bodies, covering all Lutherans in America. Of these, seven had gains, four had losses in membership, one had no change, and six did not report latest figures. The highest increase was reported by the Missouri Lutheran Synod, which gained 29,456 members. The Augustana Synod had the greatest percentage increase, adding 19,791 and reaching 4.8 per cent. Other gains reported were: United Lutherans, 23.289; American, 17,075; Evangelical Lutheran, 27,405; United Evangelical Lutheran Church, 1,093; and the Negro Mission, with an increase of 549, or 4.5 per cent. Losses were confined to the smaller groups. The Finnish Suomi Synod showed a drop of 681 members to 29,875; the Norwegian Synod, a drop of 411, to 9,012; the Danish Lutheran Church of 40, to 19,428; and the Eilsen Synod of 10 to 1,380.

The number of ordained Lutheran ministers rose to 14,388, an increase of 435. Of these 10,600, or 384 more than the previous year were serving in pastorates. Seventy-one new churches were started. During the year, 819 parish schools were established, bringing the total to 24,129; their staffs were increased by 6,389 to 194,814 officers and teachers. They gained 61,087 pupils, the total being 1,974,014. The value of church property was increased by $21,891,788 to a high of $431,022,697. Indebtedness was reduced by a record $10,132,516 to a new low of $14.638.023. The churches devoted $73,357,078 to local expenses and contributed $30,889,713 to church work at large, the total expenditures of $104,246,791 being an increase of $16,117,903 over 1944.

METHODISTS

The major emphasis among Methodists in 1946 was evangelism. Eighty-two new missionaries were appointed to home and foreign fields. Reports from 40,498 preaching places disclosed, by Oct. 15, a total of 910,447 accessions to membership toward a goal of 1,000,000 for the year. Of these, 491,113 were received on confession of faith and 419,334 by transfer. The evangelistic goals had been reached by eight episcopal areas out of 33; 43 annual conferences out of 110, and 214 districts out of 560. Another goal for 1946 was the establishing of 500 new churches. The total result was the organizing of 728 new or re-established churches. Diminishing church school enrollments and attendance, noted the previous decade, was changed to a gain of 401,712 in 1946. In the wake of these achievements the denomination set out for 1947 to promote further gains with intensive preaching, study and conversation groups, special meetings, pageantry, and audio-visual aids. There were 18,298 active ministers at the start of 1946.

The latest available complete figures were those for 1945. They showed a total membership, active and inactive, of 8,083,767. The 1946 accessions, while applicable toward an increase in that figure, were withheld for the 1947 report when offsetting losses could be used to produce a true total. Church property as of the year 1945 was valued at $801,250,932, against which there was an indebtedness of $19,025,291. This had been reduced by $6,000,000. The amount of total income for all purposes in 1945 was $148,286,227, which included a substantial proportion of the special $25,000,000 fund raised in 1945 and 1946 for post-war relief and reconstruction. The fund was so named because of an original goal but the total as of Nov. 22, 1946 had reached $26,822,637. The Sunday School enrollment was 4,848,748. The Woman's Society of Christian Service, with 1,589,561 members, raised $8,399,273 for local causes and $4,295,963 for general work, including missions. World service receipts, or budgeted benevolences, 1945-46, were $6,284,285, surpassing the 1944-45 figure by 8.29 per cent. In addition, $767,614 was received by several agencies direct from donors. An additional $1,000,000 was raised and disbursed by the Committee for Overseas Relief, headed by Bishop Herbert Welch. A survey of the denomination's 560 district superintendents revealed plans to expend more than $100,000,000 in the next five years in building new churches and parsonages and for extensive property renovations and additions.

The Board of Missions and Church Extension meeting at Buck Hill Falls, Pa., in December, made appropriations also of $9,381,319 for missions at home and abroad. Of this, $3,371,393 was allocated to foreign fields and $2,010,475 to missions in the United States and its territories. The Woman's Division of Christian Service appropriated $3,999,451 for work at home and abroad. Its department of Christian Social Relations and Local Church Activities concurred in an action of the United Council of Church Women directed at meeting the problem of segregation of minorities, particularly of Negroes in Washington, D. C. They resolved to seek a wider use of the ballot by education, the abolishing of the poll tax and procuring of voting rights without intimidation or restriction. They voted to support pending legislation against lynching, for Federal aid to education, the Maternal and Child Welfare Act, and providing medical care for all people.

The Board of Missions and Church Extension wound up its meeting by calling for immediate evacuation of southern Korea by American troops and of northern Korea by Russian troops, "with the establishment simultaneously of a United Nations Plebiscite Commission, which would proceed at the earliest possible date to hold an election to provide for free, democratic government." The Board urged Methodists to take "an intelligent and active interest in the social, political, and economic interrelations of the Philippine Republic and the United States of America." The Foreign Missions Conference of North America was urged, through its Philippines committee, to continue to provide leaders to strengthen the Christian Church in those islands. The Board also called for adoption of the principles of brotherhood and justice in all negotiations between the two republics. The division of foreign missions, deploring the situation in Palestine, affirmed its appeal "that no economic or political Western interest should be allowed to influence any attempt towards a solution" of the conflict there. Regarding racial tensions in the United States, the board urged "our people in both South and North to take upon their hearts the urgent necessity for achieving a wider and deeper understanding of interracial amity and brotherhood." It recommended to President Truman, Secretary of State Byrnes, Warren R. Austin, and all United States Senators and Representatives, that they "give full cooperation to the early establishment of the Trusteeship Council of the United Nations" and "that territories in the Pacific occupied in the recent war be placed under the Trusteeship of the Council."

Bishop G. Bromley Oxnam of New York City, at an evening session in Buck Hill Falls, Pa., urged the setting up of democracy at home to end dictatorship abroad. He called for "fundamental revisions in our concepts of sovereignty" and "in our concepts of property" as steps to peace.

AFRICAN METHODIST EPISCOPAL ZION CHURCH

The 150th anniversary of the withdrawing of a group of Negroes from the Old John Street Methodist Episcopal Church in New York City to found a denomination of their own, was celebrated at Mother Zion Church, New York City, for two weeks, early in September, 1946, with 4,000 in the congregation the opening night to hear Bishop Buford F. Gordon of Charlotte, N. C. preach. He said Negro Methodism had grown because of a denial to them as "deserving Christians the right to exercise their talents." He called not for building race consciousness, but working out of an inter-racial consciousness. The denomination, numbering more than 500,000, had taken as a goal in 1944 the raising of $2,000,000 and the adding of 500,000 additional members to its ranks, in connection with a two-year preparation to celebrate the anniversary. Its communicants were found in all parts of North America, and in some areas of South America, Africa, and Southern islands.

PRESBYTERIAN CHURCH, U. S. A.

More than $6,500,000 was contributed in the first several months of 1946, to the Presbyterian Restoration Fund, a drive which was launched June 1, 1945 to run for at least two years. As of March 31, 1946, the communicants of the denomination numbered 2,174,530, the largest in the church's 240 years history in America. Total contributions of $67,219,476 were above the 1929 level by more than $100,000 and represented an all-time high. It was a rise of $7,610,461 from the previous year, when the total was $59,669,015. Per capita giving was $31.76 as compared with $28.32 the year before. Denominational and local expenses were $55,309.203.

The denomination has churches in every state in the Union, and its mission work is being carried on by 2,686 missionaries in 3,949 projects. There were 40 synods and 268 presbyteries, with 8,572 churches and 9,454 ministers. More than 200 of its clergymen were still serving in the armed forces as chaplains, in 1946. Its Board of Christian Education had expenses in the year ended March 31, 1946 of $1,010,238. A program of evangelism was approved by the 158th General Assembly of the denomination in late May, 1946, at Atlantic City, which started Jan. 1, 1947 with a goal of 1,000,000 new members, 300 new churches or Sunday Schools, and the help of 100,000 trained laymen in carrying it out. The number of foreign countries in which such work was being carried on had increased from 16 before the Second World War to 26.

Among resolutions adopted was one calling for "the immediate cessation of the manufacture of atomic bombs" and that "all uses of atomic energy for the health and welfare of people be available to all people." Full participation was urged in the United Nations. A total of $80,000 was reported raised from voluntary contributions toward an obligation of $125,000 to peace churches which had assumed responsibility for the care of conscientious objectors during the war. A move to appropriate the balance from denominational funds was defeated, but continued acceptance of voluntary offerings was authorized, to raise the remaining $45,000.

In October the former weekly *Presbyterian Church Times* was merged with the former monthly *Presbyterian Tribune,* creating a new national Presbyterian weekly. A magazine format was retained for one issue to be published the second Saturday in each month, in which essays, editorials, and articles began to appear, emphasizing lay viewpoints. The remaining issues were continued in newspaper format and style. Dr. Carlyle Adams, former chaplain at Park College, Parkville, Mo. became editor. The editorial office was moved from Utica, N. Y. to Cadman Memorial Center, Brooklyn.

PRESBYTERIAN CHURCH, U. S.

The Presbyterian Church in the U. S. or Southern Presbyterian Church, reported from its 1945-46 data, a total of 3,524 churches, 2,621 ministers, and a membership of 593,613. A total of 18,913 new members was received in 1946 on profession of faith and 28,482 on certificate. Contributions for current expenses totaled $6,576,406; for benevolences, $6,323,602; for pastor's salaries, $4,167,886; building expenses $4,119,475; a grand total of $21,187,369. This was a year's increase of $2,663,186. Per capita giving was $36.04.

The 86th General Assembly met in Montreat, N. C., in late May, 1946. Overtures seeking withdrawal from the Federal Council of the Churches of Christ in America were defeated. The committee on stewardship was instructed to place the Council in the future in the denominational budget. A permanent committee on war relief was granted $250,000 for 1946-47. The permanent committee on cooperation and union was authorized to inquire as to possibility of simultaneous meetings of the General Assembly of Southern churches and the General

Assembly of the Presbyterian Church in the U. S. A., looking toward ultimate union. Representatives of agencies of the two groups met in Atlanta, Ga., in December, with a drafting committee to study proposals for reconstruction and consolidation of their respective boards. The Southern group set a goal of 500 new chapels or outpost Sunday Schools for 1946-47. A committee on Negro work was set up. Sunday School enrollment from latest figures was 423,012, with 652 outposts.

REFORMED CHURCH IN AMERICA

The 140th regular session of the General Synod was held at Buck Hill Falls, Pa., May 23-28. The denomination had 743 congregations with 176,167 members. A total of $7,023,225 was raised for all purposes, an increase of more than $1,000,000 over the year before. Average contribution per capita was $40. Receipts of the Board of Education were $321,565 from living donors and $29,839 from investments. This was the highest record in 118 years. The Board of Foreign Missions and the Woman's Board of Foreign Missions were merged on May 1, 1946, the latter having served as an auxiliary for 71 years. The new board had 27 men and 15 women. Contributions from living donors were increased over the previous year by $66,557. The committee on church union was instructed to draft a plan of union to be entered into with the United Presbyterian Church, to be ready for action March 1, 1947. The latter denomination took the plan under consideration in 1945, and by 1946-47 the two denominations had begun to work out exchanges of pulpits in local communities and exchanges of lecturers in their colleges and seminaries. Conferences of churchmen from both groups were being planned and carried out also.

SALVATION ARMY

General Albert Orsborn, sixth international General of the Salvation Army, who succeeded General George L. Carpenter upon his retirement in June, 1946, arrived in the United States in September, from London, for conferences the next three months with Salvation Army officers. The army's slogan "Marching Forward to a Better World" was being implemented in local communities throughout the country. The organization had 3,000 units of activity, for the most part in urban areas of the United States. These included hospitals, young women's residences, men's and women's emergency homes and lodges, hotels for men and for women, detention homes, social service centers, boys' clubs and youth centers, fresh-air and young people's camps, settlements and day nurseries, a missing persons bureau, vocational guidance and placement bureaus, service centers for armed services personnel, transient service bureaus, leagues of mercy composed of volunteers organized to visit the sick in hospitals and homes, leagues of laywomen working to improve home life, prison and police court work, and rural service units. General Orsborn spoke at a luncheon at the Hotel Waldorf-Astoria in New York City, with a radio broadcast, his first public address. The Salvation Army in the United States was busy in a nationwide project to promote aid of 500,000,000 starving people in war-torn countries, inviting relief packages for shipment and distribution under the Army's supervision. Up until Fall more than 4,100 packages, totaling 20 tons, were received and sent.

CHRISTIAN SCIENCE

The post-war activities of the Christian Science Church consisted chiefly in supplying workers for Veterans' Administration Hospitals in the United States and Canada and in serving military and naval personnel at training camps in the United States; also in serving occupation troops in the European and Pacific theaters. Their activities included rehabilitation work and the collecting and sending of food packages to churches and individuals in countries where needed. The Christian Science Publishing Society added a Spanish edition of the *Herald of Christian Science* to its group in French, German, Scandinavian, and Braille. The correspondents of the *Christian Science Monitor,* a daily publication of the Society, returned to Moscow and Rome in 1946. The board of directors of the Christian Science Church, in their report at the annual meeting in Boston in June, 1946 discussing church and government, stated: "It must be admitted that in working out the destiny of the race, the State and the Church have a common responsibility. It is their inescapable duty to promote unity, moral integrity and economic stability among people and nations. It is likewise their duty to cooperate in the promotion of such essentials to free government as private enterprise, individual liberty, and freedom of religious worship. These responsibilities, however, can be discharged successfully only in the degree that these two distinctly different agencies function independently of each other."

THE ROMAN CATHOLIC CHURCH

By John Gilchrist
National Catholic Welfare Conference

STATISTICS

Membership in the Catholic Church in the United States in 1946 totaled 24,402,124, according to figures given by the *Official Catholic Directory.* A record total of 18,667 Catholic parishes were in operation, with 13,667 of them having resident pastors. There were, in addition, 5,124 chapels and 5,084 mission churches.

There were 166 members of the American Hierarchy presiding over 101 dioceses and 22 archdioceses. These also include, for statistical purposes as American dioceses, the Vicariate-Apostolic of Alaska, Honolulu, Hawaii, the Abbatia Nullius of Belmont Abbey, N. C., as well as the Pittsburgh (Greek Rite) and the Ukrainian Greek Catholic Diocese.

The number of ordained clergymen is 38,980, the highest on record. There are 25,567 diocesan priests and 13,060 religious order priests. Among professed religious, the number of Sisters has increased to 139,218 and the number of Brothers to 6,721.

Elementary parish school pupils have increased by 41,190 to 2,070,202. Parish high school enrollments are 301,339, an increase of 22,720 over 1945. The number of seminarians has increased by 1,427 to 22,950. A total of 87,430 converts entered the Church during the year. Infant baptisms numbered 792,987, and the total number of deaths was 256,433, a decrease of 8,314.

The total number of American youths under Catholic instruction was 3,451,735, an increase of 245,931. One hundred and ten new institutions bring the total of Catholic general hospitals to 794, with a total bed capacity of 86,919. The number of patients treated annually in general hospitals totals 3,339,239, an increase of 48,418 over 1945 figures, and those treated in special hospitals and sanatoria, 58,687.

There are 45,219 children in 365 Catholic orphanages and infant asylums, and 19,308 children in foster homes.

BISHOPS' WAR EMERGENCY AND RELIEF COMMITTEE

The Bishops' War Emergency and Relief Committee was organized in 1940 as a centralized agency to meet war emergencies as well as relief needs of people suffering the devastation of war. A total of $2,500,000, raised in Catholic Churches throughout the United States, and distributed mainly through the Vatican on the basis of greatest need, continued to provide general relief to war victims, prisoners, refugees, and the homeless. Allotments were made to help relieve suffering and distressed victims of war, men, women, and children, from Poland, China, Belgium, France, Holland, the Scandinavian and Baltic countries, Greece, and a dozen other war-torn lands. Aid was given to refugees here and abroad through the Catholic Refugee Committee in New York.

Grants were also given toward the maintenance of Montezuma Seminary located near Las Vegas, N. M., where Mexican candidates for the priesthood are being educated.

WAR RELIEF SERVICES—NCWC

War Relief Services-National Catholic Welfare Conference administers a program of relief and assistance to refugees, victims of war, prisoners of war, and merchant seamen in the United States and in more than 40 foreign countries. This agency has accomplished a vast work of mobilizing Catholic efforts on behalf of the war-stricken, as well as the actual task of distribution of relief since the beginning of operations, Aug. 1, 1943. Records show that nine campaigns conducted by War Relief Services-NCWC from that date to May 1946, enabled the organization to administer over $70,000,000 worth of relief goods. Efforts were redoubled during 1946, in response to a plea of Pope Pius XII that the entire Catholic world mobilize to save Europe's war-stricken, especially the young.

In May, again in response to a plea from the Vatican to combat famine in war-ravished lands without discrimination, a "Food for Children of Europe and the Far East" campaign was conducted in 15,000 Catholic parishes throughout the United States. This drive resulted in the collection of 30,000,000 cans of food, 10,000,000 in excess of the original goal. More than 8,900,000 pounds of this collection were shipped to 12 countries in Europe and the Far East during a six-week period ended in July, and 1,200,000 pounds of canned foods were dispatched later to Poland, Greece, and Italy, countries where destitution was reported to be most widespread.

Relief channels to Germany were opened early in the year by authorization of President Truman, and War Relief Services arranged to supply one shipment a month, each consisting of 2,000 tons of food, clothing, and medical supplies for needy German civilians. Relief for Austria was also inaugurated with the shipment of 1,028,987 pounds of supplies. To aid India's starving millions, War Relief Services expedited the shipment of 1,000,000 pounds of flour.

Supplies in the amount of 3,900,000 pounds were reported en route to Germany in July 1946, and in the following month, War Relief Services announced the assignment of 250,000 pounds of whole wheat flour for the relief of people in North Africa. By October, more than 6,000,000 pounds of goods in all had been consigned to Germany, for distribution in the American, British, and French zones.

A nationwide campaign was launched in October 1946 for a minimum of $5,000,000 to carry on foreign relief work as well as the allied activities of the Bishops' War Emergency and Relief Committee. A "Clothe the War Stricken" campaign was held during December in 25 dioceses in areas most readily accessible to New York and San Francisco warehouses of War Relief Services.

The generosity of American Catholics toward the unfortunate in other parts of the world has also been indicated by many special contributions from Catholic groups, for the extension of the foreign relief work of War Relief Services. Among these were a gift of $60,000 from the St. Vincent de Paul Society, a charitable organization of Catholic men, and $10,000 from American Slovak Catholics.

Countless expressions of gratitude have been received from many countries, including Hungary and Belgium, and special thanksgiving services for supplies received were reported held in Holland and Luxembourg.

During the fiscal year October 1945–September 30, 1946, relief shipments weighing 55,187,224 pounds and valued at $15,325,388.13 were made. At that time, War Relief Services-NCWC had made 678 shipments to 36 countries, a total of 71,231,855 pounds, with a value of $21,963,051.

THE NATIONAL CATHOLIC COMMUNITY SERVICE

The National Catholic Community Service, Catholic agency of the United Service Organizations, planned to continue through 1947 its program of spiritual, recreational, and educational services to those in the armed forces. In five years of wartime activity, 700,000 NCCS volunteers served 250,000,000 men and women in uniform, war workers and their families in 500 clubs under NCCS direction. In response to community needs and demands, the National Catholic Community Service planned permanent establishments, emphasizing service to veterans and to youth and adult programs. During 1946, the services of NCCS were made available to patients of Veterans Administration hospitals and visiting members of their families.

DECLARATIONS OF THE AMERICAN HIERARCHY

On Nov. 13, 1946, 124 members of the Hierarchy in the United States assembled at the Catholic University in Washington, D. C., for the 1946 general meeting and continued in session for three days. At the close of the meeting, the Bishops issued a statement entitled "Man and the Peace," which was signed in their names by the Administrative Board of the National Catholic Welfare Conference.

The statement called upon nations and leaders to secure men everywhere in the enjoyment of their native rights. Stressing that the basic problem of man, his nature and rights, underlies all problems today, the statement warned that, unless those who bear the responsibility of world leadership are in basic agreement on what man is, confusion and conflict will continue to block the road to real peace. Respect for the rights and duties of man as an individual and as a member of civic and domestic society was held to be the first obligation of any government to its citizens. What a government can not do in the exercise of its own sovereignty, the Bishops stated, it can not approve or abet on the part of another government.

Concerning the conflict between Russia and the West, the document stated that the aftermath of war has revealed that Soviet totalitarianism does not acknowledge and respect basic human freedoms. The statement also contained pleas for the repatriation of prisoners of war, the humane treatment of displaced persons and refugees from persecution, and condemnations of the ruthless transplanting of peoples of Eastern Europe and of the deportation of thousands in areas of Soviet aggression to remote regions.

The statement concluded with a prayer for the peacemakers, begging Almighty God for forgiveness for past transgressions, and asking light and strength for those who must make the decisions in peace conferences.

The Bishops' Meeting also reviewed reports of the various departments and elected members to the Administrative Board of the National Catholic Welfare Conference, as well as to the Episcopal Committees on the American Board of Catholic Missions, the Society for the Propagation of the Faith, the Confraternity of Christian Doctrine, the National Organization for Decent Literature, the North American College (Rome, Italy) and Motion Pictures.

NEW NCWC BOARD MEMBERS

New members elected to the NCWC Board were the Most Rev. Archbishops James H. Ryan of Omaha, Robert E. Lucey of San Antonio, and Bishops William D. O'Brien, Auxiliary Bishop of Chicago, and Michael J. Ready, Bishop of Columbus. Other members re-elected included the Most Rev. Archbishops John Gregory Murray of St. Paul, Joseph F. Rummel of New Orleans, John J. Mitty of San Francisco, Richard J. Cushing of Boston, and the Most Rev. Bishops Karl J. Alter of

Toledo and John Mark Gannon of Erie.

At the meeting of the newly elected Administrative Board, following the general sessions, the Most Rev. John T. McNicholas, O.P., Archbishop of Cincinnati, was elected chairman of the NCWC Administrative Board.

CATHOLIC EDUCATION PROJECTS

The activities of the NCWC Department of Education, attained international scope with the formation of the Catholic Commission on Intellectual and Cultural Affairs, participation in the U. S. Educational Mission to Japan, and membership in the United Nations Educational, Scientific, and Cultural Organization. Other projects occupying the attention of the Department during the year included Federal Aid to Education, the National School Lunch Act, the G.I. Bill of Rights, and housing for veteran students.

A medal for the outstanding services of Catholic schools in the sale of war bonds and stamps was presented to the Education Department by the War Savings Division of the United States Treasury Department.

Two Catholic educational leaders were among 30 persons named to the Presidential Commission on Higher Education, whose purpose it was to re-examine the American system of higher education in terms of its objectives, methods, and facilities, and in the light of the social role it must play.

The National Catholic Educational Association and the National Catholic Welfare Conference were among 50 national organizations invited to name representatives to serve on the national committee to advise the State Department on matters relating to the UN Educational, Scientific, and Cultural Organization.

THE CATHOLIC PRESS

The Catholic Press showed a total circulation of 10,654,918, a gain of 1,500,000 in three years. Social projects of Catholic news coverage included the consistories at Rome in February 1946, the work of special foreign correspondents, syndicated material, and the inauguration of more popular features. A recently undertaken program of expansion showed promising results. Seven new Catholic publications were launched during the year. Publications in 34 countries now subscribe to the NCWC News Service, while Noticias Catolicas, the Spanish-language news service, serves over 60 papers in 18 countries.

SOCIAL ACTION

The establishment of the UN and the problem of atomic energy placed new projects before the NCWC Social Action Department, which worked for representation of non-governmental organizations with the United Nations, was represented at several international meetings, and assisted in the organization of the National Committee on Atomic Information.

This Department also arranged four industrial conferences, held preliminary meetings relative to the establishment of a committee on Negro problems, and expanded the work of the Family Life Bureau which held its annual conference at the Catholic University of America in Washington, D. C., Feb. 5-8.

In a special "Labor Day Statement," the first of its kind to be issued by the Social Action Department, an early national meeting of freely chosen representatives of organized labor, management, agriculture, and the professions was advocated, to discuss establishment of an occupational group system for organized cooperation for the general economic welfare.

Under the joint auspices of the National Committee of Cuban Social Action and the NCWC Social Action Department, the Second Inter-American Seminar of Social Studies was held in Havana, Jan. 2-10, 1946. Observers from Spain, France, Portugal, The Netherlands, Great Britain, as well as from the International Labor Office, attended. Eighty-seven delegates from 24 nations and colonies of the Western Hemisphere exchanged ideas and experiences. The general theme—Catholic Social Action in the

Americas—was considered under the aspects of agriculture, industry, labor movements, and race relations. Discrimination on the basis of race and color was condemned, Catholic social doctrines reaffirmed, and the principle of an Inter-American Office of Catholic Social Action was approved.

LAY ORGANIZATIONS' PROGRESS

The National Council of Catholic Men was represented by councils in 26 dioceses. The year was marked by the vigorous growth of Catholic radio work. "Faith in Our Time," the third nationwide radio program under NCCM sponsorship, was inaugurated. The work of the National Organization for Decent Literature continued to be effective.

CATHOLIC WOMEN'S ORGANIZATIONS

The National Council of Catholic Women, a union of Catholic women of the United States instituted 26 years ago, now comprises 4,598 affiliated organizations on the national, state, diocesan, and local levels. Its 1946 program continued to emphasize the development of Religious Discussion Club leaders, the sponsorship of marriage forums, Catholic libraries, retreats, and diocesan family life programs. The 23rd Convention of the National Council of Catholic Women, held in Kansas City, condemned Communism and stressed the position of women in a truly Christian society.

THE CONFRATERNITY OF CHRISTIAN DOCTRINE

In 1946, the Confraternity of Christian Doctrine was officially established in 21 archdioceses and 91 dioceses. Seventy prelates and 50,000 other persons from all parts of the world attended the eighth and the greatest Confraternity of Christian Doctrine Congress, held in Boston in October. The delegates were addressed by radio by Pope Pius XII. Renewed emphasis on confraternity work was placed on the teaching of religion to uninstructed adults, children, and youth. More than 500,000 prayer leaflets were distributed for the promotion of religious instruction.

THE CONSISTORY AND NEW CARDINALS

One of history's most notable events took place when four United States Cardinals-Designate flew the Atlantic to the Consistories at Rome, where, at brilliant and solemn ceremonies which attracted worldwide interest and attention, 28 new Cardinals received the Red Hat, emblem of their office, from Pope Pius XII. The newly appointed American Cardinals were Archbishops John J. Glennon of St. Louis, Edward Mooney of Detroit, Samuel A. Stritch of Chicago, and Francis J. Spellman of New York. Not long after, while public receptions and solemn religious rites marked the homecoming of the prelates, the country was saddened by the death of Cardinal Glennon, in Ireland, while en route home. The first Chinese Cardinal, Thomas Tien, also toured the United States during the year, and Cardinal Bernard Griffin became the first British Cardinal to visit this nation when he arrived to receive, with President Harry S. Truman, an honorary doctorate at Fordham University's centennial celebration.

CANONIZATION OF MOTHER CABRINI

Of particular interest to Catholics of the United States were the canonization ceremonies of Mother Frances Xavier Cabrini, July 7, the first United States citizen so honored. Thirty thousand persons were present in the Basilica of St. Peter's in Rome when Pope Pius XII solemnly proclaimed the foundress of the Order of Missionary Sisters of the Sacred Heart a Saint.

OTHER EVENTS

An event unprecedented in American history took place during the year when the Rev. Daniel Ivancho, pastor of St. Mary's Greek Rite Church, Cleveland, was consecrated a Bishop, to be Coadjutor to Bishop Basil Takach of the Pittsburgh Greek

Rite Diocese. This was the first time a Bishop of the Greek Rite had been consecrated in this country.

Two American Bishops, the Most Rev. John F. O'Hara, C.S.C. of Buffalo, N. Y. and the Most Rev. Michael J. Ready of Columbus, made a 19-day visit to Japan at the invitation of the Japanese Hierarchy, and with the approval of General Douglas MacArthur, and the War and Navy Departments. Received by General MacArthur and Emperor Hirohito, the Bishops visited ten cities and spoke to hundreds, particularly with reference to post-war problems of reconstruction and the development of missionary personnel. The Most Rev. Joseph P. Hurley, Bishop of St. Augustine (Fla.), appointed regent *ad interim* at the Apostolic Nunciature of Yugoslavia, arrived in Belgrade, and the Most Rev. Aloisius S. Muench, Bishop of Fargo, N. D., was named official representative to serve as liaison between the Church and U. S. Military Government in the American zone in Germany.

The NCWC Youth Department was represented among delegates of youth organizations of the country who met with President Truman to discuss plans for cooperation in easing world famine. The NCWC Bureau of Immigration reported completion of arrangements for representatives to meet several large groups of displaced persons scheduled to arrive in harbor. In cooperation with other national social agencies, the National Catholic Welfare Conference workers were ready to aid immigrants through customs and other procedure before turning Catholic DP's over to the Catholic Committee for Refugees for further care and placement. One hundred and eighty-five Polish war orphans arrived from Mexico for placement in orphanages in several cities.

Compilation of war records shows notable service on the part of Catholics, both in the armed forces and in civilian industries in the Second World War. The first chaplain in the nation's history to receive the country's highest honor, Father Joseph T. O'Callaghan, S.J., of the Navy, received the Congressional Medal of Honor from President Harry S. Truman.

THE EASTERN CHURCHES

By E. R. Hardy, Jr.
Berkeley Divinity School

GREEK (HELLENIC) ORTHODOX CHURCH

The biennial Convention of the Greek Orthodox Church was held in Boston Nov. 3-7. The Convention was marked by a desire to advance the activities of the Church in view of the needs of American life as well as in an Orthodox spirit. An important step forward was the purchase of an estate at Brookline, announced at the Convention, to which the upper classes of the Seminary have been moved from Pomfret, Conn., and where the residence of Bishop Athenagoras of Boston has been established. This is intended to be the beginning of an Orthodox School of Theology and other higher studies at Boston.

Other plans launched at this Convention were the formation of a Missionary Society and the revival of the ancient Order of Deaconesses, which existed at Constantinople even in the Middle Ages. The Convention passed a resolution in favor of permitting the marriage or remarriage of the clergy after ordination; Orthodox custom has for a long time allowed the clergy to be married, but only if married before they are ordained. Since the Greek Church in America is under the jurisdiction of the Patriarch of Constantinople, this resolution has been forwarded to him for such action as he may feel able to take. The Syrian

Metropolitan and the Ukrainian Bishops were present at the Convention; its opening Liturgy was held in the Boston Arena, no Greek Church in Boston being adequate for it. Archbishop Athenagoras in his address stressed the importance of English-speaking clergy for this country.

A certain number of clergy are now coming from Greece for the service of the Church in America. Under arrangements made by Prof. Alivisatos of Athens, in cooperation with the World Council of Churches, 15 students from Greece are now studying in American theological schools (mainly of the Episcopal and Methodist Churches) in preparation for further service to the Church of Greece.

RUSSIAN ORTHODOX CHURCH

The negotiations between the Russian Church in America and the Mother Church in Russia have continued to command much interest outside as well as within the Russian Church. Archbishop Alexei of Rostov, having failed to arrive at an agreement with the American Bishops, left for Russia early in March, 1946. Two Bishops have come over to the Patriarchal Church, represented in America by Metropolitan Benjamin–Alexei, formerly of Alaska, who has returned to Russia, and Makary of Brooklyn, now at the old Russian Cathedral in New York, which from 1923-1945 was in the hands of the dissident "Living Church" group. The Carpatho-Russian parishes under Archbishop Adam are also attached to the Moscow jurisdiction.

The greater number of Russian parishes in America, however, remain with the provisionally autonomous jurisdiction of Metropolitan Theophilus. A Sobor of clergy and lay delegates was held at Cleveland, Nov. 27-29. This gave the general body of the Russian Church its first opportunity for formal expression on the issue of relations with the Church in Russia. After much discussion, a resolution was passed expressing a desire to remain spiritually connected with the Patriarchate of Moscow, but without administrative subordination. The Sobor also voted to break all administrative connection with the Synod of Russian Bishops in Exile (formerly at Karlovtsi in Jugoslavia and now at Munich and Geneva), with which the American Church has been affiliated since 1936.

The influence of the younger, English-speaking generation was conspicuous at this Sobor; it was marked by the conduct of proceedings partly in English and by the approval of the minutes in English as well as Russian. The younger clergy now being trained at St. Vladimir's Seminary, New York, are generally sympathetic to this group; it is being planned to expand and improve the work of St. Vladimir's and to turn the "Pastors' School" at St. Tikhon's Monastery, South Canaan, Pa., into a school for choir directors. The Federation of Russian Orthodox Clubs (young people's societies) held its first postwar convention at Pittsburgh in September.

Metropolitan Theophilus has consecrated Archimandrite John Zlobin, long priest of the old Cathedral at Sitka, to the See of Alaska, which has been vacant for some time. Bishop John has returned to Alaska, and is making plans for the training of catechists in view of the many vacant churches in that diocese. An interesting group that arrived in America in the fall are the Brothers of St. Job, a monastic fraternity devoted to the printing of liturgical books in Church Slavonic. For the last 20 years their work has been carried on in Slovakia; they are now resuming it at the Russian Monastery at Jordanville, N. Y.

OTHER ORTHODOX CHURCHES

On June 2, Bishop Nicholai of Zicha and Ochrid dedicated a chapel in the Serbian Orthodox Cathedral in New York in memory of Prof. Michael Pupin, the distinguished Serbian-American physicist of Columbia University. On June 9, Bishop Nicholai preached in Calvary Church, Pittsburgh, Pa., at a Vesper service under the auspices of the Orthodox and

Anglican Fellowship, Bishop Benjamin of Pittsburgh presiding. The Serbian Church has enlarged the facilities of its summer camp at St. Sava's Monastery, Libertyville, Ill., and is taking an active part in Serbian War Relief, especially for displaced persons of Serbian Orthodox faith.

The Rumanian and Bulgarian Churches are once more in touch with their Mother Churches. Bishop Andrei of the Bulgarian Church, who now holds the title of Bishop of North and South America and Australia, has now established his headquarters at Holy Trinity Bulgarian Cathedral, Madison, Ill. The Rumanian Synod expects to send an official visitor to the Rumanian Church in America, possibly Bishop Policarp, formerly in this country.

The activities of the Carpatho-Russian Church under Bishop Orestes, whose Cathedral is at Bridgeport, Conn., include a seminary and a school for choir leaders.

ORTHODOX CHURCHES ABROAD

In February 1946, Maximos V succeeded the late Patriarch Benjamin as Patriarch of Constantinople. Much was hoped from this relatively young and vigorous prelate, Bishop for the last 15 years of the Diocese of Chalcedon. Unfortunately it was reported at the end of the year that serious illness may require his resignation.

The Patriarchate of Moscow has continued to expand its activities. There are now 67 Bishops in Russia, several theological academies are in operation, and a number of parish churches and some monasteries have been reopened. The Moscow Academy has returned to its old quarters in the Monastery of St. Sergius near Moscow. The Patriarchate maintains its contacts by the exchange of visits with other Orthodox Churches; Patriarch Nicodim of Rumania has visited Patriarch Alexei in Moscow, and Metropolitan Gregory of Leningrad has visited Jerusalem. After the death of Metropolitan Eulogius of Western Europe on Aug. 9 the Patriarch appointed Archbishop Seraphim, formerly connected with the Karlovtsi Synod, as his successor. Most of the Russian clergy and parishes in Western Europe, however, considered this an unwarranted decision, and preferred in a diocesan conference of Oct. 16-20 to retain their connection with the Patriarchate of Constantinople. Most of the Russian Churches in China and Manchuria have returned to the jurisdiction of Moscow. Bishop Benjamin of Pittsburgh has gone to visit the Orthodox Church of Japan, in origin a Russian Mission, and may stay there as Bishop.

The Orthodox Churches of the Balkans continue closely bound up with the political situation. On the return of King George II of Greece, Archbishop Damaskinos retired from the responsible post of Regent. Patriarch Gavrilo has returned to Serbia, where the present Yugoslav regime hopes to model its church policy on that now prevailing in Russia. In Bulgaria, the Fatherland Front government has recognized the importance of the Church as a national institution; much was made in June of the celebration of the thousandth anniversary of St. John of Rila, founder of a famous Bulgarian monastery.

OTHER EASTERN CHURCHES

Bishop Tiran of the Armenian Church has been prominent in the cultural activities of American Armenians, and in the program for the return of Armenian displaced persons to Armenia. He is now bringing Armenian theological students from the Near East to this country for the service of his parishes.

Mar Shimun XXIII, Patriarch of the Assyrians, now residing in Chicago, is making arrangements for the consecration of additional Bishops for his Church, for which purpose he hopes to be allowed to visit Syria.

The Coptic Church (not represented in the United States) has elected a new Patriarch, Amba Yousab. The Abyssinian Church has been allowed representation in the Coptic Synod, but desires a greater measure of local autonomy.

JUDAISM AND JEWISH COMMUNAL AFFAIRS

By Harry Schneiderman
Editor, *American Jewish Year Book*

GENERAL

In 1946, the American Jewish community was concerned with solving the problems of Europe's homeless Jews. This problem became closely linked with the problem of Palestine. The outstanding feature in the political sphere, therefore, was the report of the Anglo-American Committee of Inquiry on Palestine. Among its recommendations, none of which had been implemented by the end of 1946, two created most interest and discussion. These were the proposals for immediate transfer to Palestine of 100,000 displaced persons, with simultaneous provision by other governments for absorption of the remaining displaced persons and for abolition of the land-purchase limitations instituted in the White Paper of 1939.

Together with the widespread distress in European countries, the failure to carry out the Anglo-American Committee's recommendations compelled American Jews to intensify their overseas relief activities. In addition to meeting this pressing obligation, American Jews increased their religious and cultural activities and, at the same time, vigorously reasserted their civic rights threatened by a postwar resurgence of numerous un-American groups.

UNITED STATES GOVERNMENT ACTION ON PALESTINE

In 1946, President Truman continued his efforts to reopen the doors of Palestine for the displaced Jews of Europe. Late in 1945, those efforts had resulted in the establishment of the Anglo-American Committee of Inquiry. At its hearings in Washington, D. C., in January, 1946, the Committee heard testimony urging the repatriation of displaced persons in Palestine. Advocates of this action included Earl J. Harrison, American representative to the Intergovernmental Committee for Refugees who had studied the situation in Europe, and Dr. Joseph Schwartz, European director of the American Jewish Joint Distribution Committee. The official Zionist case was presented by Rabbi Stephen S. Wise, chairman of the American Zionist Emergency Council, Dr. Emanuel Neumann, vice-president of the Zionist Organization of America, and others. Among the other Jewish agencies asked to testify were the American Jewish Committee, whose president, Joseph M. Proskauer, pleaded for the abrogation of the British White Paper on Palestine and for the admission of 100,000 Jews; and the American Council for Judaism, the only Jewish organization which opposed both the creation of a Jewish State and large-scale Jewish immigration as solutions to the problem.

After subsequent hearings in London and Palestine, the Committee of Inquiry issued a 40,000-word report April 26, 1946. Analyzing the position of the Jews in various European countries and discussing the causes of political strife in Palestine, the report denounced the White Paper of 1939. It recommended the speedy admission of 100,000 Jews to Palestine as well as the acceptance of additional refugees by other countries. The Committee expressed the opinion that the mutual hostility of Jews and Arabs rendered an immediate grant of independence impossible. However, it advocated the ultimate creation of a binational state, with safeguards against the domination of either side by the other. In the meantime, the Committee suggested that, pending the early establishment of a United Nations trusteeship, Great Britain's mandate over Palestine be continued.

While the Committee's recommendation to abrogate the restriction on immigration and land purchase met with almost unanimous approval in the United States, Zionist groups took strong exception to the rejection of the idea of a Jewish State. On May 20, the British and American governments invited the Jews and Arabs to submit their views on the Committee's report.

The American Jewish Conference and the American Zionist Emergency Council declined the State Department's invitation to submit comments on the ground that discussions would serve only to delay the transfer of displaced Jews to Palestine. On June 6, in the United States Senate, 11 members criticized the failure of the British and American governments to effect the immediate admittance of 100,000 Jews. Appeals to hasten their transfer also came from the American Jewish Committee, the American Jewish Conference, and the Zionist Emergency Council. To help solve the problem, President Truman appointed a committee, composed of the Secretaries of State, Treasury, and War, to negotiate with British cabinet members on the implementation of the report of the Anglo-American Committee of Inquiry.

Another storm of protest arose in America in July when the British cabinet committee suggested federalization of Palestine. Members of Congress condemned the plan, and Judge Joseph C. Hutcheson, American chairman of the Anglo-American Committee of Inquiry, described it as a "complete sell out," and a violation of the British Mandate. Jewish organizations joined in the strong protest and again asked for the transfer of 100,000 Jews to Palestine.

In October, President Truman sent a new appeal to Great Britain asking immediate substantial immigration of Jews without awaiting settlement of the future status of Palestine. He also urged the acceptance by Great Britain of a compromise between the cabinet committee's proposal and the Jewish Agency's plan to divide Palestine into Jewish and Arab states. The President pledged that the American Government would transport Jews from Europe to Palestine and might grant economic assistance to that country if "a workable solution" were devised. The plan was flatly rejected by the British Foreign Office which declared that no immigrants would be admitted into Palestine until its "whole political future" was settled. King Ibn Saud of Saudi Arabia termed President Truman's suggestions "inconsistent" with previous pledges by the United States Government. In reply, the President stated that this country always has supported and continued to support the establishment of a National Home in Palestine for the Jewish people.

Still more active diplomatic participation by the United States in finding a solution to the Palestine problem was indicated by the transfer of the matter from the White House to the State Department. A staff of experts was assigned to assist Secretary of State Byrnes in preparing for detailed discussions with British Foreign Minister Bevin. One result of these discussions was the American Government's decision to send an official observer to the British-sponsored Palestine Conference of Jewish and Arab leaders in London in January, 1947.

ZIONIST ACTIVITIES

Action taken by the American Zionists during 1946 revolved about the Anglo-American Committee's recommendations and subsequent British proposals which sought to defeat Zionist aspirations in Palestine.

At the 49th Annual Convention of the Zionist Organization of America, (ZOA), in Atlantic City at the end of October, its president, Dr. Abba Hillel Silver, launched a scathing attack upon Great Britain, condemning the partition plan and calling for resistance against the "illegal power" which keeps immigrants out of Palestine.

The convention adopted a number of resolutions which rejected proposals for the partition of Palestine; demanded the establishment of a Jewish state; asked that the Jewish Agency, which had committed itself on a partition plan for Palestine, submit any future proposals of this kind to the World Zionist Congress for approval; and urged that there be no participation of Jews in the January 1947 London conference on Palestine which it described as a "dilatory device" invented by the British Government to "deflect public criticism" of its Palestine policy.

A second set of resolutions called for the immediate creation of "an authoritative overall body" to conduct the "political effort on behalf of Zionism in the United States" and which was to be constituted "with due regard for both the interest of the Jewish Agency and the vital and indispensable role which must be played by the American Zionist Organization." The convention expressed appreciation to the President, Congress, and the people of the United States, for their support of Zionism and their advocacy of the admission of refugees to Palestine.

Hadassah, the women's Zionist organization, outlined a plan for immigrant health service in Palestine, including hospitalization of all sick newcomers, convalescent care, a special tuberculosis prevention and cure program, and enlarged child welfare activities. During 1946, this organization, with a membership of 200,000, collected nearly $5,800,000, all of which was sent to Palestine.

The attitude of American Jews toward Zionism was reflected in a Gallup poll, released in January, 1946. It showed that 80 per cent of all Jews in the United States, who followed the discussion about the fate of the Holy Land, favored the establishment of some form of a Jewish commonwealth; that 10 per cent were opposed to it, and that 10 per cent did not express any opinion on the matter.

OVERSEAS RELIEF

Faced with the challenge of assisting in the physical maintenance and spiritual survival of the 1,400,000 Jews of Europe (outside the Soviet Union), the Jewish community of the United States set for itself the record goal of raising $100,000,000 for the United Jewish Appeal for Refugees, Overseas Needs and Palestine in 1946. The goal was oversubscribed by about $3,000,000, and the total was divided as follows: the Joint Distribution Committee, $58,350,000; the United Palestine Appeal, $43,872,000; and the United Service for New Americans (incorporating National Refugee Service), $1,082,025.

In the meantime, however, the task of aiding Europe's Jews had increased in complexity and expense. As a result, the UJA conference, in December 1946, embarked upon one of the most ambitious fund-raising efforts for a humanitarian purpose in the history of the country. The quota set for 1947 was $170,000,000.

JOINT DISTRIBUTION COMMITTEE

The initial task of rescue and emergency relief undertaken by the JDC during and immediately after the war has been broadened to include the reconstruction and resettlement of Europe's Jewry. Its duties now include a program of economic rehabilitation, vocational training, communal reconstruction, educational and cultural activities, and assistance to those wishing to emigrate.

The scope of the JDC activities in the various countries differed according to specific requirements. Whereas in Eastern Europe, for example, expenditures were limited to providing the bare necessities of life, in countries such as Belgium and Italy, where local relief agencies or UNRRA housed and clothed the Jews, funds could be used for religious, educational, or other programs. JDC's migratory service extended to financing thousands of displaced persons who went to Palestine and assisting several hundred who were admitted to the United States under President Truman's directive of Dec. 22, 1945.

HEBREW SHELTERING AND IMMIGRANT AID SOCIETY

In the wake of the retreating Nazi armies, HIAS entered Europe and set up offices for the purpose of aiding surviving Jews able to emigrate. The number of offices in a country varied according to its needs. Thus, in Poland, Germany, Italy, and France, where the largest number of refugees was found, from five to ten offices were established in places with the largest refugee population. In other countries, such as Hungary, England, Sweden, Belgium, Switzerland, Portugal, Turkey, Palestine, and China, one to three offices are maintained. HIAS offices and affiliates are also found in Latin American countries.

In cooperation with existing private and governmental agencies, such as UNRRA and the Intergovernmental Committee for Refugees, HIAS aided in preparing Jewish DPs for emigration to the United States, Palestine, and elsewhere. Its immigration staff was called upon by the United States Army and President Truman's Special Committees to implement his directives and to assist in the preparation of identification papers used by displaced persons in lieu of a passport.

WORLD ORT UNION

During 1946, the World ORT (Organization for Rehabilitation through Training) Union continued on a larger scale its service of training Jews in occupational skills. The ORT has trained about 19,000 Jewish men, women, and children in 18 countries. In addition to instruction, the ORT also provided raw materials, machines, and tools for needy artisans.

SOCIETY FOR THE PROTECTION OF THE HEALTH OF JEWS

The work of OSE, the worldwide organization dealing with problems of medical assistance, hygiene, and child care among the Jews, operated in most European countries. To eastern Europe where the need was the greatest, OSE sent physicians, nurses, child-care guardians, concentrated foods, surgical and laboratory equipment. In France, Belgium, and Switzerland, many children's homes, clinics, canteens and other institutions were opened to help refugees. In the displaced persons camps in Germany and Austria, OSE physicians and nurses cooperated with UNRRA, the JDC, and military agencies in restoring the health of the Jews. Additional relief was enlisted by the establishment of a "Foster Parent Plan" through which people all over the world may help orphans and semi-orphans in European OSE institutions.

REFUGEES AND IMMIGRATION

The imperative need of many of Europe's surviving Jews to emigrate increased immigration activity in America. The initial step was taken by President Truman, whose directive on Dec. 22, 1945 provided for the annual immigration of a maximum of 39,681 refugees and displaced persons of all faiths from American occupation zones in Europe and for the reestablishment of immigration facilities in those zones. The order's immediate result was the liquidation, a few weeks later, of the War Relocation Authority's Emergency Refugee Shelter at Fort Ontario, Oswego, New York and the resettlement of the majority of its 923 residents as regular quota immigrants in the United States.

The most encouraging development for the homeless Jews, however, was the arrival in New York in May, 1946 of 1,361 refugees and displaced persons as the first quota immigrants from Europe. On May 20, the *S. S. Marine Flasher* brought 795 DPs and four days later 566 refugees more disembarked from the *S. S. Marine Perch.*

The immigrants were aided notably by the Hebrew Sheltering and Immigrant Aid Society and the United Service for New Americans. The latter organization was created Aug. 1, by consolidating the National Refugee Service and the National Service to Foreign Born Department of the National Council of Jewish Women. Its services include guidance to Americans wishing to bring relatives from Europe to the United States, meeting ships and routing new arrivals to their relatives in other cities, resettlement of immigrants in communities throughout the nation in cooperation with local agencies, retraining and securing employment, aid in naturalization procedure, and assistance in learning English and the customs of the country.

By the end of 1946, however, immigration under President Truman's directive fell short of the maximum of 39,681 persons. For example, a report based on a ship-by-ship compilation of sailings from the American embarkation center at Bremerhaven, Germany, showed that only 6,213 immigrants of all faiths from the DP camps had entered the United States. Aside from the inadequate quota system, a chief cause of the low immigration total was the bottleneck in shipping. The President attempted to overcome this in December by assigning four ships to expedite the transportation of 2,100 displaced persons. Another great obstacle to immigration was the lack of adequate staff in American consular offices to issue visas.

Several times during 1946, President Truman urged Congress to liberalize existing immigration laws. His viewpoint found support throughout the country. Following a recommendation by Mayor William O'Dwyer, the New York City Council passed a resolution urging that the United States give haven to 250,000 displaced Europeans. Two weeks later it raised the figure to 500,000 DPs of all faiths. The Citizens Committee on Displaced Persons, under the chairmanship of Earl G. Harrison, former U. S. Commissioner of Immigration and Naturalization, demanded the admission of 400,000 refugees. Seventy prominent Americans, including Bishop Francis J. McConnell, sent a Christmas appeal to the President asking for the immediate entry of 100,000 displaced Jews into the United States. The same recommendation was made earlier by Rabbi Philip S. Bernstein, adviser on Jewish affairs to General Joseph T. McNarney, commander of United States Armed forces in Europe. In a united effort to save the Jews of Europe, the American Jewish community made pleas and suggestions.

There also was opposition to increasing immigration. For example, in May, a number of Congressmen, supported by spokesmen for the American Legion and the Veterans of Foreign Wars, attempted unsuccessfully, in a section of the proposed Gossett Bill, to cut quotas by 50 per cent for the next ten years. In addition to these, Senator Richard B. Russell, chairman of the Senate Immigration Committee, and Senator Elmer Thomas, of Oklahoma, also advocated curbs on present immigration.

WAR RECORD

According to statistics on the Second World War, published by the Bureau of War Records of the Jewish Welfare Board, more than 550,000 Jewish men and women served in the armed forces of the United States. The total number of known Jewish casualties was close to 25,000, including 7,500 known dead; 17,500 were recipients of citations for valor and merit, totaling 33,446 awards.

SOCIAL WELFARE

With the disappearance of war emergency pressure in 1946, the American Jewish community began to make plans for the improvement and expansion of health and welfare agencies, not only for the marginal lower income groups but for all classes of the Jewish population. Federations of local philanthropies throughout the country raised approximately $35,000,000 for hospitals, community centers, institutions for the aged and religious institutions.

RELIGIOUS ACTIVITIES

The Synagogue Council of America, the coordinating agency for Orthodox, Conservative, and Reform Jewry, adopted a peace-time program in April 1946. It called for the stimulation and advancement of religious life in the American Jewish community and assistance to world Jewry in agreed areas; representation of the totality of religious life of American Judaism, whether before the government, within Jewish secular organizations or in cooperation with non-Jewish religious bodies; defense of Jewish religious beliefs and practices wherever they may be attacked; cooperation with Christians in religious activities and in religious pronouncements on social justice and other moral issues.

In carrying out this program, the Council engaged in various activities. A conference of the Social Justice Commissions of the Federal Council of Churches, the National Catholic Welfare Conference, and the Synagogue Council achieved concurrence on minimum wages, full employment practices, labor unions, and employers associations. The agencies jointly sponsored National Family Week, May 5-12, designed to strengthen the spiritual foundations of family life.

As an effort to rehabilitate religious life in France, the Synagogue Council initiated a plan under which a Jewish community in the United States "adopts" and aids a Jewish community of France. Rabbi Alexander S. Rosenberg was appointed liaison officer between the American Military Government officials in Germany and religious authorities.

In America, vast building and expansion projects were undertaken by national religious agencies, seminaries, and individual congregations. Attempts were made to stimulate religious adherence among the Jews. The importance of developing greater interest in religion was stressed by President Truman on the occasion of the launching of the "American Jewish Cavalcade," a nation-wide religious emphasis program, by the Union of American Hebrew Congregations (Reform).

EDUCATIONAL AND CULTURAL ACTIVITIES

The major facts culled from a study on Jewish educational activities conducted by the American Association for Jewish Education were as follows: the number of children enrolled in all Jewish schools was 231,028, as compared with 190,000 in 1940; curricula were extended and greater emphasis was placed on the Hebraic element; departments of education in Jewish institutions of higher learning were enlarged in view of the dearth of qualified teachers and administrators in Jewish schools; community funds have made larger appropriations for education than in the past.

Efforts to give a new impetus to Jewish education, such as the observance of Jewish Education Month in September, continued. The activities of several national organizations also were directed to this end. For instance, the American Association for Jewish Education organized a Department of Educational Consultation which was to assist communities in reorganizing their educational systems; the National Academy for Adult Jewish Studies held a conference on "New Directions for Adult Jewish Education"; the Board of Higher Education of the Union of Orthodox Rabbis and the Rabbinical Board of Greater New York conducted an extensive enrollment campaign for the Yeshivah schools.

Important work also was done in stimulating an understanding of Jewish culture. The Jewish Education Committee sponsored the study of art, music, and theater appreciation. The Yiddish Scientific Institute and the Central Yiddish Culture Organization published several works in the Yiddish language. The number of books on Jewish subjects distributed by the Jewish Publication Society of America and the Jewish Book Council of America reached a new high. To evoke still greater interest in such publications, Jewish Book Month was observed in November. In the field of music, the activities of the Society for the Advancement of Jewish Musical Culture were augmented by the newly created Society for the Advancement of Jewish Liturgical Music.

THE KU KLUX KLAN

As had been anticipated, with the end of the war, the professional anti-Semites came out into the open and publicly resumed their divisive activities. Old leaders reappeared and were joined by new ones but, in contrast to the pre-war period, few of them have important following, influence, or financial means.

Among the more important divisive groups in action during 1946, easily recognized by their overt anti-Semitism, were the Ku Klux Klan and synonymous groups, the Gerald L. K. Smith-Father Terminiello union, and the coalition of professional Arabian agitators.

Klan leaders openly met in convention in Atlanta, Ga. in May 1946, followed by a torchlight ceremony on Stone Mountain. Burning of fiery crosses and violence against Negroes were reported from various parts of the country. Klan organizers were especially active in the Southeast and Midwest.

Resurgence of the Klan, however, immediately met with public counteraction and widespread repudiation. Within a short period of time, four states revoked the corporate local charters of the Klan, other states began investigations on the status of the Klan within their borders, and the United States Treasury Department started a suit against the Klan for back taxes. New York State, however, is the only state which has an anti-Klan law, making it compulsory for the Klan to file membership rosters.

Far from being altogether removed as a menace to democracy the Klan has returned to quiescence, leaving the field open for its membership to function under various pseudonyms. Georgia, where Eugene Talmadge's campaign openly invited Klan support and where, upon his death, his son became the rallying point for Klan elements, promises to become a refuge for hate-mongerers.

The Columbians, Inc., an anti-Negro, anti-Jewish organization of terrorists, clothed in Nazi-like uniforms, was organized in Georgia during the fall of 1946. At the end of the year, its leaders were under charges and indictment arising out of acts of terror perpetrated by the organization against Negroes; it was faced with repudiation by all respectable elements and with the complete disintegration of the group.

SMITH AND TERMINIELLO

Gerald L. K. Smith and Arthur W. Terminiello, during the first half of 1946, were aided and abetted by unwarranted publicity, picketing, and riots. Thus, these rabble-rousers found an easy sounding board in the American press, with the result that their endeavors were constantly kept alive and prevented from sinking into oblivion. The curious as well as the fanatic added to the good attendance at Smith's meetings. In August 1946, an aroused public and press, weary of the publicity-nurtured Smith, began to see the wisdom of ignoring him. The number of pickets dwindled at his meetings, counter-demonstrations were dignified and led to no rioting, attendance diminished, and, consequently, collections to cover his expenses fell off substantially. The "martyr," who in the first half of 1946 blazed a trail of hatred and divisiveness, was shorn of most of his glory by the end of the year and was put on the defensive by democratic America.

Terminiello, who had been suspended in 1945 by his Bishop for hate-mongering activities, and became affiliated with Smith soon after, severed his connections with Smith in the summer of 1946 and conducted his own activities independently. His following is very small, and he receives little or no publicity.

PROPAGANDA

These various types of poison peddling that have been described also were carried on by other propagandists of lesser significance. For example, several of the old pro-German movements reconstituted their organizations, reformulated their propaganda tactics, and somewhat revamped their old arguments. They also camouflaged their true intentions under the guise of relief activities.

In Chicago, as well as in a few other sections of the country, the 1946 election was significant for the number of overt anti-Semites who sought political office. All were soundly defeated by the electorate.

The mass sedition indictment, which had ended in a mistrial in December 1944 with the death of the presiding judge, was dismissed in November 1946.

In the light of the events of 1946, it appeared that the American public had become more aware of anti-Jewish machinations wherever and in whatever disguise they were manifested and understood more clearly that such maneuvers ultimately serve anti-democratic ends.

DISCRIMINATION IN EMPLOYMENT

Upon its expiration June 30, 1946, the Fair Employment Practices Committee reported to President Truman that a survey conducted in 15 cities showed a marked rise in discrimination against Jews seeking jobs. Since investigation proved that in New York and New Jersey, where fair employment practices are in effect, discrimination was lower than in other states, Jewish organizations in the National Community Relations Advisory Council were active in strengthening the National Council for a Permanent Fair Employment Practice Committee, a group which leads the movement for national legislation.

DISCRIMINATION IN EDUCATION

Discrimination in educational institutions also was given attention. Among the many exposés of bias on campuses was a report by the Mayor's Committee on Unity in New York in the spring of 1946. As a remedy for racial and religious bias, which was found most prevalent in medical colleges, the Mayor's Committee suggested establishing a New York State University. The state legislature defeated a bill to appropriate $50,000,000 for this purpose. However, it passed a resolution authorizing a commission, to be appointed by the Governor, to examine the whole question.

Cognizant of widespread discrimination in education, President Truman pledged the unsparing efforts of the National Commission on Higher Education to eliminate bias from the country's colleges. To combat all hatred and intolerance in the nation, he created a Civil Rights Committee to study and recommend legislation and other measures "for the protection of the civil rights of the people of the United States."

SCIENCE—APPLICATION AND PRINCIPLES

DIVISION XVIII

MATHEMATICS AND ASTRONOMY

MATHEMATICS

By G. T. Whyburn
Professor, University of Virginia

GENERAL

The return of mathematicians to research and teaching from war work, which was almost complete by the beginning of 1946, resulted in greatly increased activity both in papers read at meetings and in published work. In addition to meetings of the American Mathematical Society, Mathematical Association of America, and their associated sections and organizations, research in mathematics received further stimulus from special conferences held during the year, such as the Conference on Algebra at the University of Chicago and the Princeton Bicentennial Conference on The Problems of Mathematics.

The G. D. Birkhoff memorial number of the *Transactions of the American Mathematical Society* appeared during the year, carrying an appropriate dedication by R. E. Langer together with a life-like photograph which will be cherished by Birkhoff's many friends and admirers in mathematical and scientific circles everywhere. In addition an excellent extended account of Birkhoff's life and work written by Marston Morse was published in the *Bulletin of the American Mathematical Society* in 1946.

The year 1946 was further marked by the reappearance of some of the foreign mathematical publications which had suffered suspension during the war. A notable example in this respect was *Fundamenta Mathematicae,* a highly esteemed Polish mathematical journal, which reappeared after a lapse of six years.

In what follows some of the significant developments in mathematical research will be referred to or briefly sketched.

ANALYSIS

According to a classical result of Lebesgue, the ratio of the numerical value of the difference between a continuous function f(x) of period 2π and the n-th partial sum of its Fourier's series to $n^{-\alpha} \log n$ is bounded uniformly in x provided f(x) satisfies a Lipschitz condition of order α $(o < \alpha < 1)$, that is, provided the ratio of $|f(x + h) - f(x)|$ to $|h|^{\alpha}$ is bounded uniformly in x as h approaches zero. It is known that in general the factor log n can not be omitted from this result. However, it was shown by R. Salem and A. Zygmund that the result remains valid with this omission for functions of so-called monotonic type, *i.e.,* functions f(x) for which a constant C exists such that f(x) + C is either never decreasing or never increasing in $(-\infty, \infty)$.

The latter condition can not be replaced by the requirement that the function be of bounded variation.

It was shown by Porter in 1904 that a suitably chosen sequence of partial sums in a Taylor development may converge in a region containing both points inside and points outside the circle of convergence. Porter also noted that this phenomenon was closely related to the accumulation of the zeros of the partial sums on the circle of convergence. In a paper published in the *Duke Mathematical Journal* in 1946, J. L. Walsh undertakes an analogous investigation for sequences of arbitrary analytic functions. The results obtained not only include all known theorems of this type on Taylor's series but also have immediate application to maximal convergence of sequences of rational functions, convergence of analytic functions of prescribed norm of best approximation, convergence of functions of given measure of approximation and minimum norm, and convergence of interpolating functions of minimum norm.

FUNCTIONS

In a series of papers, several of which appeared in 1946, M. Morse and M. H. Heins contributed significantly to the development of topological methods in the theory of functions of a complex variable. Locally simple plane curves are defined and analyzed from the standpoint of their deformation types and classes in a plane. They consider a single valued function $f(z)$ meromorphic in a bounded region R and continuous on the boundary B of R where B consists of k disjoint simple closed curves. Among other things it is shown that if $n(O)$ and $n(\infty)$ are the numbers of zeros and poles of f in R and m is the number of ramification points of the inverse of $f(z)$ on the Riemann image of R, each counted with multiplicity, then under suitable boundary conditions stated in terms of local simplicity of the mapping at boundary points,
$n(O) + n(\infty) - m = 2 - k + q - p$,
where q is the order of the image B' of B relative to the origin and p is the angular order of B'. A similar result is established for interior transformations instead of meromorphic functions.

It has been conjectured by Bieberbach that in the power series expansion $f(z) = z + a_2z^2 + \ldots$ of a function which is regular and smooth (schlicht) inside the unit circle, $|a_n| \leq n$. This has been verified for $n \leq 3$. It was shown by B. Friedman in 1946 that $|a_4| \leq 4.16$. Friedman also showed that in case the coefficients $a_2, a_3, \ldots$ are integers, $f(z)$ is necessarily one of the nine functions z, $z/(1 \pm z)$, $z/(1 \pm z^2)$, $z/(1 \pm z)^2$, $z/(1 \pm z)/(1 \pm z^3)$. In the same connection A. C. Schaeffer and D. C. Spencer (not assuming the a_i to be integers) succeeded in determining the region of variability of the coefficients, that is, the set V_n in Euclidean $2n - 2$ space of points $(a_2, a_3, \ldots, a_n)$ such that $a_2, a_3, \ldots, a_n$ can appear in this order as coefficients in the expansion of a function $f(z)$ satisfying the above form and conditions.

CALCULUS OF VARIATIONS

In a series of papers published in the *Transactions of the American Mathematical Society* and devoted to a study of the general isoperimetric problem of Bolza so formulated as to include most of the interesting problems in the calculus of variations involving simple integrals, M. R. Hestenes developed new properties of the Weierstrass E-function and applied these and the accompanying notions and methods to establish a new sufficiency theorem for a strong relative minimum. This theorem had been conjectured by McShane who had proven the analogous weak relative minimum theorem. Also in 1946 W. T. Reid succeeded in weakening the hypotheses and simplifying the proof the McShane-Tonelli result to the effect that every absolutely continuous solution of the problem of minimizing the integral of $f(x,y,y')dx$ on the range (x_1,x_2) satisfies du-Bois Reymond's form of the Euler equations.

DIFFERENTIAL EQUATIONS

With two notable exceptions the standard general existence theorems for the problem of initial values concerned with systems of ordinary differential equations are local in nature. One of these exceptional cases is represented by those systems whose solutions depend on inversions of quadratures. In a note published in the *American Journal of Mathematics,* A. Wintner singled out a class of differential equations and showed that for this class the above mentioned exceptional case serves as a prototype in the sense that all solutions share a significant property as exhibited in the following theorem: Let $f(t,x)$ be real and continuous on the strip $0 \leq t \leq a, -\infty < x < \infty$ and let $x = x(t), 0 \leq t < t_0$, with t_0 finite and $\leq a$, be a solution of the differential equation $x' = f(t,x)$; then $x(t - 0$ exists, finite or infinite; and if this limit is finite, $x(t)$ can be extended to the closed interval $0 \leq t \leq t_0$ so as to be continuous and differentiable and to satisfy the differential equation.

DIFFERENTIAL GEOMETRY

In a study of the fiber bundles of the complex tangent vectors and their characteristic classes, S. Chern exhibited certain basic classes from which all other characteristic classes can be obtained by operations of the cohomology ring. These cohomology classes can be expressed by exact exterior differential forms which are regular on the real manifold; and it is shown that in case the manifold carries an Hermitian metric, these differential forms can be constructed from the metric in a simple way. Thus the characteristic classes are completely determined by the local structure of the Hermitian metric.

Investigating geodesics on surfaces of revolution, D. P. Ling succeeded in analyzing the number and distribution of the double points of geodesics on such surfaces. The type of surface S considered is generated by revolving about Oy a curve which rises monotonically from the origin to infinity as x increases. In general, each geodesic on S has a nearest point P to the vertex of S and spirals symmetrically in either direction from P, intersecting itself infinitely many times. Ling showed that S may be divided into zones by a sequence of parallels on S so that the double points of the geodesics on S are distributed regularly relative to these zones.

S. Bochner showed that on a compact space with positive definite Riemann metric with Ricci curvature everywhere positive there exists no vector field for which the divergence and curl both vanish. He also proved a related non-existence theorem for negative Ricci curvature.

METRIC GEOMETRY

Metric characterizations of Euclidean and Hilbert spaces among the class [S] of all semi metric spaces were given earlier by K. Menger and W. A. Wilson; that is, necessary and sufficient conditions strictly in terms of the metric were given in order that a member of [S] be isometric with a space of the sort being characterized. Similar characterizations of hyperbolic and spherical spaces have been given by L. M. Blumenthal. In 1946 Blumenthal rounded out this chain of results concerning Euclidean and non-Euclidean spaces by giving metric characterizations for elliptic spaces of finite and infinite dimensions.

G. S. Young characterized spaces congruent with bounded subsets of a line in terms of minimality properties of the linear metric. This may be contrasted with the Menger-Blumenthal characterizations which are given in terms of imbeddability of finite subsets.

PROJECTIVE GEOMETRY

In an article published in the *Bulletin of the American Mathematical Society,* R. Baer developed the thesis that the structure of a projectivity is dominated by the structure of its fixed elements provided this system is not "too small" by investigating those projectivities, called quasi-perspectivities, characterized by the property that every line carries a fixed point. In particular it was shown that this latter property is equivalent also to each of the following properties for a given projectivity f: (1) for each point P, P and its images under both f and f^2 are collinear, (2) for each line h, h and its images under both f and f^2 are copunctual, and (3) every point lies on a fixed line.

FOUNDATIONS OF GEOMETRY

Referring to descriptive geometry as "essentially the linear geometry of a convex region" and seeking to characterize the general concepts of the subject by properties lending themselves to algebraic development, W. Prenowitz presented an axiomatization of descriptive geometries in terms of join and extension by assumptions closely analogous to algebraic and group theoretic axioms. This leads to a form of generalized group with a many valued composition and is termed a multigroup.

ALGEBRA AND THEORY OF EQUATIONS

A linear subspace A of the space M of all linear transformations over a field F on a linear n-dimensional space is weakly closed relative to transformation multiplication (*i.e.*, the product operation ab in M) if there are elements x and y in F not both zero such that $x\,ab + y\,ba$ is in A for every a and b of A. Such subspaces A are known to be of three basic types, two of which have been subjected to extensive structure analysis. The third type, that in which the characteristic of F is not two and A is closed relative to the non associative product $a.b = (ab + ba)/2$ is the subject of a far reaching study by A. A. Albert published in the *Transactions of the American Mathematical Society* in 1946. In this case the spaces A form commutative non associative algebras with respect to the operation a.b and they are called *Jordan algebras* by Albert. Fundamental structure theorems for such algebras over a non-modular field are established.

Evelyn Frank gave an algorithm for determining the number of zeros of a polynomial with complex coefficients and extended the method used in this so as to make it yield actual computation of the zeros by successive approximations. The computation involves only the iterated processes of synthetic division and cross multiplication and eliminates entirely the necessity of computing with complex numbers. Thus it is adaptable to routine calculation with ordinary machines.

NUMBER THEORY

P. Erdös and I. Niven proved that no two partial sums in the harmonic series can be equal and also that for only a finite number of integers n can one or more of the elementary symmetric functions of 1, 1/2, . . . , 1/n be an integer. This connects up with the known result that the sum of the reciprocals of the integers lying between two given integers m and n is never an integer for any m and n.

Erdös proved the conjecture of Aulack, Chowla, and Gupta to the effect that if $p_k(n)$ denotes the number of partitions of n into exactly k summands and $p_{k_0}(n)$ denotes the maximum $p_k(n)$ for n fixed, then k_0 is asymptotically equal to $c^{-1}n^{\frac{1}{2}} \log n$ where $c = \pi(2/3)^{\frac{1}{2}}$. Also on the subject of partitions, D. H. Lehmer showed that the number of partitions of n into parts differing by d or more is not equal to the number of partitions of n into parts taken from any set S of integers whatever, except when d = 0, 1, or 2, and also not equal to the number of partitions of n into distinct parts taken from any set S of integers whatever except when d = 1.

Gordon Pall and Arnold Ross made essential contributions in connection with the problem of representing all positive integers in the form of a sum of four squares with fixed integer coefficients. In particular Pall completed the solution to the problem of Kloosterman, originally formulated by Ramanujan, of determining all sets of coefficients for which a form of this type will represent all positive integers.

GROUP THEORY AND LATTICE THEORY

A comprehensive study of the structure and ideal theory of complete local rings was published in the *Transactions of the American Mathematical Society* by I. S. Cohen. R. Baer proved that the only group which can be a retract of every containing group is the identity; hence only modifications of the topological concept of a retract will be useful in group theory. Baer suggests and proves theorems supporting the following groups as retracts: (1) the complete groups, (2) abelian groups the orders of whose elements are finite, and (3) the free groups.

It was proven by P. M. Whitman that any lattice is isomorphic to a sublattice of the lattice of all equivalence relations on some set. This means essentially that any lattice is a lattice of equivalence relations. In view of G. Birkhoff's result that any lattice of equivalence relations is isomorphic to a lattice of subgroups, this gives that any lattice is isomorphic to a sublattice of the lattice of all subgroups of a suitable group.

TOPOLOGY

The first topological characterization of a plane was given by R. L. Moore in 1916. This was followed shortly by a similar characterization of the sphere by R. L. Moore and J. R. Kline. In the intervening years these notable results have been the subject of much study and considerable simplification and extension by numerous mathematicians, including R. L. Wilder, L. Zippin and E. R. van Kampen, among others. The characterization of the sphere had been perfected into the following form: A locally connected continuum is a topological sphere if and only if it contains at least one simple closed curve, is separated by every such curve it contains, but is not separated by any proper arc of any such curve it contains. It had been conjectured by Kline that the last named condition could be replaced by the simpler condition that the continuum be not separated by any pair of its points. After remaining unproven for a number of years, the correctness of this conjecture was established by R. H. Bing in 1946. Thus the topological 2-sphere can be characterized in terms of topological spheres of lower dimensions. For, since the topological 0-sphere is a pair of points and the topological 1-sphere is a simple closed curve, it is now possible to assert that a non-degenerate locally connected continuum is a topological 2-sphere if and only if it is separated by every topological 1-sphere but by no topological 0-sphere that it contains. This parallels the long known characterization of the topological 1-sphere (simple closed curve) as a non-degenerate continuum separated by every topological 0-sphere (point pair) it contains.

The 1946 summer meeting of the American Mathematical Society was highlighted by the well organized and comprehensive Colloquium Lectures on "The Topology of Smooth Manifolds" by Hassler Whitney. Whitney brought out many interesting new developments connecting up topological methods with the concepts and results of several other fields of mathematics, notably those in which differentiability plays an essential role.

A. D. Wallace obtained a generalization along homotopy lines of the structure theory of locally connected continua. Analogs of cyclic elements and of A-sets, called *extension sets,* were set up in terms of homotopy relations and many structure theorems similar to known results for cyclic elements and A-sets were established. Thus this basic subject assumes a form strictly appropriate for inclusion in *analytic topology.*

S. Eilenberg and D. Montgomery proved an important and comprehensive fixed point theorem for multivalent transformations. This embraces not only the Lefschetz theorem for single valued mappings but also the Wallace and Kakutani results for multiple valued transformations applied to dendrites and dendritic spaces. F. B. Jones proved that any locally connected complete metric space not cut by any pair of its points and containing no skew curve of type 1 in the Kuratowski sense is separable.

An excellent review of the classical and most fundamental triangulation problem for manifolds was given by S. S. Cairns. This problem has been solved in its full generality only for two dimensional manifolds. F. A. Valentine presented an interesting study of set properties determined by conditions on their linear sections.

Existence and properties of extensions of homeomorphisms of the interior I of a 2-cell with boundary C onto a plane region R were established by E. E. Floyd. Floyd showed that if the homeomorphism is uniformly continuous, its extension is non-alternating when reduced to a mapping from C to the boundary of R. This and related results are applied to obtain certain results concerning conformal maps, notably the Osgood-Carathéodory Theorem.

G. S. Young gave a method of introducing local connectedness into certain non-locally connected sets by an appropriate change of topology. With the use of this method one is able to prove numerous theorems in the more advantageous setting provided by the presence of local connectedness.

TOPOLOGICAL DYNAMICS

W. H. Gottschalk and G. A. Hedlund considered flows in which the parameter space of reals in the usual continuous flow is replaced by an additive abelian locally compact topological group. The action of such a transformation group T on a point and the action of certain subgroups G of T were shown to be related in that a general recursive property of T carries over to G. This result has as a corollary that in the case of a continuous flow, if a point is either almost periodic, recurrent, or strongly recurrent relative to the continuous flow, it retains this property relative to the discrete flow generated by fixing the parameter t and iterating the transformation thus singled out.

Also Gottschalk studied pointwise non-wandering mappings, that is, mappings f(X) such that for any neighborhood U of a point x there are infinitely many integers n such that U intersects $f^n(U)$. Similar results as for recurrent transformations were shown to hold, for example: (1) if f has this property, so also has f^k for any positive integer k, (2) if X is connected and f has this property, every cut point of X is periodic, and (3) if X is a semi-locally-connected continuum and f has this property, all cyclic elements other than end points are periodic.

It was shown by S. B. Myers that a close connection exists between the equicontinuity of a set of mappings and the compactness of the closure of the set in the natural topology of the mapping space, even when compactness conditions on the spaces acted on by the mappings are considerably lightened. Applications of the results obtained were made to yield certain conclusions concerned with transformation groups and with recurrence of homeomorphisms.

ASTRONOMY

By Rupert Wildt
Assistant Professor, Yale University

ASTRONOMERS AND OBSERVATORIES

The 74th meeting of the American Astronomical Society was held at Columbia University Feb. 1-2, 1946; originally it had been scheduled for February 1945 but was cancelled because of wartime restrictions on travel and meetings. The 75th meeting took place Sept. 8-11 at the University of Wisconsin. Dr. Otto Struve, director of the Yerkes and McDonald Observatories, was elected President of the Society. The 76th meeting, held at Harvard University Dec. 26-30, was a particularly large one, and the program comprised a number of symposia. These dealt with "Interstellar Matter," "Electronic and Computational Devices of Interest to Astronomers," "Eclipsing Binaries," and "The Gaseous Envelope of the Earth." Another notable feature of this meeting was the address by Prof H. N. Russell on "The Royal Road of Eclipses," the first annual Henry Norris Russell Lecture established by his friends and colleagues to honor the dean of American astronomers.

Dr. E. T. R. Williams (Mrs. A. N. Vyssotsky) of the Leander McCormick Observatory, received the Annie J. Cannon Prize of the American Astronomical Society. The Henry Draper Medal of the National Academy of Sciences and the Catherine Wolfe Bruce Gold Medal of the Astronomical Society of the Pacific were awarded to Dr. Paul W. Merrill of the Mt. Wilson Observatory. The Potts Medal of the Franklin Institute went to Dr. Ira S. Bowen, director of the Mt. Wilson Observatory. Dr. Leo Goldberg entered upon the directorship of the three observatories of the University of Michigan.

In 1940 Harvard College Observatory established a station for solar observations at Climax, Colorado, which during the past year has been operated jointly by Harvard and the University of Colorado. Its name has now been changed to High Altitude Observatory of Harvard University and the University of Colorado. New buildings and equipment are planned for a site on national forest land about five miles from the present station. The legislature of California allotted $30,000,000 to the University of California. Included in this allotment is the sum of $1,200.000 for the construction of a large reflecting telescope for the Lick Observatory. Work on the design of this instrument is proceeding on the basis of an aperture of 120 inches and focal length of 50 feet (F/5). The mounting will probably be of the long fork type. The location selected is on the main ridge of Mt. Hamilton.

ASTRONOMY AFTER THE WAR

Early in 1946 most astronomers had returned from defense research to their normal pursuits. Consequently, the scientific output of the observatories has begun to rise again. In many ways, astronomers have profited from their experiences during war work. Some of them have mastered new experimental techniques. Special equipment developed by the Armed Forces became a useful tool for astronomical research. In fact, the most startling astronomical news of 1946 was the results of the application of such novel tools. Even such time-honored branch of practical astronomy as the art of navigation felt the impact of the war. Improvement of the methods of aerial navigation remains an urgent problem, as the speed of travel through air continues to increase. A clearing house for information and ideas on navigation has been established in the form of The Institute of Navigation (1911 Eye Street, N. W., Washington, D. C.). This organization is already international in its membership and is devoted to the promotion of safety by sea and air. The Institute will publish its proceedings in a new journal, bearing the title *Navigation*.

The development of servo-mechanisms and high-speed calculating machines, under the pressure of war needs, now begins to influence the art of measuring photographic plates and computing final data from the crude measurements. Among the most time-consuming tasks of observational astronomy is the routine determination of the position and brightness of large numbers of stars, as recorded on photographic plates. Serious efforts are now being made to render these procedures of measurement and computation completely automatic by the use of specially designed machines. It may confidently be expected that within a few years the practice of "catalogue making" in stellar astronomy will have been revolutionized by these methods.

RADAR AND THE MOON

On Jan. 25, 1946, the Signal Corps of the U. S. Army announced that pulses of electromagnetic short-wave radiation, projected toward the Moon by a directive antenna, had been returned as faint echoes within a time interval of about 2.5 seconds; that is the exact time required for two-way transmission over the distance Moon-Earth. The conclusion, that the signals received were really echoes from the Moon, is supported by computations of the strength of the expected echoes, which was well above the sensitivity of the receiving set. Priority in success, however, was claimed by scientists at the University of Sidney, Australia, who state that, in the fall of 1941, they did contact the Moon several times, but publication had to be withheld on account of wartime restrictions.

Impressive though this accomplishment is, of greater scientific import are the investigations of the short-wave electromagnetic radiation emanating from the Sun; these were carried out by numerous scientists in this country and throughout the British Empire during the war, but the results were released only recently. The energy output of the Sun in the range of wave lengths between 1 and 10 meters is about 1000 times that of a "perfect" radiator of 6000°K, *i.e.*, the surface of the Sun as deduced from its total emission of light and heat. The angular resolving power of the new detecting devices does not yet suffice to ascertain whether the electromagnetic radiation originates from localized areas in the Sun's atmosphere or emanates from all over the surface. It has been suggested that the seat of the powerful electromagnetic radiation is in the solar corona.

INFRARED DETECTING DEVICES

The investigation of the infrared part of stellar spectra has long been handicapped by the poor sensitivity of photographic plates in this spectral range. Even with the best sensitizing dyes it is difficult to reach wave lengths greater than about 10 000 A. Beyond this point only thermopiles and bolometers could penetrate, but their sensitivity is also too small to permit the study of any celestial objects but the brightest. During the war, J. R. Cashman, at Northwestern University, developed a new photoelectric cell which utilizes the sensitivity of lead sulphide to infrared radiation. Preliminary experiments with this type of cell, made by G. P. Kuiper at the McDonald Observatory during 1946, raised high hopes. Kuiper has succeeded in recording the infrared spectra of several bright stars and planets all the way to 25 000 A, and many new absorption features in the infrared were discovered. Their detailed study is still under way.

The limiting magnitude of faint stars accessible to this device depends, of course, both on the size of the telescope which concentrates the stellar radiation upon the cell, and on the temperature of the star under investigation. Maximum response of the cell is to the coolest stars, which emit most of their radiation in the infrared; conversely, hot stars make rather poor objects, because their energy maximum is in the ultraviolet. As an example the variable star R Leonis (surface temperature about 3000°K) may be mentioned. This star of 10th visual magnitude was observed by Kuiper with the 80-inch reflector, and its infrared radiation was found to be more than 1000 times as powerful as that of Regulus (surface temperature about 10 000°K), which is of the first magnitude visually.

Another promising device is the so-called superconductivity bolometer, developed under a war contract by D. H. Andrews and his collaborators at the Johns Hopkins University. Astrophysical applications of this instrument have long been contemplated and are now expected with the greatest interest.

SOLAR OBSERVATIONS FROM ROCKETS

Another spectacular application of war-born devices to scientific research is the use of rockets to carry various instruments into the stratosphere. The readings of these instruments, in some cases, are radioed back to the base; in other cases the instruments, after the rocket has reached the peak of its trajectory, are detached and guided back to the ground by parachute. Of greatest astrophysical interest are the photographic records of the ultraviolet solar spectrum obtained by the second method with a specially designed spectrograph (R. Tousey and collaborators at the Naval Research Laboratory). The spectrum recorded at an altitude of 50 miles, the maximum reached so far, extends down to a wavelength of 2200 A, while at the Earth's surface the spectra of celestial objects are cut off at about 2950 A by the powerful absorption of the ozone layer. The terrestrial ozone is spread widely throughout the lower stratosphere, but at an altitude of 50 miles the spectrograph had in effect passed the ozone screen.

If it should prove possible to carry a spectrograph as high as 100 miles, even more of the ultraviolet solar spectrum would become accessible, because then an appreciable fraction of the absorption (below 2000 A) caused by the oxygen and nitrogen molecules would have been eliminated. The few results obtained so far are of merely qualitative nature, that is to say, the photographs show the existence of the ultraviolet solar radiation below 2900 A. The ultimate aim of these researches is, of course, to measure quantitatively the strength of the ultraviolet spectrum, or to determine its energy curve. A knowledge of the ultraviolet energy curve of the Sun would be of great practical value because of its bearing on the processes in the terrestrial ionosphere and its indirect influence on communication by radio. Moreover, since the Sun represents a type of star rather common in the universe, any new information about the Sun would likewise shed light upon the properties of an important class of stars. It would seem conceivable that some day it will become possible to study even the faint light of stars with instruments carried aloft by rockets, but probably many years will pass before this dream of astronomers comes true.

LUNAR OCCULTATIONS OF STARS

One of the most difficult problems of observational astronomy is the direct measurement of the angular diameter of stars, the largest of which do not exceed one tenth of a second of arc. In the hands of F. G. Pease, at the Mt. Wilson Observatory, the Michelson interferometer revealed measurable diameters of only half a dozen giant stars, more than 20 years ago. In 1938, J. D. Williams analyzed theoretically another method of discerning the true diameter of stars. If on its course through the sky the Moon's dark limb passes over a star, it will not disappear instantaneously because of the diffraction of light by the interceding limb. Rather a certain diffraction pattern will sweep over the observer's eye, and the intensity distribution in this pattern is a function of the angular diameter of the occulted star, and to some extent also of the distribution of surface brightness over the star's disc. Although the response of the human eye is not rapid enough to perceive the intensity fluctuations caused by the passage of the pattern, a high-speed recording device might be so, as Williams suggested.

A first attempt to obtain such a record of the diffraction was made in 1938 by A. E. Whitford, at the Mt. Wilson Observatory, and was repeated in 1946 with improved apparatus. The 1946 occultations of four stars were observed with the 100-inch telescope, and the diffraction pattern was recorded by means of a multiplier phototube, cathode ray oscillograph, and moving film camera. The diffraction maxima and minima of the two stars Nu and Kappa Virginis (predicted angular diameter 0″008 and 0″.005, respectively) were less pronounced than those for a point source. Preliminary calculations, based on resolving the stars into equivalent doubles, show agreement with theory within the limits of observational error. For two smaller stars no significant departure from point-source pattern was expected, and none was observed. It seems possible now to determine the angular diameters of stars within 10 per cent, in the range from 0″.005 to 0″.015. The Moon, in all positions of its orbit, occults about a dozen stars, whose angular diameters, calculated from their magnitudes and spectral types, are larger than 0″.005. For these stars there appears to be a definite hope of obtaining an experimental measure of the diameter by observing the diffraction pattern at the time of occultation.

THEORY OF CONTINUOUS STELLAR SPECTRA

At Yerkes Observatory, S. Chandrasekhar has brought to conclusion a long series of investigations on the continuous spectrum of the Sun and the stars, which constitutes a milestone in the development of theoretical astrophysics. The task he had set himself is the prediction of the intensity distribution in the continuous spectrum, for any total flux of radiant energy (measured in ergs per square centimeter per second) traversing a stellar atmosphere of known chemical composition. The solution comprises, in fact, two separate problems. The first one is the evaluation, from the theory radiative equilibrium, of the variation with depth of the local temperature. The monochromatic radiation emerging at the surface can then be found by summation over the radiation emitted at all levels throughout the atmospheres, taking into account that the radiation originating at any particular level is weakened on its way to the surface by the extinction of continuous radiation in the overlying mass of the atmosphere. The computation of the extinction factor requires a knowledge of the physical processes producing the continuous absorption. Thus the second problem is to derive the appropriate extinction coefficient from a quantum mechanical theory of the absorption process.

The expressions describing the state of radiative equilibrium and the emergent radiative flux have long been known, but only appropriate solutions of the integral equations involved were available. Chandrasekhar has devised a powerful mathematical method capable of producing numerical solutions, accurate to any degree that may be desired, of all the integral equations appearing in the theory of radiative equilibrium. Indeed, it has now become possible to solve many specialized problems, including such refinements as the influence of atomic absorption lines on the continuous spectrum (blanketing effect) and the polarization of the emergent flux when scattering by free electrons outweighs the continuous absorption. It is possible, moreover, to state precisely how the emergent flux varies with the angle of emergence; in other words, the variation of surface brightness of the Sun across the disc (limb darkening) can be predicted rigorously.

The source of the continuous absorption in the atmospheres of the hotter stars has long been recognized as the process of ionization of atomic hydrogen, which is associated with the well-known continuous spectra adjacent to the series limits (Lyman, Balmer, Paschen continuum). In the Sun, and in the cooler stars, this absorption by atomic hydrogen is too weak to account for the observed intensity distribution in the visible range of the spectrum (4000-8000 A).

In 1938, it was first suggested by the reviewer that the continuous absorption in the atmospheres of the Sun and stars of similar type was produced by the ionization of the negative hydrogen ions. These particles, which consist of neutral hydrogen atoms to which a second electron is weakly attached, have been observed in laboratory experiments with the mass spectrograph, but they have never been isolated in amounts large enough to permit studying their absorption spectrum in the laboratory. Hence it became necessary to derive the absorption spectrum from the quantum mechanical theory of the negative hydrogen ions, a task which proved very laborious indeed. Chandrasekhar's investigations culminated in the proof that the observed intensity distribution in the emission spectrum of the Sun can be explained quantitatively by the absorption caused by negative ions of hydrogen, in conjunction with the general theory sketched in the last paragraph. Although the other constituents of the solar atmosphere, particularly atomic hydrogen and metals, also exert continuous absorption, their magnitude is numerically negligible compared with that produced by the negative hydrogen ions. In other words, what Chandrasekhar's researches have accomplished is the identification of the negative hydrogen ion in the solar atmosphere, by means of its continuous absorption spectrum.

G. Münch, a student of Chandrasekhar, has extended his work to the interpretation of the continuous spectra of the stars hotter than the Sun. As the temperature increases, the continuous absorption of atomic hydrogen gradually supersedes that of the negative ions, becoming dominant at surface temperatures of about 10 000°K, *i. e.* in stars of spectral class A. In the hottest stars, of spectral class B, hydrogen is largely ionized; in that case, the scattering of radiation by the free electrons outweighs the continuous absorption of the few remaining hydrogen atoms. Now the escape of radiation through an atmosphere consisting predominantly of free electrons is accompanied, as Chandrasekhar's new mathematical theory predicted, by strong polarization of the radiation emitted at the limb of the stellar disc. Preliminary experiments undertaken at the Yerkes Observatory have led to the discovery of these very polarization effects; the observations were undertaken during a partial eclipse of a B star by a larger dark companion, which shielded the unpolarized light emitted at the center of the B star's disc.

MOTIONS OF GLOBULAR STAR CLUSTERS

The globular star clusters are remote members of our own galactic system, as was demonstrated by Shapley 30 years ago, and are scattered around its outer fringes. On account of their large distances from the Sun, neither internal motions of individual stars have been observed, nor is there much hope of measuring the tangential motions of these objects, with respect to stars in the foreground. However, their motions in the line of sight, discovered by Slipher, can be measured spectroscopically by the line-shifts resulting from Doppler effect. N. U. Mayall has recently reported the results of many years of work with the Corssley reflector of the Lick Observatory, during which the radial velocities of 50 globular clusters altogether were determined; all of them fall within the previously known range from +291 to −360 km/sec. The excess of negative velocities is owing to selection, for the majority of the observed clusters are located in galactic longitudes (145°-325°) where the solar motion component is negative. An important characteristic of the distribution of the observed clusters over the celestial sphere is the apparent lack of velocities between galactic longitudes 40° and 190°, and again between longitudes 230° and 300°. The first of these gaps, in the direction opposite to that of the galactic center, is quite real; there is but a single cluster known throughout a region comprising more than one-third of the sky. The second vacancy is simply owing to the fact that most of the globular clusters in that region can not be observed from the northern hemisphere of the Earth.

Despite this unfavorable distribution of the observed clusters, an attempt has been made to determine the solar motion with respect to the system of globular clusters. According to current ideas the Sun moves in a circular orbit around the galactic center located near longitude 325°. Viewed from the galactic North pole, the motion is clockwise. As a first step in the proposed analysis, the measured radial velocities of the clusters were corrected for a local solar motion of 20 km/sec toward the convential apex; by this procedure, any solar motion deduced from the cluster velocities is referred to a moving coordinate system whose rotational velocity about the galactic center corresponds to the average motion of the near-by stars. After a lengthy discussion of possible systematic errors Mayall arrives at the velocity V = 200 km/sec (toward galactic longitude 55°) as the most probable for the solar motion (or strictly that of the rotating system representing the general neighborhood of the Sun) referred to the globular clusters.

Now, in discussions of galactic rotation the Sun's orbital velocity is commonly held to be of the order of 275-300 km/sec, a figure which Mayall accepts after renewed discussion. He concludes that there is a real difference of 80-100 km/sec between the Sun's motions with respect to the galactic center and to the system of globular clusters. The interpretations of this result appear possible: either (1) a smaller circular velocity (V = 200 km/sec) for the Sun than hitherto accepted, and no significant rotation of the cluster system, which then should show a nearly spherical distribution for lack of dynamical flattening; or (2) an appreciable amount (75-100 km/sec) of systematic rotation for a flattened cluster system and a solar orbital velocity as hitherto assumed (V = 275-300 km/sec). No cogent decision between these alternatives is possible at present, but Mayall inclines to favor the second explanation.

COSMIC EVENTS

There was no total solar eclipse during 1946, but the year was rich in comets. In addition to several well-known periodic comets returning in 1946, five new ones were discovered. They are Comet 1946a (Timmers), discovered in February at the Vatican Observatory; Comet 1946c (Padjusakova-Rotbart), discovered in May independently at the Skalnate Pleso Observatory in the Tatra Mountains of Czechoslovakia and by an amateur astronomer at Washington, D. C.; Comet Jones and Comet Berry discovered in New Zealand, and Comet Bester discovered in South Africa. None of these objects was conspicuous.

The return of the periodic Comet Giacobini-Zinner, in October 1946, had been eagerly expected by astronomers, because during its last close approach to the Earth, in 1934, a spectacular shower of meteors had occurred. On the date of the closest approach, October 9-10, 1946, bad weather prevailing over large parts of the United States prevented most visual observers from spotting any meteors. However, three Army radar stations, alerted at the request of scientists, recorded numerous echoes from the ionosphere, which are believed to have been caused by disturbances created by the passage of meteors through the ionosphere.

A. Deutch, at the Yerkes Observatory, noticed Feb. 9, 1946 that Nova T Coronae Borealis (1866) had suddenly risen to the third magnitude after, for the past 80 years, it had hovered around the tenth magnitude; a distinct brightening of this star had already occurred in 1938. The outburst of 1946 is remarkable for the fact that its light-curve duplicates to a high degree the light-curve of 1866. This star has now become the outstanding representative of the small class of recurrent novae. The similarity of the light-curve of 1866 with that of other recurrent novae had, in fact, led the Russian astronomers, Kukarkin and Parenago, to predict the recurrence of the nova state for T Coronae Borealis.

ENGINEERING AND CONSTRUCTION

STRUCTURAL ENGINEERING

By Walter E. Hanson
Assistant Professor, University of Illinois

GENERAL

As the first full post-war year of the atomic age, 1946 was a year of greatly increased building and construction with the largest part of the growth resulting from the expansion of private and public industry. Several factors have influenced the magnitude of the increase in building activity. There has been considerable development of projects dormant during the past four years because of wartime restrictions. The return of millions of service personnel to civilian status has created the difficult problem of supplying millions of homes in the shortest possible time.

The year, with its record of an approximate increase of 150 per cent in total construction over that for 1945, was nevertheless a year of transition. The high bids received on some projects were caused largely by uncertainties both in the availability of materials and the demands of union labor. In some cases projects were not put under contract because of the increased costs, but in general the feeling was that the higher prices on bids remained in line with the current value of the dollar.

Many authorities have predicted an improvement in the delivery of building supplies for 1947. The past year was a sellers' market with a buyers' market expected within the next year. At that time material supply will cease to be the major bottleneck in the present curtailed building program. It is also expected that there will be a reduction in work stoppages by labor disputes as conditions become more stable. The fact that most of the uncertainties and bottlenecks of the transition period have been surmounted gives a sound basis for an optimistic forecast of the future for the construction and building industry.

The planning commissions of many cities have made extensive surveys and recommendations dealing with increased traffic problems, zoning laws, and building expansions. These reports and recommendations have lead to increased municipal construction and development over and beyond that amount which was held in abeyance during the war. Cities, large and small, are finding inadequacies in their water systems and sewage disposal methods. Large cities will soon have many express highways under construction which, together with increased parking facilities, will relieve both the midtown and arterial traffic problems.

New highway projects have contributed considerably to the increase in public construction. Large expenditures of Federal and state-aid funds were resumed after several years of very little new highway construction. The speed with which road-building was implemented and the success of its prosecution was hampered by several factors. There have been shortages of engineering personnel in the state highway departments. Contractors were available to undertake the new work but the short supply of construction materials and the lack of labor resulted in high bids and slow progress after the projects were placed under contract.

During the year there was increasing evidence that the development of water resources would constitute a major portion of the total construction in the future. The construction of dams and related river developments, stopped by the war, was resumed by the Bureau of Reclamation, U. S. Army Engineers, and Tennessee Valley Authority. In addition to the continuation of these old projects, many new designs have been completed and, in many cases, were actually placed under contract during 1946.

Very few large bridges were under construction during 1946. The activity along this line was somewhat limited to the preparation of plans for bridges to be placed under construction in the near future. However, a large number of small bridges and grade separations were completed as part of the development of highways. Many cities have plans under way which call for the construction of bridges and viaducts as part of their activity to contend with increased traffic.

RESEARCH

There was increasing evidence during 1946 that structural engineers were incorporating into their designs the results of the wartime research development. This fact is substantiated by the revision of design specifications, the use of new alloys, and the evidence of unique concrete and wood structures. The results of a large portion of the research completed during the war became available for general use and study through the removal of secretive classifications. The continuance of the large research projects by the Army and Navy, along with the increased research activity of private industry and various organizations, is indicative of an accelerated trend toward expanded scientific research as it affects the structural engineer.

Structural research and investigations have increased proportionately along with the total expanded peacetime research program. During the war most of the research programs were directed by the Government; in view of this fact, any comparison of the amount of research undertaken during the year should be made relative to the pre-war years. Many of the projects under way at the end of the war were continued either by the Government or under supervision of private industry. The amount of research conducted by the Army and Navy combined with that carried on by private industry and various organizations exceeded the magnitude of any previous peacetime year.

Theoretical and experimental research in the field of aircraft structures continued to constitute a large portion of the structural research undertaken or completed during the year. The advancements in other phases of aeronautical science present new problems in design for the structural engineer to solve. Some of the investigations in this field dealt with the behavior of common structural members to determine more exact methods of analysis. The purpose of other research was the development of new techniques of design and construction. Certain developments in the use of new metals and wood, the result of research in aircraft structures, can be used to advantage by engineers in other fields. The National Advisory Committee for Aeronautics, vastly productive during the war, continued to be responsible for much of the research work in this field.

The reports and discussions of the various research projects under way to solve certain dynamic problems encountered in the design of suspension bridges occupied considerable space in engineering publications. Much of the research involved the study of a model of the new Tacoma Narrows Bridge; nevertheless, the results of the investigations will have some irrevocable value to designers of all future suspension structures. Test instruments were installed at various points on the Golden Gate Bridge to record the oscillations of the structure under action of the wind.

A review of research projects of interest to the structural engineer should include the work sponsored by the Public Roads Administration in cooperation with the State Highway Departments. The program included the study of slab and beam construction and the investigation of impact and dynamic stresses in highway bridges. Other miscellaneous projects, financed in various ways, were concerned with fatigue strengths, welded structures, riveted joints, thin webs, and timber girders.

NEW DESIGN TECHNIQUES AND UNUSUAL CONSTRUCTION

Post-war construction is able to capitalize on the greater knowledge and improved techniques of welding developed during the war. A 16-story hospital was built in Hartford, Conn., during 1946, using 3,000 tons of structural steel and the equivalent of 21,000 feet of ¼-inch fillet welds. Another indication of the increasing prominence of welded construction is the use of H-section welded roof trusses in a building for the General Electric Co. at Tiffin, O., which enables suspended loads to be located without the usual panel point limitations. Satisfactory results were obtained from tests on these trusses, and no doubt many future building designs will incorporate similar roof trusses.

During the year there was increased use of precast concrete shapes and structural units which in some cases may have been the result of steel shortages. Some buildings were constructed by using precast thin reinforced structural members. The units are connected by welding the reinforcing steel and by other ingenious methods. One of the outstanding projects using precast units was a 4,000-ft. concrete causeway at Richmond, Calif. All parts of the structure, except the pile caps, were precast, thereby simplifying and standardizing construction operations.

Considerable research on aluminum alloys was made during the war, and as a result, increased knowledge of the suitability of aluminum alloys to various types of structures is now available. The installation of two aluminum deck-plate girders as one of the seven spans which comprise a railroad bridge over the Grasse River near Massena, N. Y. is probably the first step in the increased use of aluminum in bridge structures. No attempt was made to justify the use of the aluminum span from the standpoint of economy; however, the expected lower maintenance expense, combined with the smaller erection cost, will tend to offset the high initial cost of material.

Roller bearings under each of the main pillars supporting a Los Angeles office building were used for the first time in construction history to eliminate earthquake stresses. The specially designed roller bearings permit the structure to move anywhere within a 12-inch diameter circle to absorb earthquake shocks; the roller units are designed to carry column loads of 250,000 pounds. The installation eliminates much of the additional strength in the framework required to withstand the horizontal stress caused by seismic disturbances.

A viaduct, built during the year by the Department of Highways, State of Washington, employed a very unusual pier design. The piers have a single column on the centerline of the structure in place of the conventional two column design. The dimensions of the column top at a point where it widens out to become a floor beam is 3 ft. by 6½ ft. This type of pier design was chosen as the simplest means of eliminating skewed construction in passing over two railroads and a highway.

DAMS AND RELATED CONSTRUCTION

For the first ten months of 1946 there was a ceiling on the expenditure during the fiscal year for civil works construction by government agencies. With the lifting of the ceiling in November, the U. S. Army Engineers and the Bureau of Reclamation were able to award contracts for considerable additional construction. There are dams, river developments, and irrigation projects, either under construction or being planned, in every state. In view of the large number and the impossible task of describing all of them, this section is limited primarily to a review of the major projects, either completed or under construction during 1946.

ANDERSON RANCH DAM, IDAHO

Construction on Anderson Ranch Dam across the Boise River in central Idaho consisted of adding an additional height of 156 feet of earth fill to the 300 feet which had been placed before the project was halted by the war. It is the highest earth-fill dam in the world. Much of the earth was brought a distance of several miles by a unique conveyer belt system which covered terrain impassable by any other means of transportation. It is expected that construction will be completed to the extent that 500,000 acre-feet of water will be impounded by the summer of 1948. The reservoir will provide water for irrigation, flood and silt control, and future power development. The installed capacity of the power facilities at the dam will be 41,500 kw.

DAVIS DAM, ARIZONA

Work on Davis Dam near Kingman, Ariz. was resumed by a new contract; construction of the dam was stopped in 1942 by WPB. The dam will include 3,900,000 cu. yd. of earth and rock fill, creating a reservoir storage of 1,820,000 acre-feet which will extend to within one mile of Boulder Dam, 67 miles up the Colorado River. The entire cost of Davis Dam is expected to be approximately $77,000,000 including generators, turbines, transmission lines, and finishing work. The major part of the development of the Colorado River from Lake Mead to the Mexican border will be completed with the construction of Davis Dam. Its completion will fulfill an obligation incurred by the United States in connection with the Mexican Water Treaty. Also, it will provide a source of power, regulate the releases from Boulder Dam, and give additional flood protection.

MISSOURI RIVER BASIN DEVELOPMENT

The ten-year program of flood control and utilization of water resources of the Missouri River Basin was given a substantial start in the appropriation bill passed by Congress in April, 1946. The construction is to include reservoirs, levees, and channel improvements, with the Bureau of Reclamation and the U. S. Army Engineers accepting joint responsibility in the development. Preliminary work was started on Garrison Dam located 75 miles northwest of Bismarck, N. D. on the Missouri River. It was the inauguration of the plan to develop the Missouri River Basin in the interests of flood control, irrigation, navigation, and hydro-electric power. The Garrison Dam will be the largest rolled-fill dam in the world with its estimated 75,000,000 cu. yd. of embankment, exceeding by more than four times that of Denison Dam on the Red River. It will impound at normal pool elevation some 23,000,000 acre-feet of water, inundating 390,000 acres of land and creating a reservoir extending almost to the North Dakota-Montana state line, 200 river-miles upstream.

COLUMBIA RIVER BASIN PROJECT, WASHINGTON

The irrigation phase of the Columbia River Project in south central Washington was started during the year. This project, with its coordinated system of pumping plants, dams, canals, siphons, and related works, is the largest single land development of the Bureau of Reclamation. The world's largest pumps will lift water from the reservoir behind Grand Coulee Dam to be distributed to the southern reaches of the Columbia Basin, 150 miles away. Important developments under way in the Columbia River Basin include the Potholes Dam and the East Low Canal in addition to other projects of minor significance. Potholes Dam will be completed across Crab Creek about 15 miles west of Warden, Wash. It will have a height of 200 feet and a length of 19,000 ft., giving a storage capacity of 615,000 acre-feet.

COLORADO-BIG THOMPSON PROJECT, COLORADO

Considerable progress was made on the various units associated with the Colorado-Big Thompson development of irrigation and power. Tunnels and conduits are built to carry water for use on the eastern plains of Colorado from the eastern end of the 13-mile tunnel under the Continental Divide.

CENTRAL VALLEY PROJECT, CALIFORNIA

The development of the Central Valley Project in California will provide a full or supplemental water supply for more than 2,000,000 acres of highly productive land in the San Joaquin and Sacramento valleys. The total estimated cost of about $400,000,000 classifies this project, along with the Columbia River Basin and the Missouri River Basin developments, as one of the largest programs under way by the Bureau of Reclamation. Construction during the year included work on the 156-mile Friant-Kern Canal and the 120-mile Delta-Mendota Canal.

BULL SHOALS DAM, ARKANSAS

Actual construction of Bull Shoals Dam in north central Arkansas started during the year. The dam will be 263 ft. high, and the length at crest will be 2,394 ft. The dam is part of a project under development by the U. S. Army Engineers to control floods on the White River, and when completed will be the nation's fifth largest dam and reservoir. The ultimate power installation will have a capacity of 336,000 kw.

RIVER DEVELOPMENT, KENTUCKY AND TENNESSEE

An interesting channel improvement was completed during 1946 as one of the various projects under the Tennessee Valley Authority. A 9-ft. channel on the Tennessee River, reaching from Knoxville to Paducah, Ky. joins the Ohio River channel to become a part of the inland waterway reaching Pittsburgh, Chicago, Minneapolis, St. Louis, New Orleans, Houston, and Mobile. It is estimated that, by 1960, savings in transportation costs will amount to $2,000,000 per year more than depreciation of structures, cost of maintenance, and the interest on the investment allocated to navigation facilities. The project included construction of locks, private and public terminals, installation of lights, buoys, and other navigational aids.

BUILDINGS

Construction was started on the new 26-story office building of the John Hancock Mutual Life Insurance Co. in Boston. The building will be 417 ft. high and have an estimated cost of $15,000,000. It will be the highest building in Boston, and from the observation tower it will be possible to view 25 miles to sea and 65 miles inland.

A portion of the steel work has been completed on the 33-story Esso Building addition to Rockefeller Center in New York City. The building will have frontages of 100 ft. and 274 ft. and will be erected at a cost of $6,000,000. The exterior edifice will be faced with limestone with landscaped roof gardens extending along both streets at the second floor level. The structure will be fully air-conditioned.

The U. S. Army Engineers completed a hangar at Eglin Field, Florida, designed to test the largest army aircraft at temperatures between minus 70 and plus 165 degrees Fahrenheit. In addition to the large clearances maintained, the temperature requirements necessitated the incorporation of many unique features into the design. The hangar measures 200 by 250 ft. and has inside ceiling heights of 70 ft. at the center and 35 ft. at the walls. The design of the insulation for the walls includes 13 inches of fiber glass between 1⅝ inch air spaces inclosed by interior and exterior vapor barriers. The ceiling insulation is essentially the same as for the walls, but to protect the steel roof trusses from extreme temperatures, the insulation is suspended from the lower chord members.

A review of the construction of buildings during 1946 would be incomplete without mention of the $800,000,000 hospital building program of the Veterans Administration. At the year's end, construction of the hospitals had not reached the expected volume. As in all other construction activity, the program was hampered by shortages and high costs. Originally, the Administration had planned to place in operation some 76 new hospitals by the fall of 1948, but now it is predicted that construction of many of the projects will run into 1950.

ANACOSTIA RIVER BRIDGE, WASHINGTON, D. C.

Foundation work on the Anacostia River Bridge in Washington, D. C. continued during the year. Floating caissons, fabricated at Wilmington, Del. and towed to the bridge site, were used in the pier construction. Concrete ballast was poured into the floater after it was moored in position, causing it to sink until about five feet of freeboard remained. The remainder of the sinking was accomplished by successive cofferdam attachments and concrete pours. Each pour was followed by excavating material from within the caisson with clamshell buckets.

ARKANSAS-MEMPHIS BRIDGE, MEMPHIS, TENN.

The construction of the Arkansas-Memphis Bridge across the Mississippi River at Memphis, Tenn. progressed slowly during the year because of material shortages and high costs. Work on the seven main piers and the Memphis abutment progressed on schedule, but it was generally agreed that the bridge could not be completed within the original three-year estimate under present conditions.

GRASSE RIVER BRIDGE, MASSENA, N. Y.

The new Grasse River Bridge, near Massena, N. Y. was completed, consisting of seven deck plate-girder spans, one of 90 ft., four of 100 ft., and two of 75 ft. The bridge was designed for E-60 loading and will carry the freight traffic of the Massena Terminal Railroad which connects the New York Central Railroad and the Canadian National Railway with the industrial district of Massena.

One of the 100-ft. spans is constructed entirely of aluminum alloys. As the first aluminum railroad bridge, it will serve to answer certain problems of design, production of materials, fabrication, and behavior in service which can be solved only by building an actual bridge. Direct comparison can be made between the behavior of the aluminum span and the adjacent steel spans of equal length. Reduction in weight made it possible to complete the assembly of the aluminum span in the shop and to transport it in one piece, eliminating all field assembly.

The aluminum alloy selected was 17S-T because it combines the advantages of high strength, good resistance to corrosion, adaptability to the manufacture of large plates and rolled shapes, and working characteristics suitable to standard fabricating practices. The alloy has been used also in airplanes and in the floor system of some U. S. Army pontoon bridges. The low modulus of elasticity demanded that special consideration be given to parts subject to buckling. The aluminum girders were made deeper than the adjacent steel spans to reduce the increased live-load deflection, resulting from the low modulus of elasticity.

BRONX-WHITESTONE BRIDGE, NEW YORK

Work was carried out in the program to stiffen the Bronx-Whitestone Bridge and widen its roadway according to plans which were prepared in

1941. This suspension bridge as completed in 1939 embodied the use of relatively flexible plate stiffening girders. The depth-to-span ratio of these girders was 1 to 209, making it at that time the slenderest of comparable structures, except the George Washington Bridge. The bridge has proved amply rigid under traffic, but studies carried out in 1940 indicated that additional stiffness would be desirable.

The adopted scheme for stiffening the bridge consisted of the addition of a stiffening-truss, top-chord and web members, above and in the plane of each girder. This addition will increase the original rigidity by about 60 per cent and thereby provide a degree of stiffness which will be close to that of several existing suspension bridges known to have very small noticeable oscillation under wind action.

OTHER BRIDGE PLANNING

Plans and specifications were almost completed for an 11-mile crossing at the mouth of Tampa Bay in Florida. The project will include nine sections of solid fill connected by open trestles. The longest open span, crossing the main ship channel, will be 800 ft. long and will clear the channel mean high water by about 145 ft.

The plans for two large suspension bridges were nearly completed during the year. After considerable research the design is near completion for the new bridge to replace the Tacoma Narrows Bridge which collapsed in 1940. Plans for an 800-ft. suspension bridge across the Delaware River below the Wilmington marine terminal are being completed. This bridge will provide a clearance of 175 ft. over mean high water.

MECHANICAL ENGINEERING

By Joseph J. Jaklitsch, Jr.
American Society of Mechanical Engineers

GENERAL

The year 1946 witnessed the gradual but progressive changeover from wartime to peacetime production in industry, hampered to some extent by labor trouble and increasing labor and material costs and stringent government controls. Also apparent is the present shortage of engineers caused by the wartime dislocation of the normal supply of engineering graduates. The June, 1946 Committee Report of the American Society for Engineering Education indicated that 337,000 engineers will be needed in the United States by 1950, a net increase of 76,000 or 29.1 per cent over the 261,000 available in 1940 (including about 16,000 unemployed). Since 78,000 are expected to retire, leave the profession, or die, between 1940 and 1950, a total of about 154,000 new engineers will be needed.

ENGINEERS JOINT COUNCIL

In the past year, the Engineers Joint Council, composed of the presidents, junior post-presidents, and secretaries of five national engineering societies, had several projects under way. They included a study of the organization of the engineering profession, a survey of the economic status of the engineer, and a program of international relations.

The study of the organization of the profession has been focused largely on the means of organizing engineers for common purposes in the communities in which they live, but the hope exists that a single over-all national society, which will concern itself with the non-technical interests of all engineers, may eventually be organized.

The economic status survey is in three parts: (1) A survey of employer practice regarding engineering graduates; (2) a study of the earnings of engineers by a questionnaire sent to 88,000 engineers; and (3) the preparation of a manual on collective bargaining by engineers in professional work.

The international relations program consisted of: (1) The collection of books for the libraries of devastated countries; (2) active cooperation with the various organizations of United Nations; (3) aid in organizing American participation in the International Technical Congress in Paris, Sept. 16-21, 1946, and the Sixth International Congress of Applied Mechanics, Paris, Sept. 22-29, 1946.

The International Technical Congress brought together 1,200 engineers from 50 nations to consider ways in which engineers may be increasingly useful in the major tasks of reconverting a war-torn world to peace and plenty.

A World Engineering Conference embracing all engineering professions was formed at the Congress. This body would work closely with the United Nations Educational, Scientific, and Cultural Organization, and would have as its members a national committee from each nation, which committee would represent that nation's engineering societies.

Conspicuous and important public service was rendered by the engineers of the nation in reports, prepared through the agency of Engineers Joint Council, on the disarmament of Germany and Japan. The recommendations of the German report had an important bearing on the directive of the Allied Control Council for the control of occupied Germany. The Japan report was completed in the spring of 1946 and received the enthusiastic endorsement of General MacArthur.

Another service included the expression of engineering opinion that a division of engineering be included in the Atomic Energy Commission.

THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS

Throughout 1946 The American Society of Mechanical Engineers carried on its activities successfully. The number of members reached a new high of 21,536. Nuclear-energy and gas turbines had important places on meeting programs. The American Rocket Society became affiliated and is cooperating in program making. A Machine Design Group was organized. The Industrial Instruments and Regulators Division of A.S.M.E. held its first national meeting in Pittsburgh, Pa. in coordination with meetings of the Instruments Society of America. A Committee on Nuclear-Energy Application was formed early in the year to stimulate and develop a continuing program of Society activity dealing with the application of nuclear energy. The rush of students to engineering schools is intensifying the problem of the students and student-branch organization.

The Society cooperates in the operation of Engineering Societies Personnel Service, Inc. which has offices in New York, Chicago, Detroit, and San Francisco. During 1945, the service registered 3,561 engineers and placed 828. More than 600 positions were on the books at the end of the year.

APPLIED MECHANICS

The most significant developments in Applied Mechanics were in connection with gas-turbine developments for ship, aircraft, and locomotive propulsion.

A new journal, *Applied Mechanics Reviews,* was authorized during the year by The American Society of Mechanical Engineers and preliminary plans were started for its publication. It is to be a review journal of the applied mechancis literature of the world. It was suggested by the Office of Naval Research and will be published by the A.S.M.E. with the cooperation of the American Society of Civil Engineers, American Mathematical Society, American Institute of Physics, Institute of Aeronautical Sciences, and Society for Experimental Stress Analysis.

The Sixth International Congress for Applied Mechanics was held in Paris, France, Sept. 22-29, 1946. More than 500 attended, of which some 40 were Americans. A new name for the Congress was also adopted. Hereafter it will be known as the Union for Theoretical and Applied Mechanics, and will be incorporated into the United Nations Educational, Scientific, and Cultural Organization.

ATOMIC POWER

During the past year atomic-energy plant construction was completed, and the plants have been operating 24 hours per day and seven days per week; efficiencies have been improved, costs reduced, and plant capacity increased. A recent estimate gave present production as several times that on V-J Day. At the present time the entire operation is under the direction of the U. S. Army Corps of Engineers, through the specially constituted Manhattan District. During 1946 Congress passed the Atomic Energy Act of 1946, and it is under the provision of this act, and under the direction of the commission which it creates, that the entire atomic-energy industry must operate.

The Atomic Energy Commission will inherit the entire atomic empire, including plants, furnished and semi-furnished, bombs, and all other property now held by any government department or agency which pertains to nuclear or atomic processes. It will have sole power over the entire industry, starting with uranium ore in the ground, up to and including finished products containing and produced from uranium. It will also take over all patents, contracts, and secret information and, subject to the direction of the President, it will have sole power for disseminating information and distributing uranium products, including bombs.

The anniversary of the first liberation of large quantities of atomic energy saw active work under way on the construction of an experimental plant to investigate the generation of electrical energy in machinery equipped to utilize the heat energy of controlled atomic fission. The possibility that this method may replace the use of conventional fuels as a source of energy for power generation was recognized and discussed, but this has had no visible effect on the expansion of the facilities for the use of the common fuels in central stations.

The peacetime use of atomic energy in the production of radioactive materials for medical and biological purposes is now under way on a semi-commercial basis. Another important outgrowth lies in the field that has been opened up for the separation of isotopes which may lead to important developments in chemistry and metallurgy.

FUELS

The increasing availability of liquified petroleum gases at reasonable cost encouraged their use as replacement for oil and coal in gasification plant and in some engine applications. Production and distribution facilities for all fuels were taxed by a continued high rate of economic activity with the result that fuel stocks of many kinds were very low and localized shortages were a frequent result of the widespread economic disorder. A notable example of the effect of other shortages on fuels was the limitation necessarily imposed on the efficiency of most gasoline engines by a government limitation on the maximum allowable octane rating of motor fuel because of the shortage of lead for the production of tetraethyl lead.

One notable development in power generation from coal, the result of a number of years of development, is the so-called cyclone burner, described at the December, 1946, Annual Meeting of the A.S.M.E. The device is characterized by simplified auxiliary equipment, extremely low fly-ash emission, and high rates of heat release.

Research on all fuels accelerated. Active work began on the expanded program of the Bureau of Mines on the production of synthetic fuels from coal. Development activity increased on the application of coal to the gas-turbine locomotive under the auspices of a group of railroads and coal companies.

GAS TURBINES

The year of 1946 has seen many veils of secrecy lifted from work being done in the gas-turbine field, both here and abroad. The results of German, Swiss, Swedish, British, and American experiments have been revealed, gas turbine designers and manufacturers have had an opportunity to study prior developments and are now scheduling their own research.

Today the gas turbine is firmly established for supercharging internal-combustion engines, pressurized boiler furnaces, and chemical processes. As a prime mover it has made a definite place for itself in military aircraft and appears to be on the threshold of important commercial aircraft application. Major development programs are under way in the railroad, marine, and stationary fields, and a number of experimental and commercial units have been built.

Much information has been released on constructional materials for gas turbines, and various hydrocarbons are being investigated for their possible use as gas-turbine fuel. Of special interest in the last-mentioned category is the work being carried on investigating the burning of pulverized coal in the locomotive gas turbine. Also in the locomotive field, Brown Boveri has announced its tests of a 4,000-hp oil-burning locomotive gas-turbine unit. For ship propulsion, several developments are under way sponsored by the Navy.

The marine gas turbine, as built by the Elliott Company, is continuing development. It is interesting to note the work being done at the Annapolis Testing Laboratory on an experimental 3,500-hp unit built by the Allis-Chalmers Manufacturing Corporation which has already completed extensive tests at 1,350 F and has been at gas inlet temperatures as high as 1,500 F. The General Machinery Corporation also has a machine under development. All three consist of an air compressor, combustion chamber, and gas turbine, and the three schemes differ from each other mainly in their air compressor. With the Allis-Chalmers machine the air compressor is an axial turbocompressor; with the Elliott Machine it is a screw-type direct displacement compressor, while the General Machinery Corporation employs a "free-piston" compressor.

A 2,000-hp oil-burning gas-turbine generator set has been built by Westinghouse Electric Corporation, and the design features of its major components and a progress report of its operation were discussed at the Annual Meeting of The American Society of Mechanical Engineers held Dec. 2-6, 1946. Dr. Adolf Meyer, of Brown Boveri, Switzerland, announced at this meeting a new device, called the "comprex," which greatly increases the compression ratio, efficiency, and output of the gas turbine. It will be applied to the gas-turbine locomotive. Great interest in rockets and jet-propulsion was evidenced by numerous papers presented.

In the aircraft field, turbo-jet gas turbines are being developed by many firms, and rapid progress is being made. Again the various schemes differ mainly in the type of compressor used. There are multistage axial-flow turbocompressors as well as one- or two-stage centrifugal compressors in successful operation, while a free-piston compressor is in an advanced stage of development.

HEAT TRANSFER

A number of advances in the theory, basic data, and application of heat transfer was accomplished during 1946. On the subject of thermal conduction, a mathematical analysis of the temperature distribution during high-speed welding was completed, and charts were presented to facilitate analysis of temperature distributions in transient heating of solids, particularly for induction heating. Information on the transverse heat flow through laminated metal sheets was also presented.

On the subject of forced convection, additional experimental and theoretical information on the effect of a number of the many design variables in shell-and-tube heat exchangers was provided. Certain fundamental relationships involved in the problem of cooling and heating by means of molten metals, such as sodium and mercury, were treated theoretically.

Heat transfer between hot gas streams and granular solids, a process of great importance to the chemical industry, was studied.

Heat-transfer problems in aircraft were given much attention, particularly by aircraft manufacturers. Progress included not only practical improvements and greater knowledge in the usual problems of engine cooling and in passenger comfort, but also important advances in problems arising in jet-propelled aircraft and in use of heat for anti-icing. For jet engines, new thermal insulations were developed, resistant to high temperatures but of light weight. For prevention of ice deposits on airplane parts in adverse weather, the method utlizing heated air flowing inside the leading edge of the wing was adopted commercially on a production scale, and much pertinent information on that subject was disclosed, including consideration of ice prevention on windshields and radar equipment.

On the subject of radiation, information was provided on improvements in the design of infra-red ovens used for drying, particularly of painted surfaces, and successful application of such methods to drying of gunpowder was described. Improved equipment for use of gas for radiant heating of ceramics was also described and new designs of orchard heaters were proposed.

Thermal measurement methods continued to be developed and improved. Information was disclosed on techniques useful for study of ice prevention problems, and improvements were made on a device that allows a simple direct measure of the heat lost through the walls of buildings. Information on various new forms of a temperature-sensitive electrical-resistance element, for a wide range of usefulness, was also disclosed.

HYDRAULICS

Manufacturers of hydroelectric equipment have been relatively busy since 1941. The anticipated drop in consumption of electricity at the end of the war has not occurred. In many cases there are increases.

With the increase in the cost of labor and fuel, such as coal, existing hydroelectric developments have become more valuable; their generating capacity is not endangered by such interruptions as railway and coal miners' strikes.

Private interests again are beginning to construct hydroelectric projects. Notable among these are the Idaho Power Co., the Southern California Edison Co., New England Power Co., and the Pacific Gas and Electric Power Co.

In the government agencies the Bureau of Reclamation is proceeding with several major projects. Six of the 150,000-hp units at Grand Coulee are in operation, three additional units are partially constructed, and three additional units have been ordered.

The Tennessee Valley Authority has ordered two additional units for existing plants and has also resumed work on the Wautaga project. The Army engineers have released several postponed projects.

The Bureau of Reclamation has ordered six of the pumping units for the Grand Coulee Irrigation system. These pumps are driven by 65,000-hp motors and are the largest pumps ever planned not only in this country but, it is believed, in the entire world.

In technical developments the increased use of welding in hydraulic turbines is important. Not only in spiral casings but also in such items as stay rings, top plates, and even fabricated runners has welding become common.

Improvements in the sensitivity and accuracy of hydroturbine governors have resulted in a considerable amount of replacement where old and obsolete governing equipment is being discarded and newer and more modern is taking its place.

INTERNAL-COMBUSTION ENGINES

There have been several important developments in the field of internal-combustion engines. Of major interest is the commercial development of the dual-fuel or gas-Diesel engine, a unit capable of burning either oil, gas, or a combination, on the Diesel cycle, with instantaneous automatic transfer from one fuel to another. The dual-fuel principle has been applied to 2-cycle as well as 4-cycle engines, and dual-fuel engines can be supercharged.

The art of supercharging Diesel engines has made rapid strides. For 4-cycle engines supercharging has become accepted practice in the marine and railroad fields where savings in engine size and weight are important. Exhaust-gas turbo-supercharges boost engine output anywhere from 30 to 50 per cent, supercharging pressure being about 4 psi.

STEAM POWER

In the field of steam power, no revolutionary developments have been made. Steam temperature has increased steadily, if slowly, and the 900 to 950-F range is no longer considered advanced. Several large plants to operate at 1000 F steam temperature are now under construction. At the same time operating pressures most commonly used have dropped to the 800 to 900-psi range. This does not represent a step backward, however. Most of the plants built before the war were "superpositions," and in such cases pressures of 1200 to 1500 psi proved most economical. Most of the central stations which could be "topped" have been, and present utility-plant construction is mostly new condensing plants. In such plants, which will be more efficient at the low-pressure end, the economical pressure level works out at 800 to 900 F.

The standardization of steam turbine sizes has been brought about by a joint committee organized by the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. Six sizes of turbines between the ratings of 11,500 kw and 60,000 kw have been decided upon.

Recent advances and improvements of power generating and power consuming equipment have qualified the heat pump to play an important part in industrial heating and cooling applications because of its inherent characteristics for efficiently converting waste or otherwise unused natural heat into a more useful form.

A new method of steam production, permitting operation on poor feedwater or even raw salt water, has been proposed by Mark Benson, designer of the Benson boiler. In this new steam producer, all evaporation takes place outside the furnace zone, and all heat-transfer surface is in economizer and superheater sections. Demineralization and degasification of feedwater is carried out in units comprising standard elements arranged in a unique fashion. Elements of this steam producer have been tried out on a pilot scale, but no full-scale construction has yet been attempted.

LUBRICATION

Considerable work has been done in the direction of investigating the utility of silicone fluids as substitutes for petroleum lubricants. Such properties as low-viscosity, temperature slope, nonvolatility, and low freezing point—all very desirable in a lubricant-combined with the heat stability, oxidation resistance, and general chemical inertness of silicones—indicate that silicone fluids would make almost perfect lubricants for any sort of application.

MANUFACTURING TECHNIQUES

Probably the most important single factor in the development of machines and machine tools in the last year was progress in the development and application of carbides to the metal cutting industry.

While carbides were first developed in Germany, their development and use in this country was expedited by the necessity of increased production created by the war. Most prominent in the usage of carbides was their application to milling cutters.

A reduction in the number of teeth on the milling cutters, coupled with vastly increased feeds and speeds, increased production far beyond the limitations set by the standard high speed steel cutters.

The use of carbides also brought about the development of the inserted-tooth cutter and the incorporation of sufficient weight in the cutter body to produce a certain flywheel effect.

Carbides were also successfully used for single-point tools for turning and boring. They were especially applicable for operations on heat-treated and hard surfaced materials.

Carbides were responsible for the development of negative-rake tools and the perfection of a high degree of surface finish coupled with extreme accuracy. In many cases, the use of carbide tools eliminated the necessity for finish grinding the product.

During the development of carbide tools, it was found that the effectiveness of this cutting material depended largely upon the rigidity of the machine on which they were applied. Under war conditions, the machine-tool builders were seriously restricted in the development of machines of sufficient power and rigidity to handle carbide tools to the maximum of their capabilities. The increased speeds and feeds demanded greater horsepower, and the reduction in the number of teeth and the consequent shock called for more rigid machines. As a result, much of the equipment now in use is inadequate where high production is a requirement. These factors are recognized by the machine-tool builders who, freed from restrictions, will, in many cases, redesign their machine tools with the requirements of carbide tooling in mind.

The application of carbide cutting tools has brought about a consideration of the application of additional flywheel effect on milling machines. This, however, is still a controversial subject. Research on the use of flywheels has shown that no definite procedure can be followed. Numerous variable factors enter into the application of a flywheel to each individual job, with the result that, far from being a panacea for all troubles, the flywheel can only be applied effectively after an intensive study of the particular machine and the particular application involved.

Beginning with the July, 1946, issue, The American Society of Mechanical Engineers now publishes *Metal Cutting Data.* This publication is intended to keep the reader in touch with new developments, metal cutting tools, and methods by which production is being increased.

MATERIALS HANDLING

The problems of materials handling has been brought forcibly to everyone's attention, and because of increasing material and labor costs, broad programs have been started in this field in order to answer the many problems confronting users of materials-handling equipment. Work is commencing on the standardization of shipments on skids and pallets. Suggested standards for the small machine and equipment models now often used in plant layouts have been developed. At the suggestion and with the active cooperation of the U. S. Navy, work on the standardization of machine and equipment templates has been started.

METALS ENGINEERING

The past year was a period of reorganization in industry, resulting in a widespread adoption of methods and techniques developed during the war for metal parts fabrication.

Precision casting methods have been adopted for heat resisting alloy parts. Expanded knowledge of methods of de-gassing light alloys has greatly improved the quality of aluminum and magnesium alloy castings. The use of special risers and exothermic materials has resulted in improved soundness of castings, particularly steel and bronze castings. The technique of powder metallurgy has been made available to industry.

By combining press blocking and hammer finishing procedures, magnesium alloy forging production has been facilitated. The recently installed 18,000-ton press at the Wyman-Gordon Products Corporation in Grafton, Mass. is the largest press in the country and will be available for the production of large light alloy forgings which were previously unattainable. The use of precast multiples and direct cast billets as forging stock has resulted in more economical forging production in many cases.

By using die-making practices developed by the aircraft industry, there have been appreciable savings in the cost of manufacture of cold-stamped products.

Electronic controls in arc welding and gas cutting have improved the quality and precision of these operations. The gas shielded arc welding processes have made possible very high quality welds in magnesium and aluminum alloys and stainless steels. The development of the gas pressure welding process for heavy sections makes possible the welding of an economical combination of castings, forgings, and rolled or extruded shapes to produce metal structures.

The use of shot peening and flame and induction heating processes for improving the dynamic strength of metal parts is one of the most significant developments in the metallurgical aspects of design.

One of the very encouraging developments in metals engineering is that industry and the engineering schools have realized the need for more thorough and fundamental training in this field and steps are being taken, particularly by the casting industry, to cooperate with the engineering schools to help provide this training.

RAILROADS

Despite the fact that 90 per cent of the country's railroad freight is being handled by the steam locomotive there is a definite trend to the Diesel-electric locomotive in not only freight but passenger service at a rate limited principally by the manufacturers' ability to meet the carriers' ordering requirements. On Sept. 1, 1946, locomotives on order totaled 556, of which 69 were steam, six electric, and 481 Diesel-electric. This compares with a total of 512 locomotives on the same date in 1945 which consisted of 107 steam and 405 Diesel-electric.

Welded locomotive boilers are now being built for the first time in United States railroad-equipment history by the American Locomotive Co. This development climaxes nine years of experimental operation of a welded boiler installed on a locomotive of the Delaware and Hudson Railroad. The boiler has been completely free of leaks during this period, and all of the welded seams are said to be still in perfect condition.

During the year several manufacturers introduced new models of road Diesel-electric locomotives.

A new 6,000 hp all-purpose locomotive has been built by Alco-G-E for the Santa Fe Railway System. It consists of three cabs, each having a single 2,000-hp turbo-supercharged, 1,000-rpm, V-type, 16-cylinder Diesel engine. A companion to the 6,000 hp locomotive is a 4,500 hp, 3-cab freight locomotive.

The Electro-Motive Division of General Motors Corporation started production of the F-3 basic General Motors Diesel Locomotive, which by a simple change of gear ratio between traction motor and driving axle can be equipped to excel in seven categories from that of the heaviest lugging mountain freight locomotive up to that of a heavy-duty passenger locomotive with top speed of 100 miles per hour.

The Ingalls Shipbuilding Corporation has manufactured a 1,500-hp road-switching locomotive utilizing a 660-rpm, 1,650-bhp supercharged Superior Diesel engine.

Probably the largest Diesel-electric yet purchased is an 8,000-hp, 4-cab locomotive being built by Fairbanks, Morse and Co. for freight service on the Kansas City Southern Lines.

A 3,000-hp single-cab unit has been built by the Baldwin Locomotive Co. for the Seaboard Railroad. Mounting two 1,500-hp supercharged 4-cycle De La Vergne engines, it is the largest single cab Diesel-electric built to date.

The trend in the design and fabrication of passenger equipment leaned toward streamlining, welding *versus* riveting, use of lightweight high-tensile structural materials, air-conditioning, use of plastics for trimmings, antifriction journal bearings, individual or double bedrooms versus open sections in sleepers, fluorescent lighting, and numerous other improvements.

In the fabrication of freight equipment, developments utilizing lighter weight materials, increased volumetric capacity, occasional use of tubular axles, and compensating brakes have been common.

To expedite discovery of "hot boxes" before the danger point is reached, especially in passenger service, several devices have been developed which give visible, audible, or olfactory warning when journal-box temperature exceeds a safe figure.

The Locomotive Development Committee of Bituminous Coal Research, Inc., continued its activities aimed at the development of a bituminous coal-burning gas-turbine power plant for locomotive use. Work is being processed on the development of a suitable coal-handling and coal-pulverizing system, and a combustor arrangement to provide gas of suitable cleanliness for feeding to a gas turbine.

The Committee has placed orders with turbine manufacturers for two turbine-compressor-generator power plants of 3,750 hp each. One plant will include an axial-flow compressor, while the second will utilize a centrifugal compressor. Conventional direct-current electric drive will be used in adapting these units to locomotive use. It is expected that each of the locomotives will develop 3,000 hp at the rails.

MATERIALS

The demands for stainless steels continue to increase. It is estimated that 1946 production will exceed or at least equal that of 1945. Of all stainless steel produced, the chromium-nickel types comprise more than two thirds of the total.

The need for materials to withstand the exceptionally high temperatures of jet and gas-turbine engines has given great impetus to the development of so-called "super-alloys" for high-temperature service, and as the demand for such engines becomes popular, a considerable market for these materials may be anticipated.

Industry is paying increasing attention to the engineering characteristics of alloy irons. Of note are the high-strength gray cast irons containing 1½ to 5 per cent nickel which are being used in Diesel-engine crankshafts and cylinder liners and for aircraft piston rings. Strengths up to 100,000 psi are being obtained.

A new cupro-nickel-aluminum bronze containing 12 per cent nickel, 0.6 per cent iron, 1.0 per cent manganese, and 1.5 per cent aluminum combines superior resistance to salt-water corrosion and excellent mechanical properties, including 85,000 to 95,000 psi tensile strength.

There has been a marked expansion in the peacetime use of iron-nickel alloys possessing specialized thermal expansion properties as a result of more general use of automatic controls in electrically operated and temperature controlled products. The thermostatic bimetals ordinarily used to actuate these devices employ alloys containing 36 to 42 per cent nickel for the low-expansion side and a variety of alloy types containing 20 to 70 per cent nickel for the high expansion side.

A strong trend toward the use of nickel, Monel, Inconel, and other high-nickel alloys for consumer products has become widely evident.

A broad series of standard triple alloy steels containing nickel, chromium, and molybdenum, in which all the significant alloying elements are made under precise control, have become available to industry as a result of wartime experience.

The number and variety of new and lighter products of magnesium, lightest of all structural materials, is constantly growing. Magnesium is now free from government control and is available for civilian uses.

PLASTICS

Probably the greatest advance in plastic materials during 1946 was made in the field of thermoplastic vinyl polymers. While most of the vinyl resins were produced for the usual processes of compounding, extruding, and calendering, there were other forms of resin polymers appearing, such as latex, pastes, or "Plastisols," and "Orgonosols." All three of these are fluid types and are used for the formation of sheet, film, or surface coats without the use of ordinary extrusion and calendering equipment.

Polystyrene became available in much larger quantity. However, no outstanding technical improvements were noted although progress was made in its technique of control, compounding, and fabrication.

A copolymer of styrene was introduced, called Plexene M, which has the water-resistance of polystyrene and is superior in its strength, toughness, solvent resistance, and resistance to weathering.

Methyl-methacrylate was found to be in larger demand both as fabricated from sheet and as molded. Polyethylene, because of its flexibility, toughness, lightness, and moisture resistance is in peacetime demand for use in extruded film and foil and for molded articles. Polyfluoroethylene was announced under the name of Teflon. It is an extremely stable compound, unaffected by acids, alkalies, solvents, water, or temperatures up to 300 C.

In the field of polyamids, some new forms of Nylon became available in limited quantities. Most interesting are the leather-like flexible sheets or molded products and the thin film or foil.

In the field of polyesters there was further development of resinous plasticizers and of unsaturated alkyd resins to be used in combination with a vinyl monomer (usually styrene) for the production of low-pressure laminates.

In the field of cellulosic plastics, the use of gel lacquers from cellulose acetate butyrate was disclosed. Also cellulose propionate was produced in substantial quantities.

In the field of thermosetting condensation resins, the melamines, ureas, and phenolics, there were changes in formulation brought about by the shortage of certain raw materials.

Significant developments during the year of vulcanizable elastomers included combinations of synthetic rubber with various plastics, such as Buna N synthetic rubber with vinyl chloride polymers and with phenolic resins. The silicone resins underwent considerable development and study. They are beginning to find commercial applications not only as electrical insulating materials and bonding agents but also as lubricants and elastomers.

Additional work on materials is reported, including starch ethers, improved ion exchange resins, new furane resins, some work on protein resins, discussion of plastic properties as a function of molecular structure, reports of resistance plastics to bacteria, fungi, and insects.

One of the most notable advances in the plastics industry was the broad and general adoption of high-speed transfer molding of thermosetting materials with the aid of high-frequency electronic preheating.

RUBBER

Government release of the natural rubber for tire manufacturing was the single most important event to the industry during the year. It is claimed that the tires being produced now, with the increased percentages of natural rubber and the improved synthetics, along with the numerous other advancements, are superior to prewar natural rubber tires.

Phenolic plastic resins are reported to blend with synthetic rubbers to produce adhesives of outstanding quality. Research on synthetic rubber and latex already has reached the stage where new molecule building is almost a daily occurrence.

Recent reports have referred to research development of a new white reinforcing material which functions in much the same manner as does present-day carbon black by embellishing the physical properties of a vulcanizate.

Much has been reported this year

on the physical chemistry of high polymeric systems.

Research work on vulcanizing agents has unfolded an entirely new class of non-sulphur halogen compounds beneficial to GR-S.

Approximately 80 experimental polymers were put into worthwhile production in 1946. These polymers were developed for all kinds of end products. Many of these experimental types were modifications of butadiene-styrene copolymers, resulting from the use of new emulsifiers and coagulants.

In extensive production are a whole new set of high heat-resistant elastomers. Some of these withstand continuous temperatures of 300 F and endure temperatures of more than 500 F for 8 to 10 hrs. They can also be used effectively at temperatures as low as minus 70 F.

Forward strides have been reported in transfer and injection molding. New innovations in continuous Buna S preparation and continuous coagulation of Hevea latex have also been reported.

The report of the discovery of an entirely new class of non-sulphur vulcanizing agents for the butadiene-styrene copolymers has been of tremendous interest to the rubber industry's compounding chemists.

Carbon blacks, the mainstay reinforcement for synthetic and natural rubbers, have been improved and further studies have been made to aid compounders in their problems of mixing stocks and bettering the vulcanized properties.

INSTRUMENTS

After the war's end, important servomechanism theoretical and design material was declassified and so made available for control. The frequency analysis approach is most useful, especially the Nyquist test for stability. From the servomechanism field came the parallel-T networks so useful for offsetting the unstabilizing effects of resonant peaks.

Computers of various sorts have likewise made considerable progress from their differential analyzer predecessors. Some of the modern computers continuously use the answer as it is obtained. This basically follows the servomechanism or control approach of continuously eliminating the error in a dynamic system.

Cross-fertilization of instruments from different fields has opened up many post-war potentialities. For example, a trend appears to exist toward making panel instruments coordinated to be readable at a glance, as far as detecting any indication which is out of line. There has been a deep penetration of the industrial instrument field by electrical instruments, especially for central-control installations using telemetering.

REFRIGERATION

Refrigeration received a great impetus during the war as exemplified by its application to many new uses in industrial plants, food industry, and transportation, especially those involved in shipping perishables overseas to millions of the armed forces.

The first post-war year has seen the beginning of many civilian applications of methods developed during the war, the most advertised of these being the home freezer. The greatly increased public interest in frozen foods has also resulted in their handling by approximately 40,000 retail outlets. The volume of frozen foods sold represents, however, only about one per cent of all the fresh produce sold.

Domestic refrigerator production has not yet reached pre-war levels, but new models are designed to fit into complete streamlined kitchens and include compartments for storing frozen foods.

Among industrial applications may be mentioned the experimental plant of the National Advisory Committee for Aeronautics, Cleveland, O., in which great masses of air moving at high velocities for testing airplanes can be cooled in short periods of time from 200 F to subzero levels.

The war stimulated research into the better production of low-temperature gases such as oxygen and helium, and new machinery is now available to reduce the costs of these commodities. This is also true of liquid and solid carbon dioxide ("Dry Ice").

With the return of peace, many new self-contained air-conditioning units for comfort cooling as well as applications to industry, food processing, and transportation have been developed.

A new engineering quarterly *Refrigeration Abstracts,* was initiated by the American Society of Refrigerating Engineers during the year as a result of a demand for sources of information in the field of refrigeration.

An *Educational Guide to Refrigeration and Air Conditioning Training Facilities in the U. S.* was also published by the American Society of Refrigerating Engineers in 1946.

The widespread interest in refrigeration and air conditioning was clearly exemplified by the All Industry Show held Oct. 29—Nov. 1, 1946. Cleveland, O., participated in by more than 200 exhibitors and attended by 20,000 persons.

HEATING, VENTILATING, AND AIR CONDITIONING

Progress in heating, ventilating, and air conditioning in 1946 was characterized by slow and painful but noticeable advances on many fronts rather than by any spectacular single development.

The heat pump (reverse refrigeration cycle) received considerable recognition. Plans were under consideration for the purchase by utilities of 1,000 heat pumps for house heating and 10,000 units for hot water heating in order to provide additional data and experience. Investigations of this device were under way by the Southern Research Institute and Armour Research Foundation, and two manufacturers have introduced such units commercially.

The University of Illinois, as part of its small homes research, completed a one-story 5½ room house in which various phases of warm air heating will be studied. The Bureau of Mines announced development of a stoker-fired hot water heater burning sub-bituminous coal. A study by the U. S. Weather Bureau indicated that the trend toward warmer weather in the United States, which began 41 years ago, apparently reversed about 1936 and that we may now be on the upward scale of a cycle tending toward colder winters and cooler summers.

Research at Purdue University, where two houses, identical except that one had 12 per cent of all area in glass and the other 22 per cent, indicated that a 9 per cent saving in heat requirements would result from taking advantage of the sun's heat.

The installation of radiant heating in a midwest industrial plant was announced. Progress was made in the Pacific northwest in the use of electric cable for radiant heating although this method is still only practicable where electric rates are exceedingly low. Additional manufacturers introduced baseboard radiators designed to replace the conventional baseboard, the object being to make heating equipment in the room practically invisible.

Virtually smokeless coal-burning furnaces and stoves developed at the University of Illinois are expected to be available in 1948. A midget-sized furnace burning gas was announced late in the year by a company which had developed a gasoline-burning airplane heater and which is now adapted to room heating. Not much larger than a suitcase, it is said to be capable of heating two and a half rooms.

The American Society of Heating and Ventilating Engineers, which has conducted research in its laboratory since 1920, purchased its own building in Cleveland, O., for use as a laboratory and moved there during the year. Among the 1946 results from this organization's research is a new friction chart, badly needed for duct design, and new data on friction loss in exhaust hoods. Twenty-two projects are under way.

A house utility unit produced as a prefabricated package and which provides space and water heating, plumbing, refrigeration, kitchen, and bathroom facilities was placed on the market.

The National Bureau of Standards, during the year, released information on heat loss through slab floors and conducted studies on baseboard radiators. Battelle Memorial Institute conducted extensive surveys on the desirability of district heating.

In transportation equipment, air conditioning in varying degrees was provided for a number of new and modernized passenger vessels and late in November, 1946, a completely air-conditioned liner, the *S. S. Del Norte,* made its first trip from New Orleans to tropical east coast ports of South America.

A 17,000-ton heavy cruiser *Salem* was under construction at Quincy, Mass., and it will be the U. S. Navy's first fully air-conditioned warship. In June, 1946, work was begun on sealing and dehydrating with dehumidification equipment approximately 2,200 Navy vessels to prevent the ships from rusting while idle. Air conditioning was applied to the Lockheed *Constellation* to overcome heat generated in the cabin and to offset skin friction of the plane moving through the air at high speeds. Two types of air-conditioned buses, one inter-city and one intra-city, were placed in service during the year. One hundred air-conditioned trolley cars were ordered for Atlanta as a result of experimental work during the preceding year. A new railway passenger coach with full air conditioning was shown in September, 1946, by a railway-car manufacturing company. Each car system is complete in itself and operated by a power take-off from car axles. An electronic air cleaner designed for railroad-car installations was placed on the market.

STANDARDIZATION

An intensified program of standardization was started. Progress continued toward agreement between Great Britain, Canada, and the United States on a series of standard screw threads. The principal point of difference, the angle of the thread, has been settled by the adoption of 60 degrees.

During the year three American Standards in the mechanical field have been approved. These are The American Standard, Gear Tolerances and Inspection, The American Standard, Life Tests of Single-Point Tools Made of Materials Other Than Sintered Carbides, and the third American Standard approved is for involute splines.

Upon recommendation by the Mechanical Standards Committee of the American Standards Association, the Standards Committee has approved the initiation of a new project, namely, a number system for antifriction bearings.

ELECTRICAL ENGINEERING

By HARRY SOHON
ASSISTANT PROFESSOR, UNIVERSITY OF PENNSYLVANIA

SCOPE

This section describes some of the new developments in the field of electrical engineering. It represents a cross section of the field, including some of the small projects as well as some of the larger ones, some of the unimportant innovations as well as some of the momentous improvements. The fields of radio and sound equipment are covered in separate sections, and therefore developments in these phases of electrical engineering are not included here.

PRIZES AND AWARDS

Philip Sporn, executive vice-president and chief engineer of the American Gas and Electric Service Corporation, New York, was awarded the Edison Medal for 1945 by the American Institute of Electrical Engineers.

This medal is the highest award made by the Institute and was presented to Mr. Sporn at the convention in January 1946 "for his contributions to the art of economical and dependable power generation and transmission."

The Hoover Medal for 1945 was awarded by the American Institute of Electrical Engineers to W. H. Harrison, vice-president in charge of operation and engineering, American Telephone and Telegraph Company, "who in times of peace has been devoted to his civic services and effective in his recognition of the essentials of human betterment, and who equally in times of war, inspired by the same ideals, has generously served his country."

David C. Prince, vice-president, General Engineering and Consulting Laboratory, General Electric Co., received the Lammel Medal of the American Institute of Electrical Engineers at the Summer Convention held in Detroit during June 1946. The award was made for "distinguished work in the development of high-voltage switching equipment and electronic converters."

The Washington Award was presented to Dr. Vannevar Bush in recognition of devoted, unselfish, and preeminent service in the advancement of human progress. This award is conferred each year by the Western Society of Engineers on the recommendation of a committee representing the American Society of Civil Engineers, American Institute of Mining and Metallurgical Engineers, American Society of Mechanical Engineers, and Western Society of Engineers.

David E. Harris, vice-president of the General Electric Supply Corporation in charge of Pacific Coast operations was awarded the 1945 Medal for cooperation given under the James H. McGraw awards for electrical men. The award was made to recognize Mr. Harris' 40 years of participation in nearly every cooperative activity on the Pacific Coast.

The John Fritz Medal was awarded to Dr. L. W. Chubb, director of the Westinghouse Research Laboratories, "for pioneering genius and notable achievements during a long career devoted to the scientific advancement of the production and utilization of electrical energy." The medal is awarded by the four national engineering societies.

NEW PROJECTS

Central Arizona Light & Power Co.—Among the new projects inaugurated during 1946 are the following: The Central Arizona Light and Power Co. is spending $2,750,000 for additional facilities. These are intended for the steam-electric plant near Phoenix. A 33,000-kw unit will generate 12,500 volts and will be driven by a 3,600-rpm turbine. A gas and oil fired boiler will furnish 900 pounds of steam per hour.

Arkansas Power & Light Co.—A $20,000,000 expansion program has been announced by the Arkansas Power and Light Co. New transmission lines are to be built, automatic equipment installed, and transformer substation capacities increased. In addition to these items, the erection of over 3,500 miles of new rural lines nearly doubles the number of farm customers to more than 50,000. In order to expedite this program, the company is making some internal changes that include the formation of an Industrial Development Department to encourage industries to move into the company area. An Agricultural Development Department has been formed to educate the farmers. An employees training program has been started, which includes courses in executive standards, job training, and electronics. A model distribution system is planned for line and maintenance crews to acquire experience in solving practical problems.

Pacific Gas and Electric Co. will add two 100,500-hp turbine generators to the "Station P" steam plant in San Francisco. The units will operate at 3,600-rpm with a pressure of 1,500 psi at 900° F. Steam will be provided by four outdoor boilers each of which will produce 450,000 lbs of steam per hour.

San Diego Gas and Electric Co. is installing a new 50,000-kw steam unit at a cost of more than $5,000,000. It is to be housed at the site of the Silvergate generating plant. The boilers for the unit will be fitted to use either oil or natural gas as fuel.

Connecticut Light and Power Co. is starting a five-year improvement program to cost over $22,000,000. This will include a 45,000-kw turbo-generating unit at the Devon plant. This unit operating at 3,600 rpm will be hydrogen cooled and will generate 13.8 kv. It will be connected through a 50,000-kva transformer bank to a 69-kv outdoor substation. Steam will be supplied by two 225,000-lb per hour boilers at 850 psi and 925° F. In addition to the new unit at the Devon plant, there is to be a 31,250-kw turbo-generator at the Montville station near New London. This will replace two 10,000-kw units. The new generator is to be driven by a turbine supplied by one 300,000-lb per hour boiler at 850 psi and 950° F.

Delaware Power and Light Co. is building a 90,000-kw plant on the Delaware River at Wilmington. The cost is expected to be in the neighborhood of $13,000,000. It will be interconnected with the Deep-water and Chester power plants of the Philadelphia Electric Co. A 66-kv transmission line is being erected to Dover to provide additional power to the Kent and Sussex County area.

Florida Power and Light Co. is spending $24,000,000 on an expansion program. This includes a new plant at Sarasota of 18,000-kw and a new plant at Riviera Beach of 42,000-kw. The program also includes substations, transmission lines, and over 600 miles of rural line.

Georgia Power Co. is building a new steam station on the Flint River near Albany. Two 22,500-kw turbo-generators and two 230,000-lb per hour boilers are to be installed. The generators are hydrogen-cooled, 25,000-kva, 0.9-pf, 3,600 rpm. The boilers are outdoor type supplying steam at 850 psi and 900° F.

Allatoona Dam.—Work has been started on the Allatoona Dam project on the Etowah River near Cartersville, Ga. The dam is to be 190 feet high and 1,325 feet long. The reservoir is expected to contain 722,000 acre-feet of water and to extend for 32 miles upstream. Two 36,000-kw generators are to be installed first, with provision made for an additional 36,000-kw unit later. A 2,000-kw service generator will provide power for station lights and auxiliaries.

Public Service Co. of Indiana is entering upon a $6,500,000 program for expanding its generating and transmission equipment. A 37,500-kw generating unit is to be installed at the Edwardsport station, and at the Dresser station near Terre Haute a new steam generator with 300,000-lb per hour capacity at 650 psi and 915° F. is being installed.

Mississippi Power and Light Co. is investing $20,000,000 in a new program. It includes four new 110-kv lines totaling more than 200 miles in length. There is also to be 1,500 miles of rural lines, adding over 4,000 new rural and farmer customers.

Public Service Electric and Gas Co. of New Jersey is starting a $200,000 plant at Sewaren on Arthur Kill. Two 100,000-kw high pressure units will be installed. The turbines are to be hydrogen-cooled. One boiler will be provided for each unit, and fuel can be either pulverized coal or fuel oil.

Southwestern Gas and Electric Co. is erecting a new plant at Caddo Lake near Mooringsport. It will be provided with a 25,000-kw unit at first and will eventually be increased to four times that capacity. Natural gas is to be used as fuel with the turbines working at 850 psi and 900° F.

Central Ohio Light and Power Co. plans an expansion to cost over $650,000. It will include installation of new steam generating equipment in the Woodcock plant near Bluffton and construction of an additional 34,500-volt line from Bluffton to the Findlay plant. This will give 20,000 additional horsepower to Findlay.

Texas Electric Service Co. is initiating an $8,000,000 project. Some of the features of the project are the installation of a 40,000-kw turbine-driven generator at Handly near Fort Worth and the construction of 50 miles of 60-kv power line to complete the industrial power loop around Fort Worth.

Texas Power and Light Co. plans a $4,000,000 expansion. This will include an 85-mile transmission line from Jewett, Leon County, to Lufkin where a large substation is to be built. About 1,000 miles of rural lines will be added to the system, and the capacity of many substations will be increased to provide for increased services.

Rumford Falls Light and Water Co. is planning to change its distribution from 40 cycles to 60 cycles. The power is generated by the Rumford Falls Power Co. which supplies power to the Oxford Paper Co. and to the Light and Water Co. The paper company will continue to be served with 50-cycle power; the conversion is only for the light and water company. Two 5,000-kva frequency changers are to be used. They consist of three-phase, 40-cycle, 2,400-volt synchronous motors driving three-phase, 60-cycle generators. The output is a three-phase four-wire circuit with 4,160 volts line-to-line and 2,400 volts line-to-neutral.

SWITCHING DEVICES

A novel type of mercury switch known as the Mercu-Trol is now available. An iron plunger is arranged so that its descent displaces the mercury in a reservoir and the mercury rises and completes the circuit between two contacts. If the control is to be normally open, the plunger is allowed to float on the mercury until it is pulled down by the actuating coil. If the control is to be normally closed, the plunger is weighted so that it sinks and must be drawn up by the actuating coil.

A light-weight three-phase circuit breaker has been developed for use on 120-volt 400-cycle systems in planes. The operating solenoids are designed for low current and operate over wide ranges of temperature. The breaker uses high gas pressure and multiple arc gaps. The confinement of the arc to a closed chamber makes the device independent of altitude, and it also reduces the fire hazard.

A sectionalizing switch is now available for use on network secondaries. It contains a current coil that functions as an overload release. In addition there is a voltage coil that is connected across the contacts. When the contacts are closed the voltage coil is short circuited and introduces no losses. In case of a fault, the high current in the current coil opens the contacts. As soon as the contacts open, the line voltage appears across the contacts which energizes the potential coil to hold the contacts open. The contact will remain open until both sides of the contacts are brought to the same potential by replacing the fuse or closing the breaker to the faulted transformer. This arrangement keeps unfaulted transformers from trying to carry the entire load, which, of course, might result in their fuses or circuit breakers opening and interrupting service on the entire system.

A suggestion for post-war house wiring is the use of push-button operated relays in place of customary snap or toggle switch control for house lights. The advantages claimed include the fact that the load circuit is shortened by the omission of the loops required to take in one or more switches. The control is by means of low-voltage relays placed in the circuit where convenient. The relays can be operated by one or more push-button stations without any changes being required in the power circuit wiring. By using low-voltage relays energized from a low-voltage transformer, similar to the bell-ringing transformer, it will not be necessary to enclose the control wiring in BX or loom for common annunciator or bell wire may be used. It will be simple to arrange for light control at each door of each room. In addition a master control panel can be placed in the home owner's bedroom so that any or all of the lights can be controlled from that room. Thus it will be unnecessary to go downstairs to turn out the light that was left burning in the cellar or on the porch by mistake. Furthermore, in case of a burglar's presence being suspected, the lights can be turned on which will generally persuade the intruder to leave.

MATERIALS

During the war, mica became scarce; and therefore the Robert Bosch Co. developed a substitute, which material can be used, for example, between commutator segments. It consists of several layers of impregnated glass fiber, which is impregnated in a vertical machine such as that used for varnished cambric. It is then passed through an oven where it is heated to 120° C and is cooled to room temperature again in about 15 minutes. The material is then cut into strips, and three strips are molded together under pressure and at 160° C for five minutes. After this it is ready for use. The material can withstand 250° C continuously and temperatures up to 320° C for short intervals.

Aluminum as the structural material for substation construction has been found a definite advantage. Such a substation was erected in Erie, Pa. The main advantages are that the aluminum is not corroded by the chemicals in some atmospheres as in the case of steel; therefore, there is no need to paint the structure which, in addition to the labor and material cost, requires some of the circuits to be de-energized for the painters' safety. A further advantage is that the actual erection is greatly simplified because the members are so much lighter. They can be handled much quicker without the need of machinery. The weight of an aluminum structure is about half the weight of an equivalent steel structure.

A new recommendation has been made to the large-machinery manufacturers that they use liquid cooling in the electrical machinery, which cooling is said to be far superior to air or hydrogen cooling ordinarily used. The heat transfer to the liquid coolant and the heat conduction are considerably better than other means. The liquid coolant further tends to equalize the machine temperature so that temperature differences are less with consequent reduction in hot-spot temperature.

COMPUTING DEVICES

An alternating-current calculating board has recently been put into operation at the Armour Research Foundation. It is the fourteenth such board built in the United States. There are three more on order by Agricultural and Mechanical College of Texas, Los Angeles Department of Water and Power, and the University of Kansas. Of the 14 present owners of a-c boards all but five have d-c boards to solve some of the problems. These calculating boards simulate various steady-state conditions on distribution systems. An immense saving is achieved by using single-circuit connections even though three-phase equipment is being simulated. Possible studies include circuit loading, bus voltages, transformer ratings, and capacitor ratings required for power-factor improvement. By making use of sequence circuits, it is possible to predict the effect of various types of short circuits and faults that might take place at different locations in the system. Stability studies can be made by noting the phase angles existing in different parts of the system. Certain types of transient studies are possible even though all measurements are of steady-state conditions. Study of arcing grounds and other similar effects are susceptible of solution with the proper manipulation of circuit voltages. The calculating boards consist of a collection of resistors, inductors, and capacitors, with means for connecting various sized components in different circuit arrangements. Instruments are available to read current, voltage, power, and phase angle in any part of the circuit. The alternating-current board is able to give results in general with greater accuracy than the direct-current boards do. In addition, the a-c board can be used for stability studies and study involving relay action that d-c boards are incapable of handling because there is no way to represent or measure phase angle difference in d-c boards.

A differential analyzer has been bought from the General Electric Co. by the University of California. It is to be housed in one of the new buildings on the Los Angeles campus. It is the sixth instrument of its kind in the United States. The original analyzer in this country was designed by Dr. Vannevar Bush. The older machines have generally been modified to include the improvements made as the art progressed. The machines now use polarized light to activate electric torque amplifiers instead of the original brake-band type of torque amplifier. This and other improvements increase the speed of operation so that satisfactory accuracy is achieved without undue slowness of operation.

MAINTENANCE EQUIPMENT

The Consumers Power Co., Jackson, Mich., has developed a "hot-line shield" that is available for general use. It is made of laminated plastic; the outer layers are duck base and the inner layers paper base. The shield consists of three cylindrical sections: an 8-inch diameter tube that is placed horizontally on the insulator pin and enclosing the live wire; a 5-inch diameter tube is placed around the wire at each end of the pin-covering tube. These three sections will cover about 12 feet of the wire and allow workmen to pass close to the wires and to haul tools and equipment to lines above without the necessity of de-energizing the lower line. Protection is afforded for voltages up to 14,400 volts. This is greater protection than was available with the old types of rubber protectors. It is also found that these plastic shields are simpler to store and service than the rubber shields.

Line crews are called upon to travel from place to place to keep electric power lines in service. Distances covered may be many miles from headquarters and from job to job. Companies are trying to provide better transportation facilities for their crews. One arrangement uses a special cab on the line truck. This cab carries five men in addition to the driver. The main drawback is the increased cost of the truck and the reduced turn-in value because it is a specialized design. Another plan uses a conventional line truck with an extra seat placed in the body of the truck. This proves satisfactory for small crews but not for larger crews of 10 to 12 men. For these crews, the Los Angles Department of Water and Power has provided special buses. Provision is made in the body of the bus for carrying small tools and packages in racks, and the back of the bus is available for carrying tool boxes and larger equipment.

The Public Service Co. of Colorado has found an interesting solution to the problem of maintaining service in regions where travel of repairmen and delivery of emergency material are hampered by snow and ice. A government surplus half-track snow motor is being used in the region where the Shoshone-Denver line crosses the Continental Divide. The half-track is fitted with wheels and skis in front. Either can be used separately or both together. In the latter case the skis are a little higher than the wheels so that the wheels carry the weight if possible, and any tendency for the wheels to sink in and become mired will be prevented by the skis carrying the load. This is ideal where the snow is spotty as a result of drifting winds. Without some such means of transportation the workmen must travel on snowshoes, and it is practically impossible to move any heavy repair equipment until good weather. With this device, the workmen's travel time is cut to a small fraction, and there is no question of holding up repair work because the snow auto can shuttle back and forth with men and equipment at 15 to 20 miles per hour after it has once packed the snow along the road.

The Pacific Gas and Electric Co. has developed a system that has facilitated to a marked degree the location of faults on buried cables having non-metallic sheaths. The scheme is to make resistance measurements first in order to find the approximate location of the fault. Then 10,000-

volt impulses are applied to the cable, and the exact position of the fault is found by means of a sound-pickup device. It was found that a crystal vibration pickup worked very well instead of the conventional microphone.

The Wisconsin Public Service Corp. has solved the problem of Frazil ice at its Bayside Steam plant. There was a tendency for ice to form in the trash racks and block the intake to the condensers. The solution consists of diverting some of the output water into the intake channel to warm the water to 40° F and thus prevent the formation of such ice. When the weather becomes colder Green Bay is frozen over, and it is possible to stop the re-circulation and take full advantage of the cooler water at the condensers.

RECTIFIERS AND INVERTERS

Electronic exciters are becoming more common as time goes on. Rectifiers have been competing with rotary converters and motor-generator sets for quite a while where the load consists of the customary direct-current load such as railway motors, elevator motors, and electrolytic cells. More recently rectifiers have been used as exciters for synchronous motors and synchronous condensers. In one of the most recent applications. rectifiers are used as exciters of large alternators. An electronic exciter has just been installed in the Springdale station of the West Pennsylvania Power Co. It is used as exciter for one of the 25,000-kva generators. It contains a rectifier transformer connected delta-6-phase star. The rectification is carried out by ignitron tubes. The firing of the ignitrons is controlled by means of thyratron tubes so that the rectification can be regulated to provide for variations in the load and terminal conditions.

An unusual frequency-changer installation is in use at the Gary Sheet and Tin Mill plant of the Carnegie-Illinois Steel Corp. The plant has two power systems. One is the 60-cycle public utility; the other is a company owned 25-cycle system. The frequency on the public-utility system is kept within 0.16 per cent, but the company-owned 25-cycle system keeps its frequency only within 6 per cent. Since both of these systems are about the same size it is impossible to use ordinary rotating frequency changers because they would try to force both systems to keep the same frequency deviation and hence would interchange energy between the two systems at the wrong times and in the wrong amounts. It would be possible to use two ac-dc motor-generator sets with the a-c machines in the respective systems and the d-c machines to provide the connecting link. However, it was decided to avoid the use of rotating machinery entirely and use mercury-arc thyratrons in a similar scheme.

There are two 25-cycle thyratrons. Each is connected for 6-phase operation, and if both are used together the combination is 6-phase. There are two 60-cycle thyratrons also. They are each connected 6-phase, but when the two are used together the circuit is made 12-phase. To transfer energy to the 60-cycle system the 25-cycle thyratron acts as a rectifier to produce direct current which is changed to 60-cycle current in the 60-cycle thyratron acting as an inverter. To transfer energy to the 25-cycle system the 25-cycle thyratron becomes the inverter and the 60-cycle thyratron becomes the rectifier. The frequency changer is made self-synchronous by connecting the grids of the 60-cycle thyratron to the 60-cycle system and the grids of the 25-cycle thyratron to the 25-cycle system. Consequently the device can be made to transfer energy in whichever direction is desired for any values of frequencies that exist in the two systems. This frequency changer is rated at 6,667-kw. This figure was chosen as being one third of an eventual 20,000-kw installation. The potential of the d-c link between the two systems is nominally 1,750 volts. At this voltage it is found that a 15-mh reactor is useful as a smoothing reactor. This reactor has a further function in protection.

There are always the possibilities of arc-backs and arc-throughs. The arc-backs are quite rare and generally take place on the rectifier side and cause comparatively little trouble. On the other hand an arc-through is an inverter fault that corresponds to short circuiting the d-c side. The 15-mh reactor is useful here in that it reduces the current build-up rate in case of arc-through so that the protective breaker can interrupt the current before it has become too great if the grids of the thyratron do not regain control in the meantime.

The d-c breaker is of novel design in that it consists of six breakers connected so that three units open one at a time followed by the remaining three together. Each of the first three units insert resistance in the circuit and the last three actually break the circuit. A further matter of interest is the sensitivity of the changer to voltage fluctuations. Only a few per cent change of voltage can produce 100 per cent change in load. For this reason it was found necessary to use electronic regulators because the mechanical types of regulators were found too slow in their operation.

INDUSTRIAL HEATING

Dielectric heating is found to be of great aid in curing and drying rubber. Such materials are poor heat conductors, hence considerable time is required to get the heat to the inner portions when an oven or other conventional system is used. By using high frequency of 6 to 30 megacycles the heat is produced throughout the rubber, and the curing time has been cut in some cases in half, in other cases to one tenth the former time.

Infrared lamps are now being used to dry pottery before it is fired in the kilns. Formerly, "waste" heat from the kilns was used for this purpose. but it is now found that by using infrared lamps the drying time is reduced to approximately one tenth, which means that economies in the other steps are possible to offset the cost of the heating current. It is also found that defects in the pottery show up oftener during the drying process instead of during the baking process, and this means more economical use of the ovens. In an installation of the Buffalo Potteries Co. lamps of 1,000 watts and of 500 watts are used, and the company reports that no lamp failures occurred in over 1,000 hours of operation.

Radio Corporation of America has two new models of induction-type electronic power generators. One is a 2-kw unit using two 833-A tubes in parallel in a Colpits circuit; the other is a 15-kw unit using two 892-R tubes in parallel in a Hartley circuit. For both units a 25-foot cable is provided to connect the oscillator to the applicator unit so that there is considerable flexibility in the use of the units. The frequencies are approximately 400,000 cycles. Plans are under way by the company to add two additional sizes to the list, one a one-kw unit and the other a 75-kw model.

SPECIALIZED EQUIPMENT

A new departure has been made in induction-motor construction. The device is a linear motor. The squirrel cage has been developed to lie flat and extends nearly 1,400 feet in length. The primary is also developed to lie flat but is only a few feet long. It is mounted on a small car that runs on rails on either side of the squirrel cage. The polyphase currents in the primary produce a gliding field that causes the car to run along the track. The device is installed on an airplane runway at Patuxent River, Me.

A gausse meter is now available for checking flux gradients in air gaps and for determining the direction and density of flux in leakage paths. It is in a two-inch case made of textolite and has a hollow bronze exploring prod at the back. It is especially useful in production testing of permanent magnets and for checking electromagnets and relay coils.

The development of types of equipment usable in atomic research was kept secret during the war. Some of these devices are now being publicized. One of these is the betatron, a device for accelerating electrons to immense velocities. The electrons are accelerated while traversing a circular path something like the condition in the more widely known cyclotron. However, there is this fundamental difference, that in the cyclotron the particles are accelerated during two short parts of the circular path by means of electric fields, whereas in the betatron the electrons are accelerated by means of a magnetic field along the entire path. The device is similar to a transformer except that, instead of moving in the secondary winding, the electrons move in a vacuum tube. The electrons are accelerated to their final velocity in one quarter cycle of the magnetic field. By means of adding a constant-current "bias" to the exciting current it is expected to be possible to accelerate the electrons during one half cycle which will give greater velocity with little redesign of the instrument.

The Hartford Electric Light Co. has made a report on the operation of its mercury unit. From the time of installation to the beginning of 1946 the unit was in operation 80 per cent of the time. The 20 per cent unavailability included all causes for either the steam or mercury cycles. The efficiency of the unit can be approximated from the following figures. The heat rate is slightly over 10,000 Btu per kw-hr. However, of each kw-hr output in this figure for the heat rate only 400 watt-hours are in electrical energy, the remaining 600 watt-hours are in steam energy and to find the total watt-hours in electrical energy the 600 watt-hours must be multiplied by the steam-turbine and electric-generator efficiencies.

RADIO

By G. L. Beers

RCA Victor Division, Radio Corporation of America

GENERAL

The year 1946 gave the radio industry its first post-war opportunity to concentrate attention on peacetime pursuits. It can not be considered as a normal year because of the unprecedented demand for radio equipment resulting from wartime production restrictions. On the other hand, material shortages and strikes imposed serious limitations on the types and quantities of units which were produced. The expansion of new broadcasting services, such as frequency modulation and television, was likewise seriously handicapped by lack of equipment and restrictions on the construction of new buildings to house the transmitters and studios.

THE FEDERAL COMMUNICATIONS COMMISSION

In February 1946, Paul A. Porter, Chairman of the Federal Communications Commission, resigned at the request of the President to become Administrator of the Office of Price Administration. Commissioner Wills took office in July 1945, but died suddenly at Brockton, Mass., March 8, 1946. Commissioner Charles R. Denny was appointed Acting Chairman, and Rosel H. Hyde, General Counsel of the Commission, was nominated by the President to complete the unexpired term of Commissioner Wills. In the first week of December, Acting Chairman Denny was appointed Chairman by the President.

The Federal Communications Commission was faced with the greatest volume of work in its history. Wartime restrictions had prevented the licensing and construction of nonmilitary radio communication facilities, and at the end of the war applications for licenses for all types of civilian communication facilities were filed. In addition to the abnormal requests for increases in facilities for existing services, a tremendous interest was shown in the many new services such as FM broadcasting, television, and a variety of special communication services to meet the needs of transportation and other industries.

The general hearings on the allocation of frequencies held during the latter part of 1944, and through 1945, had indicated the desire on the part of industry for frequencies to establish new services. After the announcement of the general frequency allocation by the Federal Communications Commission, it was necessary to proceed with further engineering conferences and oral arguments in order to determine exact divisions and operating and engineering standards for the various portions of the radio frequency spectrum.

FCC HEARING ON CLEAR CHANNELS

Of particular importance to the standard broadcast field was the hearing ordered in January 1946 with respect to the so-called Clear Channels. The standard broadcast band is presently divided into several types of frequency assignments or channels, each for a particular use domestically and by international agreement in the North American region. A few of the channels are for use by local stations and are occupied by a very large number of low power stations, restricting each other by reason of interference to relatively small areas surrounding towns or metropolitan districts. Other channels are designated for the use of regional stations and are occupied by a smaller number of stations with more power, restricting each other by reason of interference to a region which may include a metropolitan district and a considerable portion of the surrounding area. A few channels are to be used by high power stations serving a large part of the country at night. Some of the high powered stations operate on channels on which there are no other stations at night, and these clear channel stations with sufficient power could serve most of the United States because they are not limited by interference from other stations on the same frequency. The issue in the clear channel hearing is the desirability of maintaining a number of clear channels, occupied by high power stations or the breakdown of such channels to permit the assignment of more stations, giving coverage with higher signal intensity but limiting each other in their over-all coverage by reason of mutual interference. Hearings with respect to this matter were held during 1946, and it is probable that a decision will be reached sometime in 1947.

FCC ACTION ON BROADCASTING

As an indication of the Commission's tremendous work load during 1946, there follows a list of the actions taken up to November 1946 in the field of broadcasting:

Standard Broadcasting—	1034 stations licensed
	425 construction permits outstanding
	648 applications pending.
Frequency Modulation Broadcasting—	48 stations licensed
	945 initial authorizations, which includes conditional grants
	281 applications pending.
Television—	7 stations licensed
	38 construction permits issued
	33 applications pending.

INTERNATIONAL TELECOMMUNICATIONS CONFERENCES

In June 1946, the State Department called meetings to review the United States proposals for revision of the International Telecommunications Convention and Regulations. In accordance with the present Convention, the Department sent telegrams to all nations, suggesting that an International Telecommunications Conference be held in the United States, beginning April 1, 1947.

By July 1946, the United States had obtained the agreement of the required 20 nations and was prepared to call a World Telecommunications Conference in this country in April following. At the same time, the Soviet Union invited the United States, Great Britain, France, and China to attend a preliminary Five-

Power Conference. The Five-Power Telecommunications Conference was held in Moscow Sept. 28, 1946 to Oct. 24, 1946. It was planned to permit each Delegation to present the background of its proposals and thus obtain unanimity of thought when preparing final proposals for the International Conference. The Conference was more successful in achieving this end than the United States delegation had expected. It was agreed that a preliminary World Radio Conference be held in the United States beginning May 15, 1947 to permit the engineers to prepare a new allocation table and a new international list of frequencies. The Plenipotentiary Conference will be held in the United States beginning July 1, 1947.

NORTH AMERICAN REGIONAL BROADCASTING CONFERENCE

The North American Regional Broadcasting Agreement, signed at Havana Dec. 13, 1937, expired March 28, 1946. The agreement covered the allocation and use of standard broadcasting frequencies in the North American region. Canada and the United States had proposed that the agreement be extended on a temporary basis because the war had prevented the expansion visualized by the original agreement. Cuba maintained that the facilities granted to her by the Agreement were insufficient and insisted on a conference to propose a new Agreement. The Conference was held in Washington Feb. 4-25, 1946.

Canada, Mexico and the United States, because of their extensive areas, had each been granted a number of clear channels, whereas Cuba, with a limited area to cover, was given only one clear channel. The Cubans did not insist on the assignment of clear channels to Cuba, but objected to the number of frequencies which the agreement prevented them from using. The difficulty arises from the fact that the Cuban broadcasting system involves a large number of stations in Havana, and such stations are so close to the border of the United States that interference would result were they to operate on United States clear channels. The primary purpose of the North American Regional Broadcasting Agreement is to protect stations of each country from interference from stations in other countries. Cuba, requiring only limited coverage, is not seriously affected by interference but is capable of very serious interference to the wide coverage clear channel stations in other countries.

The Cuban Delegation, after threatening not to sign the Agreement, finally obtained the use of 10 clear channels (5 United States, 2 Mexico, 3 Canada). It is generally agreed that this compromise is to the disadvantage of the United States but was accepted rather than face the interference which might result if no agreement were in force. The United States succeeded in having a permanent North American Regional Engineering Committee established to make investigations in the event of interference and to recommend remedial action.

MILITARY RADIO EQUIPMENT

Early in the year the Government released information on the wartime development of air-borne television equipment for military purposes. The two types of equipment known as "Block" and "Ring" were publicly demonstrated in March 1946 at the Anacostia Naval Air Station. The demonstration was sponsored jointly by the Navy and the Radio Corporation of America.

The "Block" equipment consisted essentially of a small light-weight television camera and transmitter. The transmitter operated at a frequency in the region of either 100 or 300 megacycles and had a power output of approximately 15 watts. This equipment was considered to have a reliable operating range of 10 to 15 miles, although satisfactory pictures were frequently transmitted over considerably greater distances. The "Block" camera was designed for mounting in a fixed position, and in flight the orientation of the camera was dependent entirely upon the position of the plane. One of the primary applications of this type of equipment was in guided missiles.

The "Ring" equipment was developed for reconnaissance work and was capable of picking up and transmitting television images over distances of 150 to 200 miles. The transmitter operated at approximately 100 megacycles and had a power output of 1 kw. The "Ring" camera was mounted so that it could be "panned" by an operator and objects held relatively stationary in the picture while the plane was in flight.

An Army radar experiment which aroused considerable public interest was conducted in January 1946. In this experiment high power radar signals were directed at the moon and the reflected signals were successfully received.

RADIO RECEIVERS

The total industry production of AM, FM, auto and television receivers for the year 1946 is estimated at 13,885,000 units. This estimate is based on industry production figures for the first 11 months. Of this total, FM and television receivers accounted for only 175,000 and 10,000 units, respectively. The number of FM receivers produced was seriously limited by the lack of wood and manufacturing facilities for producing console cabinets. Television receivers were not manufactured in any quantity until the fourth quarter. A large majority of the AM sets were table model instruments housed in plastic cabinets.

Receiving tube production for 1946 is estimated as 182,200,000. Approximately 2,822,000 tubes of the non-receiving types were produced.

AMPLITUDE MODULATION (AM) BROADCASTING

During the year the Federal Communications Commission received an unprecedented number of applications for AM broadcasting stations. Of the nearly 400 AM construction permits issued between V-J Day and Sept. 19, 1946, approximately 50 per cent were issued in cities with no existing radio stations as of V-J Day. These cities had populations of 50,000 or less.

The interest evidenced by the newspapers during 1945 in the radio broadcasting business continued during 1946. A specific manifestation of this interest was the purchase of Station WCAU in Philadelphia by the *Philadelphia Record*.

The 24th annual convention of the National Association of Broadcasters was held in Chicago during the week of Oct. 20. For those who could not gain access to the rooms in which the daily sessions were held, a number of television receivers were installed in the exhibition hall. The convention activities were picked up by Image Orthicon cameras and reproduced on these receivers. A considerable portion of the Convention program was broadcast by Television Station WBKB.

FREQUENCY MODULATION (FM) BROADCASTING

The anticipated post-war expansion in FM broadcasting was delayed by the difficulty in obtaining transmitting equipment suitable for operation in the frequency band from 88 to 108 megacycles and by the limitations on new building construction. The Petrillo (AFM) requirement that additional musicians be hired when FM stations carry the same program as AM stations was also a retarding influence.

The Federal Communications Commission as of Oct. 1, 1946 had issued over 500 construction permits and conditional grants for FM stations. Of this number, approximately 75 per cent went to individuals or organizations with interests in AM stations. Thirty-eight per cent of the total had newspaper interests.

Operation in the 88 to 108 megacycle band was begun by a number of FM stations during the year. Some stations, however, continued to transmit programs on the frequencies between 42 and 50 megacycles which were assigned to FM broadcasting before the war. At the end of the year, the FCC ordered those stations which were operating between 42 and 44 megacycles to move temporarily to the 44 to 50 megacycle band and indicated that all FM stations in this band would be discontinued as soon as a reasonable number of post-war FM receivers had been sold.

Two new types of FM receivers were produced during the year. The first type employs a continuously operating oscillator whose frequency is controlled by the frequency variations of the received signal. The oscillator is responsive to frequency variation only and is not affected by amplitude modulation of the received signal. In the second type a special detector-discriminator combination, known as a "Ratio Detector," is employed. The output currents from the two diodes employed in this circuit are caused to flow through a common load resistor. The total voltage across this resistor is automatically held constant. The voltage developed across this resistor by one diode can not increase without a corresponding decrease in the voltage from the other. The variation in potential across either one of the diodes is utilized as the audio output voltage. Amplitude variations in received signals cause the rectified current through the common load resistor to change but does not affect the audio output voltage.

A new tube called the "Phasitron" was introduced for use in FM transmitters. This tube may be employed in the type of FM transmitter in which the phase of the carrier frequency wave derived from a crystal controlled oscillator is varied directly in proportion to the strength of the modulating signal.

TELEVISION BROADCASTING

Early in the year a number of the television stations discontinued broadcasting while equipment changes were made to permit them to operate on the new frequencies to which they were assigned as a result of the frequency reallocations announced in 1945. The operating schedules of most stations were increased during the year although the majority did not meet the FCC proposed minimum requirement of 28 hours of programs a week. The FCC postponed until 1947 the date on which all commercial television broadcasting stations must meet this requirement. On Dec. 1, 1946 there were seven stations licensed, 38 construction permits had been issued, and 33 applications were pending.

During the year the American Telephone and Telegraph Company's coaxial cable between New York and Washington was used to send programs in both directions between the two cities. The Philco Corporation used a radio relay system to rebroadcast in Philadelphia television programs originating in New York. An exchange of programs between the Philco station WPTZ and the NBC station WNBT was instituted toward the end of the year.

Some of the outstanding television programs broadcast during 1946 were sporting events, such as the Louis-Conn fight, the championship tennis matches, and the Army-Navy football game. An estimated audience of approximately 150,000 viewed the Army-Navy game by television. A number of excellent dramatic productions and variety shows were broadcast. Advertising agencies and industrial organizations sponsored numerous programs during the year.

PORTABLE IMAGE ORTHICON CAMERA

In 1946 the first post-war commercial television pickup equipment was delivered to television broadcasters. An important item in this equipment was the portable Image Orthicon camera. The development of the Image Orthicon camera tube was announced late in 1945. This tube provides an increase in sensitivity under unfavorable light conditions of at least 100 times that of pre-war pickup tubes. Cameras employing this tube make it possible to televise indoor and outdoor events under the most unfavorable lighting conditions and thus greatly extend television program possibilities. A special feature of these Image Orthicon cameras is a turret lens arrangement which makes it possible for the camera operator to select in a few seconds any one of four lenses of different focal lengths. The small optical image required by the Image Orthicon together with the small physical dimensions of the tube made possible for the first time the use of such a turret lens arrangement. Focusing of the camera is accomplished by moving the Image Orthicon with its electrical focusing and deflecting coils back and forth along the optical axis while the lens remains stationary.

MICROWAVE EQUIPMENT

Microwave relay equipment was made available to broadcasters during the year. This equipment was developed for transmitting television signals from remote pickup points to the television broadcasting station. Highly directive parabolic reflectors are employed in both the transmitter and receiver and provide a power gain of 5,000 or more, depending on the size of the reflector. The transmitting tube used provides a power output of approximately 100 milliwatts at 7,000 megacycles. This type of equipment is capable of transmitting television signals over line of sight distances of 10 to 20 miles.

TELEVISION RECEIVERS

It is estimated that approximately 10,000 television receivers were produced in 1946. The total number of receivers in use at the end of the year was slightly under 20,000.

A number of technical advances are found in post-war television receivers. Improvements in the input circuits has increased the signal-to-noise ratio in the receiver so that a very acceptable picture can now be obtained with signal strengths of 200 microvolts. The automatic frequency control type of synchronizing system has been incorporated in television receivers to increase their immunity to the effects of noise and interference. In systems of this type the picture synchronization is not affected directly by each received synchronizing pulse but the frequencies of the horizontal and vertical deflection oscillators are controlled through a synchronizing pulse averaging process.

The brighter pictures with greater contrast which are provided by post-war television receivers are the result of improvements which have been incorporated in television picture tubes. The directly viewed tubes employed in 1946 receivers are capable of producing pictures with a highlight brightness of at least 60 ft. lamberts with an area contrast ratio of 75 to 1. This improvement in light output and contrast has been made possible by the development of phosphors of the all sulphide type with higher efficiency and by the technique of applying a very thin coating of aluminum to the back of the fluorescent screen in picture tubes. The aluminum coating acts as a mirror to cause the light, which normally would be lost inside the picture tube, to be reflected through the face of the tube as useful light. Special picture tubes capable of operation at anode potentials up to 30 kilovolts and designed for use with the Schmidt or reflective type of optical system has made it possible to produce television receivers which project 15 by 20 inch pictures having a highlight brightness of 20 ft. lamberts.

COLOR TELEVISION

Development work on color television continued through the year. Sequential color television images were broadcast experimentally by the Columbia Broadcasting System using a transmitter operating on 485 megacycles. The standards which they employed were changed during the year from 120 fields to 144 fields, and the channel width requirements increased to 16 megacycles.

In the fall of 1946 the RCA Laboratories of the Radio Corporation of America demonstrated a simultaneous all electronic system of color television in which images in the three primary colors were transmitted simultaneously and reproduced by superimposing the three images on a viewing screen.

An RMA-RTPB committee was active during the year in studying the various factors which affect standards for a color television system.

At the end of the year, the committee issued an interim report which concluded that much work remained to be done before a satisfactory set of color television standards could be established.

On Dec. 9, 1946 the Federal Communications Commission began hearings on a CBS petition which requested the establishment of a proposed set of standards for commercial color television.

TECHNICAL PROGRESS IN SOUND EQUIPMENT

By W. J. Morlock
RCA Victor Division, Radio Corporation of America

GENERAL

The year 1946 must be viewed as one of the most critical in the history of sound equipment. Because of the large demand for sound equipment, many manufacturers proceeded to put into production their pre-war equipment with only minor modifications. They hoped that, by not taking time to re-tool, production could be speeded up. Also, they believed that ordinary manufacturing problems would be kept at a minimum. Unfortunately, owing largely to shortages of basic materials and components, this plan was not so successful as anticipated.

Sound equipment requires practically the same general type of components used in radio. However, because of the scheduled production of the suppliers to the large manufacturers, it was difficult for many of the sound equipment firms to obtain component parts and delivery of materials. This was especially true of sheet steel. Consequently, 1946 closed with the large commercial demand for sound equipment still unsatisfied.

Definite trends have been established which are noticeable. The demand has been for high quality equipment, even though the price was considerably higher than the market would bear in the pre-war era. Because of the lack of this equipment, owing primarily to OPA ceilings and the manufacturing difficulties encountered, any equipment reaching the market was easily sold. The Government Service experience has demonstrated to many who are returning to private industry the value of sound equipment in their businesses. This will certainly have a pronounced effect on the growth of the commercial demand for sound equipment in the future.

SOUND AMPLIFYING SYSTEMS

The commercial demand for engineered sound systems for factories and offices was not alleviated to any great extent because of the same shortage of materials and lack of qualified personnel to handle this type of installation. With the cessation of the priority system, many manufacturers posponed the procurement of this equipment. The various sound manufacturers have announced especially designed equipment for factories and offices, but it has not appeared on the market in any appreciable quantities. In 1947 many new improved components will appear on the market. The improvements will be basically of more rugged construction, wider range, and better quality. In general, the type of operation is taking on the general characteristics of the equipment used in the radio station broadcasting studios.

The trend is for any new modern industrial plant to be equipped with a suitable sound broadcasting system in order to carry on effective programs of promoting employee morale and cooperation. With labor relations in a critical stage, many manufacturers have found that sound systems have provided them with a means of intimate contact with their employees. The incorporation of special features, such as time signals, fire alarms, and special broadcasts, has given these systems a definite utility value as well as one of morale.

16mm SOUND PICTURE PROJECTORS

Although experience with 16mm sound projectors by the Army and Navy had greatly increased the public desire to use 16mm equipment, many problems have been encountered in producing these equipments during the difficult reconversion period.

In spite of announcements of new designs, practically all of the equipment delivered to the market has been of the basic designs previously used but slightly restyled. There have been announcements by approximately 30 new manufacturers who indicated they will manufacture 16mm sound picture projectors. The trend is to make the equipment lighter in weight and easier to operate.

A few background projection equipments of the cabinet type have found their way into industrial and advertising applications. As with the other type 16mm equipments, this type of application will be more widespread as production difficulties are eliminated.

The improvement in performance has been slight. Non-reflection coating for the projection lenses has come into quite general use. Most of the wire type reels have been replaced by metal stamped units. Some of the carrying cases have been made more convenient and neater in appearance.

Most of the manufacturers are making exceptional claims for the new equipment that they intend to produce. Several of them are reporting that they will have light-weight single-case a-c/d-c equipments which are very convenient for use in the classroom. There have been announcements of high-intensity-arc 16mm equipment for theatre use, but as yet this type of projection has not come into general usage.

The military, realizing the inadequacy of converted equipment, let contracts to several manufacturers during the year for equipments to be specifically developed and designed for military use. As a result of this, development work will be carried on which may be later reflected in improvements in the commercial equipment.

The use of training films has penetrated the educational and industrial field and has created the demand for a large volume of sound projectors. This demand is augmented because of the availability of the government training films to our educational and industrial institutions.

SOUND SYSTEMS IN EDUCATION

The U. S. Department of Education continued to establish specifications for guidance in setting up sound systems for schools and colleges. In many states the basic plans have been completed for frequency-modulation broadcasts from a central broadcasting station to the schools within the area utilizing the new f-m wave lengths which were allocated by the Federal Communication Commission. These plans have been held up because of lack of available equipment. The educational field is extremely interested in seeing the basic plans materialize, and in many cases orders have been placed far in advance of expected delivery.

New consolettes have been announced which provide for ease of operation and a minimum of space. The consolettes are provided with f-m radios.

Various manufacturers have added new items of a sound nature to their line for specific sale to educational institutions. The principal one is a means of wire recording for instructions in voice and public speaking. Various types have been announced, but those employing "slip-in" cartridges are most promising as they eliminate the necessity of the operator handling the very fine wire. This method of recording will doubtless become very popular with the educational institutions owing to the low maintenance cost of magnetic recording, since the medium can be erased and used over again. In addition to the wire recording devices, other disk type recorders which are economical to operate are finding their way into the educational market.

SOUND SYSTEMS FOR HOSPITALS

A great expansion of hospitalization facilities has occasioned a demand for sound equipment, which provides entertainment and relaxation for the patients and assists in the administration of the hospital. The use of pillow type reproducer has increased, and various manufacturers are at present producing units which give a creditable performance. This type of sound distribution provides a method of entertainment which can be individualized to the extent that adjacent patients are not disturbed.

BROADCAST SPEECH INPUT EQUIPMENT

Post-war broadcast problems have prevented the release of a great many newly designed equipment items, and most manufacturers were forced to devote the greater portion of their time to the manufacture and production of pre-war models. There was, however, a scattered release in limited quantities of some high fidelity equipment. Newer designs appearing on the market show an increase in use of plug-in equipments and components. This new equipment shows a very high performance standard, the result of the demand upon manufacturers by the f-m broadcasters. The new equipment has a greater freedom from distortion than the old, and has less inherent extraneous electrical noise. Since it was primarily designed for use with f-m systems, the listeners employing f-m receivers will receive the greatest benefit.

Recording systems have also been improved and new cutter head designs have lowered distortion to a negligible value. Frequency response has been increased to over 10,000 cycles. Temperature compensated cutters for use with acetate recordings have removed the variation in frequency response caused by changes in ambient temperatures. The efficiency of these cutters has been increased considerably which lowered the driving power required for good recording. Magnetic wire and magnetic tape recorders are receiving considerable attention, as the broadcaster has many applications for magnetic recorders in studio and field recording services. The greatest use of the magnetic recorder will undoubtedly be for the recording of programs that are rebroadcast at a later time. This is especially advantageous to the western stations who record eastern programs broadcast at a time convenient to eastern listeners, but not to those in the West. The recorded program can then be released at a time most suitable for listeners in that part of the country. It is apparent that, for the best results, the system must be free from mechanical failures and be able to reproduce the original program without loss of quality. This, the present recording systems are able to do.

SOUND MOTION PICTURES

A new type of color picture film, which was demonstrated by its manufacturer a year ago, is assuming major importance to the motion picture industry, as well as to amateurs. The film base is coated with three differently sensitized emulsion layers. In these layers are incorporated die coupling agents which, when activated by the products of silver development, become dyes of the appropriate colors. The development involves no differential treatment of the three layers, and for this reason the processing is very much simpler than that of previously available three-layer color picture films. The availability of such a film is expected to increase the present strong tendency toward producing a greater proportion of pictures in color. Since none of the dyes effectively absorbs infrared light, to which the present almost universally used cesium tubes are extremely sensitive, sound tracks on color films have, up to the present, been produced in developed silver which is opaque to all kinds of light. In an attempt to avoid a different processing of sound track and picture, manufacturers are interested in a phototube of very high sensitivity to blue light, but no general adoption of such blue-sensitive tubes has yet taken place.

Films having finer grain than those generally used for release prints several years ago, have come into practically universal use for black-and-white pictures with resulting improvement in picture and sound quality. Fine-grain films of adequate speed have also become available for sound recording purposes, and these too have been widely adopted.

For production of 16mm sound tracks, optical reduction printing from 35mm tracks is capable, with satisfactory equipment, of affording the process which gives the best quality in resolution and sound. However, scarcity of optical reduction sound printers, especially printers with the necessary refinement, has retarded the commercial application of this method.

In practically all recording and reproducing equipment mechanical filters are employed to provide constant speed at the sound recording or reproducing point. A recent tendency is toward a simpler damping system in which the film passes over a movable roller connected to a dash pot. This principle has been applied both to recorders and projectors.

A system of recording magnetically on a strip of flexible material coated with a layer of powdered high-retentivity magnetic material in a plastic carrier or binder, has attracted much attention, since it evidently constitutes a high quality sound recording. Although there is no expectation that such magnetic recording will supplant present photographic tracks on release films, it may find an important place in the motion picture industry for initial recording. Duplication must be accomplished by a re-recording operation. Thus far there has been no commercial application of this system in the motion picture industry.

A camera or a television pickup device, known as the *image orthicon* has recently become an extremely important factor in television transmission. Systems have also been developed which make it possible to transfer a televised image to motion picture film. The image orthicon can transmit a practically satisfactory picture where illumination levels are of the order of one per cent of what is required for a motion picture camera using high-speed panchromatic film. Therefore, the combination of an orthicon with the necessary equipment to transfer the televised image to film is of importance in all conditions where the available light is too low for direct photography.

The practice of reducing reflections by coating the surfaces of the lenses has been almost universal for cameras, projectors, and sound optical systems.

NAVAL ARCHITECTURE AND MARINE ENGINEERING

By Erwin E. Martinsky

Technical Division, United States Maritime Commission

GENERAL

The shipping industry both in the operating and construction fields has entered into the period of uncertainty and readjustment incident to returning to peacetime pursuits. The war not only broke the continuity of orderly development of merchant ships into efficient engineering servants of the public, but changed somewhat the conditions which dictate such development and change.

The phenomenal expansion of heavier than air craft in size, speed, and carrying capacity will have an effect on the future of passenger-carrying ocean vessels, which as yet can not be accurately forecast. It has required a re-examination of the factors governing passenger ship design in respect to size, speed, and classes of services, which would find a ready acceptability and attract in sufficient numbers the traveling public.

The policies of the Administration which may be in control in the United States also will have their effect on the development of the U. S. Merchant Marine in direct relation to the tension on the purse strings cutting off or releasing funds for construction and operating subsidies.

The economic aspect of ship operation is most severely affected by the upward swing of wages for ship personnel and longshoremen. The trend from the labor side is to increase the number of crew required and at the same time to increase the wages per man and reduce the hours worked per day. Also the changes in quarters in respect to size and location are tending to reduce the space which might be used to obtain revenue. The cost of handling cargo on and off at dockside is also appreciably higher than pre-war levels. Whether or not these increases can be absorbed by increased efficiency in operation within the subsidy limits which Congress may set is still to be determined. Unless this result can be achieved, it is hard to visualize a privately owned and operated American Merchant Marine of the future.

The foreign maritime countries are also being subjected to increased costs of construction and operation, owing primarily to increased labor costs. However, these nations have all assumed very firm and active policies favoring the most rapid rehabilitation of their respective merchant fleets and full restoration of their foreign trade. A firm policy on the part of the United States will also be required if an adequate post-war American Merchant Marine is to be a reality.

SHIPYARD PRODUCTION

The production records of the American shipyards for 1946 indicate a very rapid slowing down as the year progressed to an estimated rate required for post-war building to keep the merchant fleet at reasonable efficiency. The present urgent necessity to establish early service on essential trade routes with vessels of most modern design has dictated the policy to convert the standard C type vessels from war to peacetime service. This has directly affected the number of contracts let for new construction.

Through October 1946, there were completed in American shipyards 71 vessels over 2,000 gross tons each, totaling 558,000 gross tons. In respect to types, they may be broken down into six passenger-cargo vessels for the Grace Line; one refrigerator vessel for the United Fruit Company; 18, C2 cargo; 16, C3 cargo; seven C4 cargo; three C1 lumber carriers; seven cargo vessels for the Netherlands Government; two cargo vessels for the French Government; two cable ships; five tankers and one coastal tanker. Turbine propulsion was installed on 63 vessels (570,100 H.P.) steam reciprocating on two (8,680 H.P.), and Diesel in six vessels (12,000 H.P.).

There are under contract or under construction in American shipyards as of Oct. 31, 1946, 303 vessels of all types, totaling 506,000 gross tons. These include as major vessels 43 cargo, 12 cargo-refrigerator, 11 passenger-cargo, and five tankers, totaling 70 vessels of 476,000 gross tons. The remaining vessels are of miscellaneous types for restricted services and include 114 non-propelled vessels of 67,000 gross tons. Turbine propulsion is provided for 59 of the major type vessels; two of the passenger-cargo will have turbo-electric drive and nine cargo vessels Diesel powered. The 119 miscellaneous types of propelled craft consist of one steam reciprocating, 113 Diesel, and five Diesel electric installations.

Comprehensive data on foreign shipbuilding are not at hand, but in general terms it would appear that to Oct. 1, 1946, 1,000 vessels of over 1,000 gross tons each are on order or under construction, totaling about 5,500,000 gross tons.

Diesel propulsion predominates three-to-one on vessels building on the Continent. Reports indicate that in Great Britain and Northern Ireland there are somewhat more Diesel powered vessels being built than steam. This is unusual and may be explained in part by the fact that many of the vessels being built are for continental accounts.

CONVERSIONS

An extensive program of reconversion of the C type and other vessels to peacetime service was started during the year. Effort is being made to complete the vessels as nearly to the actual needs of the operators as dictated by the trades in which they are to engage.

The best known of these conversions is that of the *S.S. America,* which served in the war as a troop transport under the name of the *U.S.S. West Point.* In effecting this conversion it was possible to restore the vessel to its former condition as the queen of the U. S. Merchant Marine, except for the readjustment of accommodations to provide for additional crew, thus reducing the passenger-carrying capacity approximately 150. The fresh water evaporating plant installed in this vessel by the Navy has been left in, and has made it unnecessary to carry fresh water except for drinking and standby uses.

The three vessels of the Good Neighbor fleet, *S.S. Argentine, Brazil* and *Uruguay* are in process, or soon will be, of being refitted and reconditioned for post-war use. In making these conversions, simple and modern decorative schemes were employed, making the vessels attractively livable, and at the same time keeping the costs within reasonable bounds. Passenger-carrying vessels being in greatest demand at present, every effort is being made to recondition all such vessels as economic considerations will warrant.

The cargo fleet is also being given full attention by reconverting the C type vessels to merchant service. Many of the conversions are quite extensive and expensive, especially in the case of those vessels built for transport attack and cargo attack use for the Navy. Much structure has to be altered, quarters revamped, cargo handling gear fitted, lighting and power circuits changed, etc., as well as a general overhauling of the entire machinery installations and reconditioning of the hull.

It is expected that by the end of 1946, five C3, eleven C2 and one former passenger-carrying vessels will have been converted. There are under way or planned 106 additional conversions which are expected to be completed in 1947. Many conversions are being made by private operators of their passenger-carrying vessels.

RESERVE FLEET

At the end of October 1946, a total of 1,733 vessels were in the various reserve fleet anchorages, consisting of 34 different designs. The lay-up process is designed to be as simple and economical as possible, compatible with proper preservation of the ships' hulls, machinery, and appurtenances. Steel surfaces inside and out will be sprayed with oil which has special rust-removing qualities. Later a second coat containing paint will be given, which will form a pliable skin with soft oil next to the steel. It is estimated that this treatment will be effective for about three years. Machinery and boilers, etc. will be flushed through with preservation oil on the steam side. Pumps and piping on water side will be greased. Sea cocks and overboard discharges will be drained and greased, packed to prevent freeze damage and to protect against corrosion. Engines will be opened, drained, greased, and the packing removed. Cargo rigs will be stowed below decks, and all movable equipment stripped from the ship and warehoused, or if in short supply, will be allocated to ships in operation. Electrical equipment will be protected against water entering from outside sources. Wiring in exposed locations will receive a coat of moisture-repellent varnish. The experience gained in the effectiveness of preservation methods used on the laid-up fleets after the First World

War is being used to the fullest extent.

PROPELLING MACHINERY

The principal characteristics of the main propulsion drives on large vessels showed no major changes during the year. The vessels built by American yards were in respect to machinery substantially duplicating types built previously. Several Diesel installations on small cargo vessels conformed to conventional methods.

An experimental installation of a 6,000 S.H.P. Nordberg trunked piston Diesel engine was made in the Victory type ship, *M.S. Emory Victory*. The ship is equipped with a nine-cylinder 29″ x 40″ main engine rated at 6,000 S.H.P. at 160 R.P.M. and two five cylinder Nordberg auxiliary engines 18″ x 25″, each of which drives a generator of 800 K.W. capacity. The Scavenger air for the main engines is supplied by motor centrifugal blowers, which accounts for the relatively high generator capacity required. From public reports, the logs of three voyages indicate that, in a total of approximately 21,000 miles traveled, the main engines operated 1,500 hours, with an average consumption of lubricating oil of 24 gallons per day and an average observed miles per barrel of fuel oil of 2.26 (Main and Auxiliary Engines). While these results may be considered to indicate good all-around performance, a longer service period should elapse before any final judgment may be given as to the merits of the installation.

Owing to delays caused by strikes and other causes, the experimental gas turbine installation in a Liberty type collier has not been completed. Nothing has developed in regard to the gas turbine field during the year which would cause any change in the optimistic predictions of performance for the 3,000 S.H.P. unit involved.

The Navy Department is also carrying on an experimental gas turbine test at the U. S. Navy Experimental Station, Annapolis. Data are being taken at progressively increased temperatures to determine efficiency of operation and the behavior of metals at high speeds and temperatures. Much valuable information has been gathered, and when correlated and studied should reveal the most efficient methods of designing and constructing units for marine and other uses.

The Navy has concluded an interesting experimental installation and series of tests of the Kirsten Cycloidal propeller on a 900-ton LSM type vessel. Complete results of the tests are not available but it is understood that they have been quite successful in respect to maneuverability, absence of vibration, and satisfactory operating efficiency. The installation consisted of twin rotors equipped with six vertical blades, each of which revolves on its own axis as the rotor revolves. The orbit diameter of the propeller is seven feet, and the rotor is driven through a specially designed spiral bevel gear unit. The pinion shaft is directly connected to the engine shaft by a flexible coupling.

Steering is accomplished by a control gear which directs the propeller thrust outward from the propeller shaft without altering the direction of rotation of the rotor. Reversing is accomplished by turning the control 180°, thus eliminating the necessity of a reversing gear and the need for rudders. Full sidewise motion was obtained without forward motion; also, a complete circle was turned with the bow as the pivot and without any forward motion. It will be interesting to follow the future development of this form of drive.

ALUMINUM ALLOY STRUCTURE

Aluminum alloy as a material of construction for superstructure on passenger vessels has been incorporated into several designs during the year. The Mississippi Shipping Company has three passenger-cargo ships building on which will be included a so-called aluminum stack house, housing a false stack, and two decks for officers' quarters, radio room, etc. Aluminum lifeboat and gear are also fitted, with the net result that the vessel's stability characteristics will be benefited by the reduction in topside weights. The vessel design is based on the standard C3 lines and propulsion.

The Alcoa passenger-cargo ships building at Kaiser yards have the two upper decks, lifeboats, and gear made of aluminum alloy. These vessels are based on the Victory type hull and machinery. As in the case of the vessels building for the Mississippi Shipping Company, the main benefit of the installation is in respect to stability characteristics and some saving in weight.

The projected design, P3-S2-DA1, under preparation by the Maritime Commission, has extensive superstructures of which the two uppermost tiers are of aluminum alloy. The saving in topside weight is so considerable that it is possible to obtain satisfactory stability to meet the Commission's high standards with a beam of from 4 or 5 feet less than if steel had been used. In turn this reduction in the vessel's beam has resulted in a saving of hull steel so that, from the standpoint of cost, the added expense of the aluminum will be largely if not all written off.

This direct effect of saving in topside weights by use of aluminum has far-reaching effects on the basic design of hulls having extensive superstructures. The hull lines are affected by the change in beam resulting in a form which requires less power to drive at the higher speeds. The introduction of adequate liquid ballast over the operating range of drafts usually required to obtain suitable stability should be easy of attainment, making for simpler operation.

CARGO HANDLING AND PRESERVATION

The program for the development of overhead gantry type cranes for cargo-handling on board ship is still in the experimental stage. Owing to the difficulty of obtaining certain materials which have been in short supply, the tests of the final rig developed from earlier experimentation have not been completed. The installation of this type of gear as the cargo-handling gear for ships in service will have to wait on the completion of tests and the final assessment of the advantages and disadvantages of the system.

There is in process of design a six-hold cargo vessel specially arranged for the expeditious handling of cargo. The conventional burtoning system will be used in conjunction with twin hatches fitted in all but the extreme forward and aft holds. This arrangement makes it possible to land the cargo from the hook at the place it is to be stowed. The slow and difficult task of filling the wing sections which the single hatch type of ship necessitates will thus be eliminated in a large measure, and the handling of cargo expedited.

The use of dehumidifying equipment for the protection of cargo against sweating and moisture damage is becoming more and more the accepted practice. This is especially so in the trade routes which encounter wide variations in temperature and humidity conditions and consequently would be subjected to the greatest hazard in respect to sweating.

CONSTRUCTION TRENDS

The United States ship construction program for 1947 has been subject to change from time to time because of changes in budgetary policies of the Government, and can not at this time be considered as final. This is especially true in respect to the construction of large passenger liners, which are needed for the proper restoration and maintenance of service in the essential trade routes.

The conversion of ships from war to merchant uses is proceeding rapidly and should be practically completed in 1947. The conversions in respect to passenger-carrying vessels are along functional rather than luxurious lines. Joiner work that has to be replaced in general will be of incombustible materials to meet new ship specifications.

The passenger-cargo ships constructed in 1946 and under contract for 1947 are fitted with relatively low numbers of berths. The vessels building for the Grace Line are fitted for 52 passengers; those for the Mississippi Shipping Company, 120 passengers; for Alcoa, 98 passengers. There is only one-class service on these vessels, which is first class. The cabins are roomy, and the public rooms though modern in styling are luxurious. Air conditioning is used extensively in both passenger and crew accommodations and public spaces, the trade route on which the vessel is to be used determining what spaces need such treatment.

The projected designs for the large passenger liners and those vessels now in operation call for three classes of accommodations, *viz.*, first, cabin, and tourist. It is believed that the new vessels will tend toward supplying the traveler with greater conveniences coupled with modest interior treatments affording accommodations and service equal to good hotels ashore.

The trend in speed is ever upward for all types of vessels. This is dictated in part in passenger vessels by the competition of air travel. It is dictated in all types of vessels by military lessons learned during the war. With modern submarines capable of 25 knots on the surface it is imperative that the speed of merchant ships be stepped up, especially those types which are potential naval auxiliaries. Finer hull lines will result in order to keep power requirements at a minimum.

The external appearance of passenger ships is tending toward stream lines with low stacks and superstructure effects. The low stack is undesirable from a utility standpoint as smoke, soot and gases may find their way on to decks and into open windows, under certain wind conditions. One solution of this problem, incorporated in the Mississippi Shipping Company new passenger-cargo vessels, was the use of kingposts for the escape of smoke, etc. The usual centerline smoke stack is a dummy stack, abbreviated in height, blending in with the sleek appearance of the superstructure.

Steam conditions are in general going to higher pressures and temperatures, the materials of construction determining the upper limits for both. The gains in efficiency obtained by use of high temperatures and pressures have resulted in lowering the number of boilers required and reducing the space requirements for machinery.

United States laws and regulations require fireproof construction using incombustible bulkheading, ceilings, and paneling. There is no comparable requirement of foreign nations. It would appear that there is a definite trend in foreign ships to use combustible materials in lieu of wood paneling for some applications.

Many installations of radar and Loran have been made on American ships. Both of these electronic devices are developments of the war. Radar is useful in detecting the proximity of other vessels, or any solid object under conditions of poor visibility. Loran, an abbreviation for Long Range Navigation in conjunction with shore stations, enables a vessel accurately to obtain a fix under any weather or visibility conditions. A sharp reduction in collisions and stranding should be the result of the use of these equipments, making for still safer navigation by sea.

GEOPHYSICAL SCIENCES

EARTHQUAKES AND VOLCANOES

By Frank Neumann
U. S. Coast and Geodetic Survey

GENERAL

Although nearly 3,000 persons were reported killed by earthquakes in 1946, this number was far below the average of 14,000 estimated from historical records. The greatest seismic seawave to strike the Hawaiian Islands since 1868, and the offshore Dominican Republic earthquake which was one of the five greatest recorded on instruments since 1900, were the two outstanding events.

Volcanic activity was moderate but widespread with only a few cases of serious destruction. Research in seismology and vulcanology gradually tended toward a peacetime pattern although international cooperation was still seriously impaired. Seismological principles and methods found continued application in national defense problems.

EARTHQUAKES IN FOREIGN AREAS

Disastrous earthquakes occurred in eastern Turkey, Algeria, Dominican Republic, Russia, Japan, and Peru. On Feb. 14, 276 persons were killed near Constantine in the mountains of northeastern Algeria. An earthquake in eastern Turkey on May 31 killed 1,300 persons in the community of Karliova. Many villages were practically destroyed because of the collapse of clay and mud walls which supported heavy tile roofs. On Aug. 4, one of the most violent earthquakes of the last decade struck a short distance off the northeastern coast of Santo Domingo. Nearly 100 persons died in a seismic seawave which swept the Scotch Bay area; several churches in the interior were destroyed, and many smaller buildings collapsed. On Nov. 3, Uzbek Province and the Dzhalah Abad region east of Samarkand, suffered widespread casualties and destruction. Relief was rushed by the central government. A violent earthquake in northern Peru on Nov. 10 killed 800 persons. Thirty per cent of the structures in the central area were damaged. On December 21 a violent seaquake and seismic sea wave off the Island of Shikoku, Japan, killed 1,500 persons and destroyed nearly 2,000 homes.

The less important earthquakes of the year included one in Switzerland on January 25 when communication lines were disrupted and hundreds of churches and homes were damaged in the Canton of Valais; a presumably submarine earthquake near New Britain on May 5 which damaged roads in the Rabaul area; a violent shock at Port-de-France, Martinique on May 21 which damaged numerous church steeples; and a series of earthquakes in Iraq on Aug. 22 which leveled the village of Penjwin.

EARTHQUAKES IN THE UNITED STATES AND POSSESSIONS

The strongest shocks of the year occurred in the Puget Sound area and southern California. On Feb. 15, an earthquake centering west of Tacoma, Wash. caused some structural damage in the Seattle, Tacoma, and Olympia areas, the total damage being estimated at $250,000. On June 23, the same area was again shaken by an earthquake originating in Georgia Strait, British Columbia, which caused much damage along the northeastern shore of Vancouver Island. The bottom of Deep Bay dropped a maximum of 84 feet, roads were badly broken, and scores of chimneys fell. Bridges near Vancouver and Seattle were damaged.

A strong shock on March 15 in southern California caused rolling boulders to damage the Los Angeles aqueduct severely.

In outlying territories, one of the most important earthquakes of the year occurred on April 1 when a seaquake originating in the Aleutian Trench, Alaska, sent the greatest seismic seawave in many decades across most of the Pacific Ocean. The lighthouse at Scotch Cap near the epicenter was washed away, killing five men. In the Hawaiian Islands a 20-foot wave struck Hilo where most of the $20,000,000 damage in the Islands occurred; 173 persons were killed and 291 injured.

SEISMOLOGICAL STATIONS AND INSTRUMENTS

Modern seismographs were installed at Loyola University, New Orleans, and at Regis College, Denver; and a Keller type of visible electronic recorder was installed in the Commerce Building, Washington, D. C. Development of two new types of electronic seismographs was well advanced. In the United States 45 seismographs for locating earthquakes, and 50 special seismographs for measuring destructive ground motions were maintained in operation.

A history of the Manila seismological station which was destroyed during the Japanese invasion was published. In South America, new stations were being established at Punta Arenas and Panimavida, Chile, and at Manizalles, Colombia; and in Europe many stations resumed operation. Close cooperation is maintained between seismological stations the world over.

SEISMOLOGICAL INVESTIGATIONS

St. Louis University seismologists found that earthquakes in the central Mississippi valley and Ozark areas were related to the Ozark uplift and to known fault systems. At the California Institute of Technology, the investigation of earthquake magnitudes as measured from instrumental records was extended to include deep focus shocks. The number of large earthquakes was found to fall off rapidly with increasing depth. The Dominion Observatory at Ottawa, Canada published a descriptive report on the earthquake hazard in eastern Canada and made a field investigation of the destructive British Columbia earthquake of June 23.

Harvard University reported that an apparent discrepancy between seismic wave speeds resulting from earthquakes and from blasting operations could be explained by personal factors of interpretation. This is important in locating earthquakes from instrumental data.

The U. S. Navy expanded its microseismic-meteorological project as a result of the success obtained in detecting and tracking hurricanes during two seasons. It was found that microseisms due to hurricanes, cold fronts, thunder storms, high wind, and fair weather, have certain individual characteristics. The U. S. Coast and Geodetic Survey found correlations between microseisms and low-pressure areas in extra-tropical regions. In a broadcast on Jan. 13, 1946 Rev. Dr. James B. Macelwane, S. J., president of the Jesuit Seismological Association, again emphasized the futility of attempting to predict destructive earthquakes.

In vulcanology an exhaustive report was released on temperature and other studies made at Paricutin volcano by the Geophysical Laboratory of the Carnegie Institution of Washington. A basaltic lava was indicated.

VIBRATION RESEARCH

Seismological instruments and principles were increasingly employed in engineering and other research involving vibration measurements. Seismographs designed by the University of California were installed on the Golden Gate Bridge to study its vibration characteristics, and seismologists made vibration measurements on foundations for important Federal engineering projects.

The ground waves generated by atomic bomb experiments were recorded on sensitive seismographs at distant stations. Vibrations set up by controlled explosions of large quantities of unserviceable ammunition were measured on portable seismographs to obtain more data on deep geological structure and to gain further information on seismic wave propagation. The University of California completed a report on the ground and air waves resulting from the Port Chicago, Calif. ammunition blast of June 17, 1944 which was heard 250 miles away.

RELATED MEASUREMENTS

A chart was prepared by the U. S. Coast and Geodetic Survey showing the successive half-hour positions of the seismic seawave which spread across the Pacific Ocean from the Aleutian Islands earthquake on April 1, 1946. A tide gage in Puerto Rico recorded both ground and water waves resulting from the violent Dominican Republic earthquakes of Aug. 4 and 8. Important new evidence on the extent of ground displacements near earthquake faults was found in an analysis of a precise re-survey made immediately after the destructive earthquake near El Centro, Calif. in 1940.

SEISMOLOGICAL ORGANIZATIONS AND PUBLICATIONS

There were no significant changes in organizations and publications as compared with 1945 except that an anticipated increase in the volume of papers on peacetime subjects materialized. The epicenters of nearly 50 important earthquakes in all parts of the world were made immediately available to scientists and the public through a cooperative program between Science Service, the Jesuit Seismological Association, and the U. S. Coast and Geodetic Survey. After the destructive seismic seawave of April 1 a number of government agencies planned to establish an effective warning program.

The program of the State Department and the U. S. Coast and Geodetic Survey to effect more active cooperation in seismology in the Western Hemisphere was instrumented by again sending a seismologist to visit most of the seismically active countries. Seismologists of the U. S. Coast and Geodetic Survey and Fordham University visited the Dominican Republic, on invitation, to participate in the investigation of the destructive earthquake of Aug. 4. The University of Santo Domingo was advancing plans to establish a first-class seismological station when the earthquake occurred.

In Washington, D. C., the National Research Council sponsored a Pacific Science Conference to formulate plans for expanding scientific research, including seismological investigations, in the Pacific area.

VOLCANOES

Volcanic activity continued in many parts of the world although no eruptions of outstanding importance occurred. The most destructive eruption began about March 20 when Mount Sakura-Jima, across the Bay from Kagoshima in southern Japan, blew great boulders more than 1,000 feet into the air and sent up a smoke column 3,000 feet high. Lava flows 20 to 30 meters deep doomed nearby villages. In San Salvador, Izalco erupted on May 11 after 12 years of quiescence. In June, the crater of Santiago volcano in Nicaragua was again emitting fumes which menaced nearby coffee crops.

In the Tonga Islands, a volcano on Niuafoou was in violent eruption on Feb. 17, 1946, and a lava flow partly covered a village. On Sept. 25, Messina, Italy, reported Stromboli again active. On Kamchatka Peninsula, Kluchenskayo, active since December 1944, became increasingly active late in October. In February, a volcano in Baluchistan, north of Karachi, India, was reported emitting mud instead of steam and ash; and in the Pacific Ocean 200 miles south of Yokosuka Naval Base, a volcanic island rose from the sea in February emitting steam and sulphur visible for miles.

In New Zealand, Mount Ruapehu, which became active in August 1945, continued to shower volcanic dust over a wide radius. Paricutin volcano in Mexico was intermittently active early in 1946 but there was an overall subsidence during the year.

Volcanic ash reported by ships over the Aleutian Trench in May 1945 was later discovered to be due to a spectacular eruption on Umnak Island which blew steam and ash several thousand feet into the air.

MINERALOGY AND PETROGRAPHY

By Clifford Frondel

Department of Mineralogy, Harvard University

SYMPOSIUM ON THE SYNTHESIS OF SINGLE-CRYSTALS

Although most solid materials are crystalline, they are ordinarily composed of multitudes of minute, randomly oriented crystal grains, much as lump sugar, and the properties of the aggregate differ in certain significant respects from those of the individual grains. For certain industrial and scientific applications, however, it is essential to employ single crystals. The principal demand has come from the electronics industry, where piezoelectric single-crystals are used as frequency controlling elements in radio, in telephony, phonograph pick-ups and a variety of other devices. Additional uses include lenses and prisms for optical instruments, electro-optical devices, wire-drawing dies, cutting tools, and bearings for watches and other instruments. Single-crystals of substances transparent to infra-red radiation also were employed during the war in detection devices and have varied peacetime applications.

The procurement of crystals for these applications presents numerous difficulties. Many of the substances do not occur in nature, or if they do, are not found in pieces of sufficient size or quality. The difficulties encountered in obtaining an adequate supply of natural quartz crystals for radio applications have been mentioned in preceding issues of The American Year Book. During 1946, both the Army and Navy entered into extensive research programs directed toward both the development of methods for growing crystals artificially and the discovery of new crystalline substances of superior properties. This work is being carried on both in government laboratories and under development contracts awarded to research laboratories in industry and universities. Particular emphasis has been placed on the development of methods for growing quartz by artificial means and on a search for substitutes for quartz for piezoelectric applications. It is interesting to note that, late in the war, the Germans developed a near-practical procedure for the synthesis of quartz.

A symposium of 14 papers summarizing recent work in the general field of synthetic single-crystals was held by the American Association for the Advancement of Science during the annual meeting of the society. Among the contributors were representatives of the Naval Research Laboratories, Bell Telephone Laboratories, Brush Development Co., Harshaw Chemical Co., and various private and university laboratories holding development contracts with the U. S. Signal Corps. The methods of synthesizing quartz and possible substitutes for quartz, such as nepheline and aluminum metaphosphate, were described in detail. The preparation of crystals of these substances presents many difficulties, since they must be made at high temperatures either from fusion or from hydrothermal systems in closed steel pressure bombs. Much more attention is at present being given to various water-soluble salts, which can be synthesized as single-crystals under ordinary laboratory conditions. Among such substances may be mentioned ADP (ammonium dihydrogen phosphate), which was made in mass production during the war. The water-soluble salts in general are mechanically weak and, though they may have a relatively high piezoelectric response, are inferior to natural crystals in this respect. Another wartime development in the field of crystal synthesis was the construction and operation of a plant for the manufacture of synthetic corundum (sapphire) crystals for use as bearings. This broke the dependency of the United States on the long established Swiss and French sources of supply.

INDUSTRIAL DIAMONDS

During the war years the consumption of industrial diamonds in the United States rose to a new peak, owing largely to the demands of the munitions industry for abrading and cutting tools and wire-drawing dies. During 1945, approximately 9,000,000 carats of industrial diamond (bort) were used in the manufacture of diamond impregnated grinding wheels and saws alone. Tools of this type were in special demand for sawing and grinding quartz in the manufacture of oscillator-plates for radio control (The American Year Book, p. 804, 1945). The consumption of industrial grades of diamond during recent years has remained considerably greater than the production. The total production in 1944 amounted to 11,500,000 carats, of which about 4/5 was of industrial grade and the remainder of gem quality.

The increased utilization of diamond and the scarcity of suitable material has greatly stimulated research and development work directed toward improving the design and efficiency of diamond tools. A symposium of papers detailing the advances in the technology of diamond tools was recently published (*Amer. Mineralogist,* vol. 31, p. 135, 1946). Most of the research has been essentially of a crystallographic nature. This is occasioned by the fact that many of the applications of diamond in industry require the use of single-crystals rather than of aggregates. Since the properties of diamond, such as the hardness, vary with direction in the crystal, the proper and most economical use of the stone requires a knowledge of its structural properties and symmetry. Thus, the efficiency of a diamond single-crystal used as a cutting edge may vary over 100-fold according to the orientation of the stone relative to the surface being cut. Detailed investigations of this problem were carried on in several university and industrial laboratories and contributed greatly to an understanding of the proper design of diamond tools. Important researches also were contributed by the National Bureau of Standards and others on the problem of drilling holes in diamond crystals for use as wire-drawing dies. The high voltage arc and electrolytic methods of drilling as at present developed have reduced both production time and cost. Holes equal or superior to those drilled mechanically have been obtained by these methods down to diameters of less than 0.0005 inch. The earlier method comprised drilling with a thin drill stem using diamond powder as abrasive and did not easily afford dies of desired contour and diameter. The high voltage arc method also has applications to the facetting and sawing of diamond crystals for use as gem stones.

CLAY MINERALS

A monographic study has been made of the montmorillonite group of clay minerals, one of the most widely occurring of all mineral materials (*U. S. Geol. Survey Prof. Paper 205B,* 1945). Clays are the end products of weathering of a wide variety of rocks and play a fundamental part in the physical and chemical properties of soils and soil fertility. They also constitute the most abundant raw material of the ceramics industry, and as the principal constituent of shales and other poorly consolidated rocks they are an important factor in a wide variety of engineering problems. Our present knowledge of the clay minerals is largely a consequence of the advent of new and powerful research tools suited to the examination of extremely fine-grained mixtures. The electron microscope, x-ray diffraction techniques, the differential thermal analyzer, and the petrographic microscope all have been brought to attack on the problem. The utility of these methods rests in the fact that they are able to resolve the properties of the individual constituents of the clay rocks and supplement the older chemical and physical methods of investigation which yielded information largely restricted to characteristics of the clay rock as a whole.

The crystal structure of montmorillonite is found to be of the so-called layer type, of which muscovite mica and kaolinite are examples. The silicon and aluminum atoms have tetrahedral coordination in respect to oxygen. Iron, alkaline earths, alkalies, chromium, and some other atoms have octahedral coordination, the crystal structure as a whole consisting of indefinitely extending silicate sheets or layers. The bonding forces between adjacent sheets are relatively weak. Exchangeable cations, usually sodium and calcium, are on the surfaces of the silicate layers and give rise to the base exchange phenomena for which these minerals are noted. This property is found to play a prominent part in determining the physical properties of minerals of the montmorillonite group, in particular their behavior toward water. The composition and mineral relations of the clay minerals are intimately related to the conditions under which they form. In general, alkalic feldspars and the micas tend to alter to the kaolin type of clay minerals, whereas minerals rich in iron and magnesium, the calcium-rich feldspars, and volcanic glasses commonly alter to members of the montmorillonite group. The montmorillonite minerals usually form as weathering products but may be formed at temperatures up to about 200°C in association with ore deposits.

DESCRIPTIVE MINERALOGY: NEW MINERALS

A restudy of the zinc-bearing clays by the U. S. Geological Survey has shown that they are not mixtures of kaolin and hemimorphite, as long considered, but are composed of a distinct mineral, for which the name *sauconite* is proposed. Sauconite is the zinc analogue of saponite, the magnesium member of the montmorillonite group. *Artinite,* a basic carbonate of magnesium, has been found at Luning, Nev., as a minor constituent of the brucite deposit there worked as a source of magnesium. Minor occurrences of this rare mineral also have been found recently in Vermont and Greenland. *Tinticite* is a new iron phosphate found in the Tintic mining district, Utah. Other new mineral species found recently include *zirfesite,* a zirconium silicate allied to allophane from the Kola Peninsula, USSR, and *franquenite,* an iron sulfate closely related to *slavikite.* A new hydrated oxide of manganese from Russia has been named *vernadite* after the distinguished Russian geochemist V. I. Vernadsky. *Christiansenite* is a new chemical variety of tridymite containing a considerable amount of sodium and aluminum in solid solution and representing an intermediate member of an isomorphous series towards nepheline.

The soda-rich member of the pyroxene group, *acmite,* has been found in quantity in the Cuyuna iron district, Minnesota. The mineral occurs disseminated in the matrix of the iron formation (taconite) and in local high temperature hydrothermal veins that cut the ore body. Study by optical and x-ray methods proves that *fuchsite* is a chromium-bearing variety of muscovite, in which a small amount of chromium substitutes for Al in the crystal structure. Another chromium-rich mica, *mariposite,* is probably to be classed as a variety of *phengite.*

TERRESTRIAL MAGNETISM AND ELECTRICITY

By H. D. Harradon
Department of Terrestrial Magnetism,
Carnegie Institution of Washington

GENERAL

In the course of the war, nearly all the scientific investigators and organizations had been called from peacetime research to participate in activities connected with the conduct of the war. In the United States the Government received great assistance from geophysicists who were able to take over the study of many problems the solution of which involved not only the application of the results of old methods of attacking theoretical and practical studies but also the initiation of new lines of research. The experience gained during this long interruption of normal programs of work has suggested the desirability of abandoning certain activities previously pursued in favor of new ones developed during the war. As a partial compensation, activities classified during the war have now been released for general study and information.

One of the obstacles to the progress of theoretical studies in geomagnetism has been the almost complete interruption of ocean magnetic observations and the great reduction in land-survey work. This unfortunate condition has been somewhat alleviated by the limited occupation of repeat stations, particularly by observers of the U. S. Coast and Geodetic Survey in Latin American countries, a large portion of the results of which were published during 1946.

GEOMAGNETIC RESEARCH

At the Department of Terrestrial Magnetism, Carnegie Institution of Washington, isoporic charts based on secular-change results obtained at about 2,000 stations have been compiled for epochs 1912.5, 1922.5, 1932.5, and 1942.5 for seven geomagnetic elements at ground level and for three of the elements throughout the atmosphere to an elevation of 5,000 km. Charts for the potential and vertical gradients for secular change at ground level were also prepared. Main-field isomagnetic world charts for declination, horizontal intensity, and vertical intensity based on results secured at about 10,000 stations since 1905, in 17 sections each, were completed for the epoch 1945.0. Charts in three sections for the northward, eastward, and total components of intensity and for inclination have also been constructed. In addition, a 17-section index-chart showing the positions of all declination-stations used in the construction of these charts was prepared.

Spherical harmonic analyses of the secular change charts at four epochs were completed. It is inferred that secular change is likely to originate chiefly in the mantle of the Earth below the crust in a region of high electrical conductivity. Spherical harmonic analyses have also been made of the main-field charts and of various geomagnetic variations.

Attention has been given to the problem of magnetic surveys from the air from which it is hoped that sufficient accuracy may be obtained to contribute to the scientific investigation of such problems in geomagnetism as the separation of the internal and external fields of the Earth and the solution of the question as to the existence of the so-called non-potential portion of the field. While aerial observations can not at present be expected to possess the precision of ground observations, the greater area that can be rapidly surveyed from the air will render the data more significant for analytical purposes than the present data obtained at the surface. Aerial observations may be made over regions inaccessible to the ground observer, particularly over the oceans and in polar regions. A better idea may be obtained of the magnetic field over regions where otherwise only a few land observations, which may not adequately represent the field, can be secured.

Isomagnetic charts based on surface observations must always be limited in the faithfulness of their depiction of the field, because of the impracticability of obtaining observations at an infinite number of stations and of deductions for both the regular and irregular changes of the field.

Investigations have been conducted to improve the reliability of predicting magnetic storms on the basis of their recurrence-tendencies employing the principle of multiple correlation, a method which was recently generalized by Wiener. Sufficient improvement in the results justify the application of the method.

The determination of the secular variation in past ages by the examination of sediments, interrupted by the war, is now being resumed. An expedition to Bradford and South Newbury, collected a new series of varves representing sedimentation during approximately 1,500 years. It is the intention to carry this important investigation to a definite conclusion in the expectation of tracing the change in intensity and direction of the magnetic field through many thousands of years.

In the course of a study of the relations of magnetic storms and microseismic activity at the Huancayo Magnetic Observatory over a two-year period, it was found that the maximum daily amplitudes of microseisms seem to show correlation with magnetic character-figures, depending on the time-lag introduced.

GEOELECTRICITY

Under the auspices of the American National Research Committee for the study of the Parícutin Volcano in Mexico, a reconnaissance was made in the latter part of 1945, to determine whether a program of electrical studies should be undertaken there and particularly whether it would be possible to advance our knowledge of the mechanism by which electricity during thunderstorms is generated, by a study of the unique conditions existing at the volcano. From observations made with an electrometer in the vicinity of the volcano-cloud, it was found that sudden field changes, similar to those accompanying a lightning discharge, occurred frequently during intense eruptions. These field-changes were much smaller than those associated with lightning.

The apparently increasing pollution of the atmosphere has been the object of further study. Tests and discussion of accumulated data on the pollution of the Earth's lower atmosphere, have shown that the pollution is gradually increasing, not only over the ocean near industrial land areas and the principal trade routes, but also over the regions of the ocean remote from such activities. It was ascertained that the amount over the oceans apparently doubled between 1914 and 1929. The gradual increase of industrial and commercial activities of nations is bound to play an important part in atmospheric pollution and gives rise to speculation as to the consequent changes in the composition of the atmosphere and their ultimate effect on life on the Earth.

Analysis of results obtained at Washington, D. C. shows a substantial diminution in the rate of ionization when the soil is wet as compared with that when it is dry. The same holds true when the ground is covered with snow and when it is uncovered. There is also revealed a definite seasonal and diurnal variation in the atmospheric ionization.

Electronic equipment for measuring rapid changes in the conductivity of the atmosphere for airplane use is included among the new instrumental developments.

By direction of Congress, the Weather Bureau, with the cooperation of the Army, Navy, and National Advisory Committee for Aeronautics, established the Thunderstorm Research Project to study the microstructure and dynamic processes of thunderstorms. The first phase of the project was conducted near Orlando, Fla. in the spring and summer of 1946, during which period 91 storms were selected for analysis and detailed study. Electrostatic field measurements could not be made because of non-availability of necessary instruments, but during the latter part of the period Army P-61 plane crews made visual observations of lightning flashes and strikes on the planes.

The second phase of the project began Oct. 1, 1946, and the field operation of this phase will be initiated about April 1, 1947, near Clinton County Army Air Field, Wilmington, O. This operation will closely approximate the methods used during 1946, except for the utilization of some new and improved techniques resulting from experience gained the first season and the use of 14 electrostatic field recorders that have been loaned to the project by the Navy.

While the thunderstorms of the 1946 season were of the convective type, the move into a middle latitude area is for the purpose of investigating the characteristics of other types of thunderstorms, particularly those related to or connected with the movement of fronts.

OBSERVATORIES AND SURVEYS

The five magnetic observatories of the U. S. Coast and Geodetic Survey (Cheltenham, Tucson, Honolulu, Puerto Rico, and Sitka) continued in operation. In Hawaii, a new magnetic and seismological observatory has been completed to replace the former Honolulu Observatory which had to be abandoned because of disturbing effects on the instruments emanating from the nearby airfield. The new site is about four miles from the former one.

The regular geophysical programs were continued throughout the year at the observatories of Pilar, La Quiaca, South Orkneys, and San Miguel in Argentina, at the Vassouras Observatory in Brazil, and at the Magnetic Section of the National Astronomical Observatory of Mexico, at Teoloyucan. The Huancayo Magnetic Observatory, operated by the Carnegie Institution of Washington, continued to pursue its program of operations in geomagnetism, geoelectricity, and allied fields. Because of its unique position near the geomagnetic equator and its activities in so many branches of geophysics, this is the most important geophysical observatory in the Western Hemisphere.

Excellent progress has been made in the magnetic survey of Uruguay undertaken by the Servicio Geográfico Militar. This survey called for a network of 77 stations spaced at intervals of approximately 50 to 60 kilometers, 62 of which had been occupied by Nov. 12, 1946, and it was expected that the field-work would be completed by the end of the year.

The experimental continuously recording declination-station set up at Gatlinburg, Tenn. by the U. S. Coast and Geodetic Survey, to obtain data on the diurnal variation and secular change, was operated from October 1945 to February 1946, at which time it was serviced and allowed to operate until April 1946. The experimental records were so promising that the equipment was returned to Washington and served as a model for the construction of similar instruments for installation elsewhere. It is proposed to build, as soon as conditions permit, a network of about 20 stations in the United States. These stations are to operate for periods of three to six months without servicing and are expected eventually to record continuously the declination, horizontal intensity, and vertical intensity.

CANADA, GREENLAND, ALASKA

The Canadian observatories of Meanook and Agincourt, under the Dominion Observatory, continued in operation throughout 1946. At the Godhavn Observatory in Greenland, complete magnetic records were obtained. The temporary station at Ivigtut was discontinued July 16, 1945.

The Observatory at College, Alaska, was operated through the collaboration of the University of Alaska and the Carnegie Institution of Washington until June 30, 1946. After that date the magnetic program was continued by the U. S. Coast and Geodetic Survey, and the responsibility for ionospheric work was transferred to the newly formed Central Radio Propagation Laboratory at the National Bureau of Standards, Washington. A survey of a tract of land, leased by the University of Alaska, is being made and preparations are in progress for the erection of a permanent first-order magnetic observatory by the U. S. Coast and Geodetic Survey. A bill to authorize an appropriation for the establishment of a Geophysical Institute at the University of Alaska was passed by Congress and signed in July 1946 by President Truman.

POLAR REGIONS

Magnetic observations were made at eight stations in the region of the North Magnetic Pole by an observer of the U. S. Coast and Geodetic Survey in connection with the Nanook Expedition of the U. S. Navy. One station was at Thule, Greenland, and the others were on Devon Island and neighboring islands of Canada. Results obtained on the *Pacusan Dreamboat,* during its non-stop flight from Hawaii over the Arctic regions to Egypt, have been interpreted to indicate that the present position of the North Magnetic Pole has shifted somewhat from the position determined by Amundsen's expedition in 1904, but the amount of this shift is as yet undetermined. Observations made on the R. C. M. P. schooner *St. Roch* on her voyage in these regions in 1944 seem to indicate that the Pole is still on Boothia Peninsula. Further expeditions are being planned for the purpose of establishing the actual position of the North Magnetic Pole.

Among the objects of the Expedition of the U. S. Navy to Antarctica which left Dec. 2, 1946, is a long series of magnetic observations at Byrd's base in Little America, and as many observations at field stations as may be obtained. All three parties of the expedition have been provided with complete field magnetic instruments suitable for polar observations, one in particular suitable for work in the vicinity of the South Magnetic Pole which they hope to locate definitely. The U. S. Coast and Geodetic Survey has made the necessary plans, trained the scientific staff, and furnished two scientific members of the expedition.

The American Geographic Society and a large group of other agencies are sponsoring an expedition to Graham Land under the leadership of Commander Finn Ronne, U. S. N. R. In addition to a vigorous aerial mapping program a rather thorough scientific program is planned. Two bases will be established. For the more northerly station the U. S. Coast and Geodetic Survey has supplied a seismograph and recorder, the Weather Bureau a most complete set of meteorological instruments, Harvard University a cosmic-ray meter, and the Department of Terrestrial Magnetism a set of field magnetic instruments. Magnetic directions during the aerial reconnaissance will be controlled by eye-readings of declination at the base station. From the more southerly base, exploring expeditions will investigate the unexplored regions to the southwest and undertake a broad series of field magnetic observations in that area.

COSMIC RAYS

With the return of peacetime conditions, the resumption of cosmic-ray research may be expected, particularly in the field of high-energy radiations in the study of which natural cosmic radiation may be employed.

The programs, carried out with the support of the Committee on Coordination of Cosmic-Ray Investigations, at the Department of Terrestrial Magnetism of the Carnegie Institution of Washington, at the Bartol Research Foundation of the Franklin Institute, at the California Institute of Technology, at the University of Chicago, and at the New York University, have been pursued to the extent permitted by the conditions of emergency and reconversion. The cosmic-ray meters and the five widely distributed points (Cheltenham, Huancayo, Teoloyucan, Christchurch, and Godhavn) have been successfully maintained. For the California Institute of Technology, Dr. R. A. Millikan states that a vigorous start has already been made in the program of counter-registered flights to the top of the atmosphere in the area between Oklahoma City and Saskatoon. These flights are very important because it is in this latitude range that the predictions of Millikan and his colleagues locate the incoming hydrogen rays, and it is the last and most critical latitude in which their theory of the origin of cosmic rays has not been checked. It will not, however, be possible to start on the expedition until a satisfactory improvement of the reliability of counters has been achieved. It is possible, therefore, that the flights may not take place until some time in 1947.

The cosmic-ray data obtained at the station at Teoloyucan (altitude 2,285 meters) in Mexico show certain unexplained anomalous features as compared with the records from the four other stations. They seem to be at variance with the accepted hypothesis of variation with geomagnetic latitude. In order to confirm these findings or to provide a means of explaining them, a meter has been installed at Rio Piedras (Puerto Rico), which is in approximately the same latitude as Teoloyucan but at sea level.

In about ten years of continuous records, three abrupt increases of from 8 to 20 per cent in the cosmic-ray intensity have been observed. Each of these unusual increases began one hour or less after solar flares, with simultaneous radio blackouts lasting for several hours. Magnetic records on the night side of the Earth indicate no significant change in the field at the time of the fade-outs yet the cosmic-ray records show that the increases occurred simultaneously on the day and night side. These increases do not correspond to the pattern of a variation due to large currents in the ionosphere arising from ultraviolet ionization (which only enhance the regular diurnal variation on the day side of the Earth) and hence they do not seem to be ascribable to changes in the magnetic moment of the Earth. It is difficult to imagine very large changes in the magnetic moment of the Sun due to a flare. The most reasonable hypothesis to date is that the cosmic-ray "Sun bursts" are due to particles accelerated in some way by the flare itself, possibly by some obscure "betatron action" in the vicinity of the Sun (or within the flare). The particles are emitted from the Sun with sufficient energy to reach the Earth at magnetic latitude 48° but not at the equator, hence high in the energy band between 10^9 and 10^{10} electron volts. If it should be definitely established that these increases are due to particles acquiring their energy from some such process on the Sun, then similar processes on the stars might possibly account for all cosmic radiation.

With the report for the year ended June 30, 1946, the Committee for Coordination of Cosmic-Ray Investigations, formed in 1932, concluded its functions and the administration of its unfinished activities were entrusted to the Department of Terrestrial Magnetism.

IONOSPHERE

Rapidly moving ionospheric clouds have been detected in the Earth's outer atmosphere (ionosphere) during magnetic storms—times when the ionosphere undergoes marked fluctuations which result in the fading or even the disappearance of radio signals. These clouds of charged or ionized matter enter the ionosphere, moving in from long to short range and out again in a few minutes. They are of fundamental importance because of their effects on radio transmission. The cloud form travels at velocities of from 1 to 2 km per second although the constituent particles no doubt move very much faster. With the aid of the new photographic panoramic ionospheric recorders, developed at the Kensington Ionospheric Laboratory (DTM, CIW), it is possible to obtain individual photographs of ionospheric activity at adjustable intervals of 5 to 30 seconds. The technique has been perfected to the extent that successive records can be projected as motion pictures. Thus the results may be presented visually, facilitating interpretation and study and providing means for study of special ionospheric features which occur during magnetic storms, eclipses, radio fade-outs, etc. It is thus possible, through projection, to study rapidly an enormous number of data, select portions for critical study, and visualize dynamic events of short duration. This method is also susceptible of other applications in research and education.

The measurements at the station at Maui, Hawaii, belonging to the world network of ionospheric stations set up by the Wave Propagation Committee of the Combined Communications Board, showed a striking increase in noise with field intensity recorded on approximately 15 megacycles during a radio fade-out and solar flare suggests a solar origin of the noise.

The Department of Transport of Canada, in connection with the Canadian Wave Propagation Committee, is operating ionospheric stations at Clyde, Churchill, Chelsea, Prince Rupert, and St. Johns, Newfoundland, as well as a mobile station between Churchill and Winnipeg. This group constitutes the Canadian portion of the world network of ionospheric stations.

INTERNATIONAL MEETING

An extraordinary General Assembly of the International Union of Geodesy and Geophysics at Cambridge, England, July 19 to Aug. 2, 1946, was attended by delegates from 16 countries. A draft agreement for scientific collaboration between the International Council of Scientific Unions and UNESCO was approved. A Committee on Social Value of Earth Sciences was also approved. A Union report volume on operations of the Union and its associations, including the Association of Terrestrial Magnetism and Electricity, from 1939 through 1946, is being prepared for publication early in 1947. The Eighth General Assembly of the International Union of Geodesy and Geophysics and its associations will be held in Norway, Sept. 5-15, 1948.

DR. FLEMING'S RETIREMENT

Dr. John Adam Fleming who has been connected with the Department of Terrestrial Magnetism since its establishment in 1904, becoming its Director on Jan. 1, 1935, retired June 30, 1946. During his long association with the Department, he has taken a major part in the important enterprises which have resulted in outstanding contributions to the sciences of geophysics. He has also been General Secretary of the American Geophysical Union since 1925 and President of the International Association of Terrestrial Magnetism and Electricity since 1930. Dr. Merle A. Tuve, Chief Physicist, Department of Terrestrial Magnetism, became Director July 1, 1946.

PUBLICATIONS

Publications dealing with terrestrial magnetism by the U. S. Coast and Geodetic Survey include its "Isogonic chart for 1945, United States." [This chart bears the same number as the edition of 1940 (No. 3077) but it is drawn on a new base-map]; "Magnetic observations in the American Republics, 1941-44"; "Magnetic observatory results at San Juan, for 1929-30"; "Magnetic observatory results at College, near Fairbanks, Alaska, for the second Polar Year October 1932 to March 1934." The Survey's Serial 644 "Magnetic declination in the United States 1945" and the "Magnetic observatory results at Honolulu, Hawaii, for 1937-38" are in the press. There are also being published by the U. S. Hydrographic Office, complete world magnetic charts for all elements based on data resulting from the comprehensive analyses of world-wide magnetic observations since 1905 which have been prepared by the Department of Terrestrial Magnetism.

The American Geophysical Union held its 25th annual meeting in Washington, May 27 to 29, 1946. Its *Transactions* have been issued regularly in bimonthly parts, each of which includes original papers, progress-reports, reviews, abstracts, and bibliography, information pertaining to the Union, and notes of interest to geophysicists.

The quarterly journal *Terrestrial Magnetism and Atmospheric Electricity,* published by the Johns Hopkins University Press, completed its 51st annual volume in 1946. It contains original contributions to geomagnetism and geoelectricity and allied subjects, sections on magnetic storms, magnetic character-figures, notes, reviews, and lists of recent publications.

Geophysics, the quarterly official publication of the Society of Exploration Geophysicists, completed its 11th annual volume in 1946. This journal is devoted to general and applied geophysics, and in its pages are found papers dealing with the magnetic and electric methods of geophysical prospecting.

The last two of the 13 volumes of *Scientific Results of Cruise VII of the Carnegie* during 1928-1929 under command of Capt. J. P. Ault, have been published by the Carnegie Institution of Washington. The first of these contains the "Ocean atmospheric-electric results," the second a series of papers on the "Work of the *Carnegie* and suggestions for future scientific cruises." "Magnetic results from Watheroo Observatory, Western Australia, 1919-1935," being Volume VII-A of the Researches of the Department of Terrestrial Magnetism, is now in press.

METEOROLOGY AND CLIMATOLOGY

By F. W. Reichelderfer
Chief, United States Weather Bureau

GENERAL

In the field of meteorology and climatology, the year 1946 marked the resumption and expansion of normal activities, as the pendulum swung away from wartime emphasis on military applications of the weather sciences back to increased service to the general public and private interests, especially commercial aviation. The U. S. Weather Bureau experienced a considerable increase over 1945 in requests from the public for weather advice. This appears to be owing to an aroused interest in the subject, responding to the restoration of full peacetime distribution of weather information and to the recent rapid expansion of domestic and international air traffic.

The year also brought increased civilian use of instruments developed during the war which utilize discoveries in fields such as electronics. The return of veterans well trained in meteorology has provided governmental and private weather services with new personnel of a caliber not hitherto available on a general scale. The training of meteorologists, though greatly curtailed in comparison with the war years, is nevertheless much superior in scope to pre-war instruction.

INSTRUMENTS AND OBSERVATIONS

Until recently, no completely satisfactory means has been available for determining the height of a cloud ceiling during daylight. At least a partial solution to this problem has come with the employment of the ceilometer, an instrument which uses a modulated light beam and a sensitive electronic detector to measure ceiling heights day or night. This device also follows the light beam through a thin cloud layer, making it possible to measure the thickness as well as the height of thin clouds and, at times, the height of a second layer above.

An important advance in upper air observation is the use of radar equipment to track a target attached to a free balloon and thereby to obtain the speed and direction of the winds aloft. A related development is the "rawinsonde" observation, a combination of pilot balloon and radiosonde techniques. As the radiosonde, carried aloft by balloon, transmits to the ground station data on atmospheric pressure, temperature, and humidity, its impulses are tracked by sensitive direction-finding devices and the velocity of the winds moving the balloon are computed. The Army and Navy have successfully used radar in the detection of cold fronts, thunderstorms, hurricanes, and other phenomena; present Weather Bureau plans envisage the installation of radar at 31 stations throughout the country. Prospects appear excellent for the widespread employment of radar as a forecaster's aid, particularly in the local short-term forecasting of showers, thunderstorms, and squall lines. These recent developments in meteorological instruments are summarized by A. F. Spilhaus (*Bul. Am. Met. Soc.*, Vol. 27, pp. 399-409).

Finally, mention should be made of the notable value of the weather ships maintained in the Pacific by the U. S. Navy and Coast Guard. Before the installation of this service as a military measure, forecasters in the United States had only a small number of ship reports, confined to a few steamer lanes, as sources of information on weather developments over the vast Pacific. Since storms in our latitudes travel largely from West to East, the observational data supplied by the dozen weather vessels, stationed widely over the ocean, are of considerable assistance in forecasting for the North American area.

THUNDERSTORM RESEARCH

Hand in hand with the exploration of new instrumental and observational techniques goes investigation of special phases of meteorology. To acquire basic knowledge of the thunderstorm, one of the most serious hazards to aviation, a joint program was undertaken during the year by the Army, Navy, National Advisory Committee for Aeronautics, and the Weather Bureau. The first part of the project was conducted near Orlando, Fla. in an area subject to maximum thunderstorm activity of a rather simple, cellular type. A network of 56 ground stations recorded complete atmospheric data as thunderstorms moved over the test area. Aircraft and gliders, equipped with the various instruments needed to observe conditions in the storm clouds themselves, were flown through at various intervals and at different levels. The second phase of the investigation will involve a similar analysis of middle latitude continental thunderstorms. It is expected that the entire project will be concluded by June, 1948.

THEORETICAL RESEARCH

Turning to research of a theoretical nature, it is found that studies of convergence and divergence, vertical motion, and the mechanism of pressure changes have been vigorously conducted at a number of the universities. These topics are both closely interrelated as well as intimately connected with such important problems as the formation of clouds and precipitation and the processes of cyclogenesis and anticyclogenesis. The effects of divergence and advection on the lapse rate were investigated by a New York University group, including Fleagle (*J. Meteor.*, Vol. 3, pp. 9-13) and Panofsky (*J. Meteor.*, Vol. 3, pp. 45-49). At the Massachusetts Institute of Technology, research into the mechanism of pressure changes was directed by Haurwitz and Austin (*J. Meteor.*, Vol. 3, pp. 57-77); the advective method of preparing prognostic pressure charts was tested under the supervision of Haurwitz and Malone (*J. Meteor.*, Vol. 3, pp. 83-93); and Haurwitz examined the relation between the wind field and pressure changes (*J. Meteor.*, Vol. 3, pp. 95-99), with the conclusion that the concept of the isallobaric wind should be abandoned. Similar studies were conducted elsewhere but their results remain unpublished.

In the field of long-range forecasting, the Weather Bureau and the Massachusetts Institute of Technology are continuing their joint study of methods for preparing forecasts of mean weather conditions for periods two to six days in advance. Progress along these lines is hampered by inadequate knowledge of the general circulation of the atmosphere, a problem now being attacked by the meteorological staff of the University of Chicago. Two recent contributions to extended forecasting research are an examination of the normal fields of convergence and divergence at the 10,000-foot level by Namias and Clapp (*J. Meteor.*, Vol. 3, pp. 14-22) and Rossby's discussion of the energy and frequency propagation in certain types of plane waves in the ocean and in the atmosphere (*J. Meteor.*, Vol. 2, pp. 187-204).

At the Institute for Advanced Study at Princeton, exploratory studies have been initiated on the use of the electronic computer for the rapid solution of complex meteorological problems, hitherto unsolvable by ordinary methods of calculation. It is hoped that this project may lead to worthwhile techniques for numerical weather prognostication and may serve to expedite research on general circulation problems.

The recent pioneer work on rockets, guided missiles, and high altitude aircraft has underscored the need for pooling and enlarging present scanty knowledge of the physical processes and circulation patterns of the atmosphere 100,000 feet and higher. Isolated workers in various sciences have conducted investigations along special lines, but there remain as yet unattempted the tasks of correlating the data, checking their internal consistency, formulating a concerted system of research, and developing techniques for forecasting physical changes in the high atmosphere. A start has been made towards organizing such a comprehensive program, however, and it is believed that the meteorologist, because of his experience in analysis and forecasting for the lower atmosphere, is in a position to contribute much to its success.

METEOROLOGICAL TRAINING

During the war more than 5,000 students were trained in advanced meteorology through intensive one-year professional courses conducted at several American universities. The majority of this group became Army and Navy weather officers, and they have now been practically all released from the armed forces. With the exception of 300 or 400 who have been engaged as meteorologists by governmental agencies, universities, airlines, and other organizations, or have returned to school for advanced meteorological study, nearly all of these veterans have given up meteorology for other lines of work. Most of them have resumed careers interrupted by the war.

Prior to 1940 very few educational institutions offered undergraduate curricula leading to a degree in science with a major in meteorology. As a result of experience gained during the war training program in meteorology and of the recognition of the need for basic college instruction in the science, the majority of the schools having graduate courses in meteorology now offer undergraduate curricula as well. Such programs provide individuals with the type of training for junior professional work in the field that has been available to students in other geophysical sciences, and equip them with a well-planned basis for graduate study.

On the graduate level, training has expanded greatly over the pre-war period, when only a handful of advanced students were regularly enrolled at each of the several universities having a graduate meteorology department. At present there appear to be about ten students working toward an advanced degree in meteorology for every one so engaged before the war. This increase will undoubtedly have a very beneficial effect on meteorology as a whole, by providing an adequate number of well qualified personnel for research and teaching, functions which the intensive war courses did not wholly satisfy, since they were necessarily oriented towards practical military requirements.

INDUSTRIAL METEOROLOGY

A number of newly established private weather services are engaged in supplying business interests with specialized weather information. These private concerns supplement the work of the Weather Bureau, which has pioneered in applying meteorological and climatological aids to the development of agriculture, transportation, and industry, but being a government agency it is not in a position to give specialized service to all business groups in all locations. The private weather firms are granted permission to receive weather data by teletype from the government-controlled lines. Most of them are engaged in furnishing special forecasts of weather developments likely to affect the operations of their clients, but the anticipated widespread integration of climatological factors with business planning has yet to be effected by these private weather services. In expanding their new field, private weather consultants are faced with the problems of correlating a combination of changing weather elements with sources of gain or loss for a particular industry, maintaining a constant and reliable liaison to warn their clients of unusual developments, and conducting "on the spot" investigations of means to improve both the scope and detail of their service. Indications are that the private practice of industrial meteorology will in time exercise a considerable influence on the national economy.

CLIMATOLOGY

One of the significant trends observed in this science during the year was the increased demand on the Weather Bureau for specialized application of climatological data in the fields of aviation, shipping, agriculture, commerce, and industry.

To keep abreast of this demand, a program has been initiated in the states of Louisiana, Mississippi, Arkansas, Oklahoma, and Texas, which is to be extended eventually to the whole country. This program is the machine tabulation of weather observations, which not only is more economical of time than the manual methods of compilation heretofore used, but also allows more complete analysis of the data. In the past, climatological compilations have been limited almost entirely to such simple statistical elements as averages, extremes, and accumulated totals. Machine tabulation will provide complete summarizations, including frequency distribution and probability of important climatic elements in various forms, in accordance with the needs of the particular interest being served. As a result of the extensive climatological studies conducted by the Army and Navy, using machine tabulation methods, a library of 60,000,000 punched cards representing observations made in this country and abroad has already been created. Such developments as these point the way to future integration of previously unconsidered climatic factors with standard planning in a host of activities, of which building construction, airport designing, farm management, and consumer goods handling are only a few.

PUBLICATIONS

Works of interest to meteorologists appearing during 1946 include *Meteorology, with Marine Applications,* by W. J. Donn, and a *Handbook of Meteorology,* by Beers, Berry and Bollay, both published by McGraw-Hill of New York. A long felt need was met by the *Weather Glossary* compiled by A. H. Thiessen and published by the Weather Bureau.

A loss in the field of periodicals was the *Journal of Aeronautical Meteorology,* which suspended publication as of December, 1946.

AMERICAN EXPLORATION

By Robert M. Brown
Professor, Rhode Island College of Education

AMERICAN GEOGRAPHICAL ANTARCTIC EXPEDITION

Commander Finn Ronne, who was second in command on one of the Byrd Expeditions, planned to set out late in 1946 for Marguerite Bay on the Palmer peninsula as leader of an expedition under the auspices of the American Geographical Society of New York City to the Antarctic. The party expects to arrive before March 1, 1947 so that adequate preparations for the winter may be made. It is hoped that the camp and equipment left there in 1941 by Admiral Byrd will be available. An operational base from which field operations will be conducted will be established at the base of Palmer peninsula some 200 miles south of Marguerite Bay. The expedition sailed in an 183-foot wooden vessel from the Navy supply, of sturdy construction, and in addition to the crew there was a scientific personnel consisting of biologists, geologists, physicists, climatologists, etc.

A thorough study of the unexplored area between 35 degrees and 80 degrees, west longitude, and from the occupational base to the South Pole, in the northeastern quadrant of Antarctica is planned. Among other objectives are a search for the southern boundary of Weddell Sea; some decision on the question of the possible extension of Weddell Sea to Ross Sea thus dividing Antarctica; the collection of data on ice, wind, and water movements to provide a better understanding of weather conditions; sampling of polar animals and birds for study in museums; and the study of oil and mineral resources. The expedition plans to be gone two years. It was equipped with two or three airplanes, a snowmobile, and dog sledges.

BYRD ANTARCTIC EXPEDITION

Admiral Richard E. Byrd is in charge of an Antarctic expedition which includes 4,000 officers and men of the Navy and more than a dozen vessels, designed in part to train personnel and equipment in polar temperatures and to continue investigations of a scientific and exploratory nature left undone by the American expedition of 1939-41.

The expedition in three divisions left early in December, 1946, and plans to return in March, 1947. One division under Capt. Richard H. Cruzen, second in command to the Byrd Expedition of 1939-41, includes the flagship *Mount Olympus,* Coast Guard ice-breaker *Burton Island,* cargo ships *Yancey* and *Merrick,* and a submarine, the *Zennet.* Another division under Capt. George F. Dufek, naval aviator and a member of a former Byrd Expedition, includes the seaplane tender *Pine Island,* the oiler *Canisteo,* and the destroyer, *Brownson.* The third division commanded by Capt. Charles A. Bond, veteran of the Aleutian campaign, is made up of the seaplane tender *Currituck,* the oiler *Cacapon,* and the destroyer, *Henderson.*

A base will be established on the Ross Sea and the aircraft carriers will launch the aircraft for flight operations. Altogether the expedition is well equipped to do a maximum amount of work in many lines during the short Antarctic summer.

MACMILLAN ARCTIC EXPEDITIONS

Donald B. MacMillan with sixty specimens of birds for the Colorado Museum of Natural History, returned in late summer from his twenty-fourth Arctic Expedition on the *Bowdoin.* Plans are now in progress for his twenty-fifth trip with geologists, botanists, anthropologists, and ornithologists, along the Labrador Coast. Baffin Land, and Greenland to within ten degrees of the Pole, to sail in mid-June, 1947.

DAHLGREN CUBAN EXPEDITION

Dr. B. E. Dahlgren, chief curator of the Department of Botany, Chicago Natural History Museum, has returned from an expedition to Cuba, where observations on a genus of palms especially represented on the island were made. Photographs and materials for study were obtained and also collections for exhibit and for the herbarium of the Museum.

MEXICAN EXPEDITIONS

Alfred L. Rowell, artist on the staff of the Department of Anthropology, Chicago Natural History Museum, was in Chichen Itza, Mexico during the summer of 1946. Buildings at Chichen Itza were excavated and restored during 1926-1929 by Dr. Paul S. Martin of the Carnegie Institution of Washington, D. C., and Rowell has in preparation a miniature diorama of this ancient Maya village for the Museum.

Karl P. Schmidt, chief curator of Zoology, Chicago Natural History Museum, continued in 1946 collections begun in 1945 in the Mexican state of Coahuila. It planned to make a complete study of the animal life of this region, and Schmidt was engaged also in making a reconnaissance for future explorations.

Charles Bogert, curator of the department of Amphibians and Reptiles of the American Museum of Natural History, left New York in August in a search for rare aquatic rattlesnakes reported to inhabit certain Mexican lakes and to collect varieties of snakes and lizards not now represented in the Museum's study collection. The expedition will in addition set up "blinds" to study living lizards and to record their actions day by day. The personnel includes Dr. Albert P. Blair, assistant curator of the department of animal behavior, who will study phases of the reproductive biology of toads and other amphibians; Dean Amadon, assistant curator of birds, who will collect and observe birds; Dr. John Moore, associate professor of Biology at Barnard College, who will collect frogs later to be crossed with native North American species in hybridizing experiments; Dr. Karl Schmidt to continue his studies on the extent and distribution of certain reptiles; and Rodolphe Ruibal, Harvard student, will act as field assistant.

EL SALVADOR, NICARAGUA, HONDURAS

Dr. Margery C. Carlson, assistant professor of Botany, Northwestern University, led an expedition to Ahuachapan, El Salvador, to collect plants. Little is known of the flora of this region and the collection will fill a gap in the knowledge of Central American flora. Besides the flowering plants, collections of algae, fungi, and certain forms of beetles will be attempted. With Dr. Carlson, Miss Kate Staley will go as assistant. The expedition is sponsored by the Chicago Natural History Museum and Northwestern University.

Paul C. Standley, curator of the Herbarium, was in Nicaragua, Honduras, and El Salvador on an eight months' botanical survey and Frank C. Wonder, staff taxidermist, in Trinidad to make a general collection of mammals, reptiles, amphibians, and birds. Both are from the Chicago Museum of Natural History.

PERU

Donald Collier, curator of South American Ethnology and Archaeology of the Chicago Natural History Museum, left Chicago in May for Peru where he will supervise excavations to collect materials representative of early Mochica and Chavin pre-Inca cultures. These tribes of about A. D. 500-1,000 inhabited a desert area between the Peruvian coast and the Andes.

Colin C. Sanborn, curator of mammals of the Chicago Natural History Museum, conducted the Peruvian Zoological Expedition of 1946 to continue the surveys of two expeditions during the period 1939-1942, which were interrupted by the war. Sanborn spent his time in the jungle area of Amazonian Peru where he collected mammals, amphibians, and reptiles. A brief period was spent at Lake Junin, over 14,000 feet in altitude where land snails and small mammals of especial interest, and large and peculiar frogs were found. Of special significance is a rare animal, the Bassariscyon allemi (apparently so rare as never to have acquired an English name) obtained by Sanborn. This is a raccoon-like animal which ranges from Costa Rica to Central Peru. The Bassariscyon was not desired for exhibition purposes but for anatomical studies to establish relationships between it and certain other animals such as the panda and bear.

Junius B. Bird, assistant curator of Archaeology in the American Museum of Natural History, is in Peru to seek evidence of non-agricultural peoples who lived some thousands of years ago in a valley near Trujillo. It is expected that coordination of geographical, archaeological and ethno-sociological data will result in a broad study of culture changes and adaptations since several scientists of other institutions will join Bird. Dr. William D. Strong of Columbia University will study the chronology of the ceramics; Dr. Wendell C. Bennett of Yale University will concentrate on the architectural features of the ancient adobe structures; Dr. Gordon R. Wiley of the Smithsonian Institution will survey present-day land utilization for an estimate of former populations; and Bird will search for remains of the earliest pre-pottery cultures never before found in Peru.

John C. Pallister, Department of Insects and Spiders, American Museum of Natural History, left in September for Peru to study the insect life of the remote Cordillera Azul and Pampa del Sacramento plateau country. This expedition, it is announced, will mark the beginning of a planned series of entomological expeditions throughout Latin America for the purpose of acquiring scientific study collections. The last civilized stopping place for the expedition will be the small village of Tingo Maria in the Peruvian interior. From this point the expedition will proceed to the more inaccessible territory to be studied. It is expected that about 300,000 specimens of beetles, flies, bees, butterflies, moths, spiders, and scorpions will be collected. An intensive search will be made for some very rare species of mammoth moths of the family Saturnidal which attain wing-spreads of seven inches. Felix Woytkowski, a leading professional insect collector, will accompany Pallister.

COLOMBIA

Dr. R. A. Stirton, University of California, has returned from a geological study of the eastern slopes of the Colombian Andes and reports that the llanos covering more than half of Colombia is expanding. There is evidence of a gradual geological uplift of the plain area and the burning of the grasses of the plain burns part of the bordering jungle; thus from these two causes the plains lands are increasing in area. Dr. Stirton states that the soil is good and the foothill climate is agreeable notwithstanding its low latitude, and he believes with good transportation facilities the area has great promise as a cattle raising country.

VENEZUELA

Dr. William Beebe led the forty-sixth expedition of the Department of Tropical Research of the New York Zoological Society which left New York during February and returned in September. The researches begun in 1945 were continued at Rancho Grande, a great building erected by Dictator Gomez in the heart of the National Park jungle at 3,500 feet elevation in the northwest part of Venezuela. The expedition was made possible by the Government of Venezuela and the Creole Petroleum Corporation. The members of the Department's staff were

Jocelyn Crane, research zoologist, and Henry Fleming, entomologist. Observations were concentrated on the ecology of the fauna and life histories of vertebrates and insects. Collections were made whenever necessary.

AFRICA

Mr. Lerner, a trustee and field associate in the department of fish and aquatic biology, American Museum of Natural History, left in October for Nairobi, Kenya Colony, to search for unusual fresh water fish in little known lakes in the interior of Africa. In addition Mr. and Mrs. Lerner will conduct a big game expedition in Kenya Colony and Tanganyika to collect wild life specimens for the Nova Scotia Museum. The Lerners will use a "walkie-talkie" radio equipment in the hunt for big game. This two-way communication system will be a help in the field in spotting game and in maintaining contacts within a range of five miles between groups of the expedition during hunting and collecting trips.

Hugo Rutherfurd led the Rutherfurd-African expedition on a Cape Town-to-Cairo trip by jeep and supply truck to photograph African natives and wild life. He was accompanied by his wife and T. Donald Carter, assistant curator of the Department of Mammals of the American Museum of Natural History. The expedition plans to be in the field for about a year. Certain specimens of mammals needed by the Museum will be sought but the main objective is to make extensive technicolor motion pictures of Africa for educational purposes. Rutherfurd plans to photograph native life in various African communities which can be used in every level of school life; visual teaching aids on the customs, economics, and art of races and peoples; family relationships and events of daily life such as foods and cookery, clothing, agriculture, housing, hunting, trade, music, dancing, and craftsmanship. At "blinds" near waterholes moving pictures of wild animals will be taken.

Arthur Vernay, field associate of the Department of Mammals of the American Museum of Natural History, returned in October from a collecting trip in Nyasaland. The expedition collected a few unusual specimens of large game, but in general it concentrated on collections of small mammals such as shrews, mice, squirrels, and others. Altogether more than 1,800 specimens of mammals and an equally well-rounded and extensive collection of reptiles were obtained. Dr. Harold E. Anthony of the Department of Mammals, Leonard Brass of the New York Botanical Gardens, and Capt. Guy Shortridge, director of the Kaffrarian Museum of King William's Town, South Africa, accompanied Vernay. Brass made an extensive collection of botanical specimens. The expedition was in the field about five months, from May to November of 1946.

OCEANOGRAPHY

By L. P. Disney
U. S. Coast and Geodetic Survey

GENERAL

The year 1946 was a period of transition in oceanographic work from military application to that of more general research. The reconversion was slow, and in a number of fields normal activities probably will not be resumed before 1947. Because of the classified status of oceanographic work during the war no reviews were published for the years 1944 and 1945. Brief references to accomplishments during the war, consequently, are included in this review.

HYDROGRAPHIC OFFICE

To continue on a broader basis the oceanographic program developed during the Second World War, the Secretary of the Navy approved the establishment of the Division of Oceanography within the Hydrographic Office on Jan. 29, 1946. The Division of Oceanography is responsible for collecting and codifying oceanographic data and for preparing charts, manuals, and special reports of an oceanographic nature for the Navy Department, other government agencies, the Merchant Marine, the airlines, and others. In cooperation with the Office of Naval Research, the Division will coordinate the oceanographic programs of the Navy Department and promote training and basic research at universities and oceanographic laboratories. In order to carry out this mission a governmental Advisory Committee on Oceanography has been established with representatives from all government agencies concerned and will meet at least twice a year. The fields of interest cover virtually all phases of Oceanography although the greatest emphasis will be on physical and geological programs. A quota of nine professional billets was established for the current fiscal year.

During the Second World War a great deal of oceanographic work directed towards military application was carried on at universities and private oceanographic laboratories under contract with OSRD, the Hydrographic Office and the Bureau of Ships. Because of the many benefits arising from this procedure it is being continued with funds provided by the Hydrographic Office and the Office of Naval Research but with a change in emphasis from problems of immediate military interest to those of a more basic character.

As 1946 represented a period of transition relatively few new studies were completed. Although many of the topics investigated during the Second World War have been declassified, only a few reports have yet been completed for publication by the Hydrographic Office. Additional reports are being published by the institution and individuals that conducted the investigations. Many topics concerned with sea, swell, and surf, permanent and tidal currents, distribution of temperature, character of beaches, etc. studied by short-cut methods during the war emergency are now being examined in greater detail so that conclusions can be established theoretically as well as by empirical observations.

COAST AND GEODETIC SURVEY

The oceanographic work carried out by the Coast and Geodetic Survey during the past few years was for areas of strategic importance to the armed forces. Along the Atlantic Coast the work was generally confined to coastal waters used by shipping and anchorages for naval vessels. Surveys were executed for speed trial courses and for beach areas used by the armed forces for amphibious training. Wire drag and other surveys were made to locate and determine the least depth over wrecks in shipping lanes. Along the Pacific Coast hydrographic surveys were made in the vicinity of Seattle, the Straits of Juan de Fuca, southeastern Alaska, the Alaska Peninsula, and along the Aleutian chain from Dutch Harbor as far west as the international boundary west of Attu.

Developments in the field of electronics have been investigated for possible use in oceanographic work. Sonar equipment, used during the war principally for locating submarines, has been utilized by survey ships to locate shoals, wrecks, and obstructions. Reflecting radar, installed on several ships, has been used for navigation and reconnaissance hydrographic surveys since 1944. Shoran equipment developed during the war for precise bombing has been adopted to use on hydrographic surveying. It makes possible hydrographic surveying during poor visibility, fog, or darkness by measuring electronically distances from a surveying ship to the known locations of two shore stations.

Two important innovations have been introduced recently on nautical charts to facilitate the use of electronics in position finding. The first is the use of gradient tints, in addition to closely spaced contours, to bring out vertical land relief. Shades of brown, with the darkest at the highest elevations, have served effectively in making the relief discernible. Gradient tints have been used experimentally on a number of Pacific Coast charts.

Secondly, the use of the Loran (long-range navigation) method of position finding at sea has called for a modification of the nautical chart. To facilitate the use of the instrument there has been added to the nautical chart a grid of Loran lines of position which are in exact registry with the chart information. To avoid obscuring the standard nautical information, the Coast and Geodetic Survey is printing for experimental purposes the Loran grid on the reverse side of North Atlantic Coast Sailing Chart No. 1,000. The Loran position can be obtained on this grid and the point pricked through to indicate its position in reference to the charted detail.

Tidal work of the Bureau during the years of war was directed towards military application. At the request of the Navy, current surveys were made for use in connection with the launching of ships, testing of torpedoes, and the construction of port facilities. Detailed tide and current reports for particular areas were prepared for JANIS (Joint Army-Navy Intelligence Studies). Special tide and current predictions were calculated for strategic places and a number of special tide and current tables were published for combat zones. Also published for use in planning operations were monthly tide and light diagrams showing the relation between the stage of the tide and sunlight, moonlight or darkness.

Tidal records together with temperature and density observations of sea water from a number of ports in Central and South America are being obtained through the participation of the Coast and Geodetic Survey in the State Department program of cooperation with American Republics. During the past year new tide stations were established at Puerto, Mexico and Progresso, Mexico.

In an analysis of records from some 20 tide stations in the eastern Pacific, covering a stretch from 57°N. latitude to 33°S. latitude C. K. Green in his paper on "Seismic Sea Wave of April 1, 1946, as Recorded on Tide Gages" (*Transactions,* American Geophysical Union., Vol. 27, No. 4, August 1946) shows that the average ratio of initial rise to succeeding fall of the water was one to three, which may account for the frequent mention of an initial recession by eyewitnesses. Computed travel-time curves are shown to be in good agreement with the observed times of arrival of the seismic sea wave. The average velocity of the wave from the epicenter off the Aleutian Islands to Valparaiso, Chile, a distance of some 8,066 miles, was 445 statute miles per hour. The period of the seismic sea wave for the nearer stations averaged 15 minutes, while for the farther stations it averaged 17.4 minutes.

COAST GUARD

During the war years no oceanographic program was carried out by the Coast Guard. However, a Coast Guard officer working under the Commander-in-Chief, U. S. Atlantic Fleet (Commander, Task Force 24) performed ice observations by air scouting and collected information on the distribution and relative quantities of ice in the Atlantic. The regular International Ice Patrol was resumed during the 1946 season although no oceanographic program was carried out. The patrol simply observed and charted the ice. It is of interest to note that the air observation of ice is a wartime development which will be continued in addition to the use of the patrol vessels. Several times a week a patrol aircraft scouts the limits of the ice field, thus giving a much more comprehensive picture of the ice than had heretofore been obtainable. The Coast Guard Oceanographic program in connection with the International Ice Patrol will be reactivated in 1947.

SCRIPPS INSTITUTION OF OCEANOGRAPHY

War research during the years 1944-1946 was devoted to two major investigations:

(1) Oceanography of the surface layers of the Pacific with special reference to problems in submarine warfare. In connection with this study monthly charts of sea-surface temperatures and currents were prepared, many of which have been published by the Hydrographic Office. Besides preparing special compilations, detailed studies of the oceanographic conditions around the islands of Japan have been conducted, leading to a better understanding of the oceanic circulation in these waters. Studies of the boundary layer atmosphere-ocean have led to a theoretical examination of the transformation of polar continental air to polar maritime air. It has been shown that, when cold air flows over the water, static instability is maintained in the sea with temperature slightly increasing and salinity slightly decreasing with depth.

(2) Problems related to forecasting of sea, swell, and surf. On the basis of a theoretical study of the growth of waves under the influence of wind, definite relationships were established between wind, fetch, and duration on the one hand, and wave characteristics on the other hand. Furthermore, rules for the advance and decay of swell were arrived at. The transformation of waves as they travel from deep to shallow water and the relation between swell and surf were examined. Methods were developed for the forecasting of surf conditions on any given beach provided that the character of the swell in deep water, the configuration of the coast line, and the bottom topography were known. The different methods were used extensively during the war for forecasting sea, swell, and surf conditions.

Work on these two topics is being continued under contract with the U. S. Navy Hydrographic Office.

During the year 1946 the general research activity has remained greatly curtailed because many of the staff members were still on leave with the armed forces or on leave in civilian work. Studies have been primarily in the fields of marine bacteriology and physiology of marine organisms.

WOODS HOLE OCEANOGRAPHIC INSTITUTION

The major investigations undertaken during the war period covered the following studies:

(1) Anti-fouling paints and fouling organisms. One phase of this study has provided much new information on the depth and distance from shore at which fouling is to be expected, the relation of temperature to its rate of growth, and the geographical limits of the occurrence of the various species.

(2) Temperature distribution in the surface layers of the North Atlantic. Improvements in the bathythermograph were developed to the point where reliable temperature-depth curves down to roughly 150 meters could be secured from vessels traveling at speeds up to 20 knots. The application of the bathythermograph to subsurface warfare was such that the Navy procured and put into routine service a considerable number of these instruments.

(3) Air turbulence and convection over the ocean. Studies were centered around the problem of predicting the performance of smoke screens over the water, and especially in gaining a better understanding of the relatively complicated thermal structure which may exist in the lower air near a beach.

(4) Sea, swell and surf. A wave period analyzer was constructed which has great promise in the future of wave research.

(5) Underwater acoustics. From the oceanographic standpoint, perhaps the most interesting development in underwater acoustics is the system proposed for locating survivors at sea. The basic ideas involved have recently been made public by the Navy Department under the code name SOFAR.

(6) Seismic Refraction Measurements in Shallow Water. High qual-

ity of records obtained has served to clarify many problems of the transmission of sound waves both in the water and through the bottom.

(7) Underwater explosive phenomena. Much of the work centered around the problem of developing better gauges for measuring the pressure wave produced by an explosion both in the air and in the water.

The reconversion of the Institution to a peacetime basis during 1946 has been seriously postponed by the Navy's request that some 35 members of the staff be assigned to studies of the oceanographic aspects of the atomic bomb tests at Bikini Atoll.

The research vessel *Atlantis* has carried out surveys designed to locate accurately the northern edge of the Gulf Stream. For the first time Loran was used as an aid in such oceanographic work. She has also occupied an extensive network of deep hydrographic stations in the roughly triangular area Cape Hatteras—Bermuda—Puerto Rico. Supported by a grant from the Geological Society of America a group working under the direction of Dr. W. M. Ewing occupied a number of seismic stations over the continental shelf between Delaware and Maine. The Institution's new research vessel *Balanus* was employed in this work during the whole of the summer of 1946.

DIVISION XXI

CHEMISTRY AND PHYSICS

PHYSICAL CHEMISTRY

By George M. Murphy
Associate Professor, Yale University

GENERAL

Research voluntarily withheld from publication during the war years for security reasons and that pursued during the course of government contracts are gradually appearing in the literature. Of most immediate interest to the physical chemist is much of the atomic bomb research; physical chemistry of protein solutions; many of the instruments and electronic techniques developed at The Radiation Laboratory, Massachusetts Institute of Technology. The importance of releasing promptly as much of this material as possible is generally recognized.

RADIOACTIVE ISOTOPES

The most significant single publication from the atomic bomb project since the Smyth report is a list of the nuclei formed during fission, together with their decay characteristics, fission yields, and chain relationships (*J. Am. Chem. Soc.*, Nov.). This paper includes information both from the scientific literature and from the project reports. It will serve as a valuable source of data for the 160 radioactive fission products now recognized.

Many such fission products will be useful for tracer studies or other researches. Chain reacting piles now in operation can also produce other radioactive species in quantities vastly greater than was possible by previous methods. These isotopes may be purchased from The Clinton Laboratories of the Monsanto Chemical Co., Oak Ridge, Tenn. Orders are considered by an advisory committee of scientists, and preference is given to research programs involving the fundamental sciences, for therapeutic purposes and for training and education. The greatest demand has been for C^{14} which is useful for tracer research in photosynthesis, metabolism, rubber chemistry, cancer research, and reaction rates. Interest has also been shown in radioactive iodine, phosphorus, and gold for experimental study of hyperthyroidism and in the treatment of leukemia.

RADIOCHEMISTRY

Having secured a supply of suitable isotope, the chemist will usually find it necessary to convert this material from its original form into new compounds before the chosen tracer experiment can be studied. This procedure will often be difficult not only because of the relatively small samples of isotope available and its radioactive disintegration but also because the required compounds may be a complex one and not easy to prepare. The latter difficulty will generally be great in biological or physiological studies. It is for these reasons that synthetic radiochemistry is of great importance.

When radioactive isotopes are created, as in the neutron irradiation of nitrogen compounds to form C^{14}, the new nucleus possesses considerable excess energy which can be used in effecting synthesis. This so-called

Szilard-Chalmers process has been studied at the University of California (Yankwich, Rollefson, and Norris) where it was shown that a variety of active carbon compounds can be so formed. The reaction products depend on the conditions of neutron irradiation, type of solvent, and other factors. The same idea has been used by Reid (Columbia University) to prepare radioactive amyl iodide by neutron irradiation of a pentane solution of iodine.

TRACER EXPERIMENT

A typical application of radioactive isotopes to a chemical problem was made by Bardeen, Brattain, and Shockley (Bell Telephone Laboratories). A thin layer of radioactive copper was electrolytically deposited on a copper surface. After oxidation had been secured, successive layers of the oxide were removed and analyzed for activity. The observed self-diffusion of copper is in agreement with a theory proposed by them and confirms a theory of oxidation suggested by Wagner in 1933. The same radioactive copper was used by Duffield and Calvin (University of California) to study the kinetics of exchange between copper acetate and chelate compounds in pyridine solution.

CHEMICAL EFFECTS OF RADIOACTIVITY

An interesting attack on the problem of petroleum genesis has been made at the Massachusetts Institute of Technology. Fatty acids and hydrocarbons have been bombarded with both deuterons and alpha particles. The decomposition products are complex but it could be shown theoretically that the energy absorbed is practically independent of charge, mass of bombarding particle and its velocity. Among the products were compounds identical with those naturally occurring in petroleum.

SEPARATION OF ISOTOPES

A comprehensive summary of the thermal diffusion method for isotope separation has been presented by Jones and Furry (Harvard University). An important feature of this paper is the design of two experimental units: one for concentrating C^{13} in methane; the other for He^3. The latter occurs in nature to the extent of only one part in 1-10 million of helium but it would be useful as a cyclotron particle, and its exact mass is of interest to the nuclear theorist. Experimental studies of the thermal diffusion method have been made at Yale University, both in confirming the theoretical predictions and in obtaining partial separation of the oxygen and chlorine isotopes.

Another method for separation of He^3 has been proposed by Franck (University of Chicago). The greater part of a sample of liquid helium in the superfluid state would be allowed to escape from a container; He^3 would remain in the residue. If successful, this experiment would also confirm some of the current theories of the superfluid state.

Separation of the potassium isotopes was achieved by electrolytic methods at the Georgia School of Technology and at the National Bureau of Standards. In the former case, aqueous solutions of potassium chloride were electrolyzed at a flowing mercury cathode; in the latter experiment, the net transport of potassium ion was kept at zero by flowing electrolyte and separation is said to occur because of differing ion mobilities of the isotopes.

The chemical exchange method, developed by Urey and his colleagues (Columbia University) has been adapted to the commercial production of C^{13} by the Eastman Kodak Co. The material is sold as potassium cyanide with excess isotope concentrations up to 26 per cent. The more concentrated samples are to be allocated for tracer use in research on cancer and metabolic diseases.

MOLECULAR SPECTROSCOPY

Two new techniques have been applied to the treatment of the complicated spectra obtained with polyatomic molecules. In one, proposed by Kron (General Electric Co.) a suitable electrical network is set up for the molecule. An alternating current network analyzer, numerical methods, or digital calculating machines are then used to obtain the frequencies, vibrational modes, and other characteristics of the molecule. Tests with molecules previously studied by other methods indicate that the network procedure may be useful and that it may minimize the laborious mathematical computations now required.

The second technique has been used by King, Cross, and Thomas (Arthur D. Little, Inc., Brown University and Massachusetts Institute of Technology). They have adapted standard punched card equipment to calculate the expected appearance of certain band spectra of hydrogen sulfide. The results are in good agreement with observation, and here also the methods will be valuable where other procedures might be prohibitively laborious.

Punched card techniques and electrical accounting machines have also been used by Pauling and his collaborators (California Institute of Technology) for crystal structure and electron diffraction calculations.

A modification of the usual group theory method, commonly used for the spectrum of gaseous molecules, has been proposed by Halford (Harvard University) for solids and liquids. Application of it to determine the expected spectrum of gaseous, liquid, and crystalline benzene shows it to be in agreement with observation. It is also concluded that all previous interpretations of these spectra must be revised in the case of benzene.

Molecular absorption in the microwave region, about one centimeter wave length, has been studied at several laboratories for ammonia, water vapor, and a few other molecules. Absorption in ammonia arises from the oscillatory motion of the nitrogen atom through a plane containing the three hydrogen atoms. Although this absorption was previously known, a hyperfine structure of about 30 lines has now been observed using the new techniques. Although not anticipated by theory, it has now been shown that the structure of the spectrum is caused by coupling of nuclear quadrupole moments. The observations are in striking agreement with the extended theory.

MOLECULAR BEAMS AND NUCLEAR INDUCTION

The molecular beam magnetic resonance method, developed by Rabi and his coworkers (Columbia University), has been reviewed by Kellogg and Millman (*Rev. Mod. Physics*, July, 1946). Originally designed for determination of nuclear magnetic moments, it has been adapted for measurements more directly concerned with physical chemistry. For example, Hughes (Socony Vacuum Laboratories) has shown how it may be used to obtain electric dipole moments and moments of inertia for diatomic molecules, and from the Columbia laboratory, measurements of nuclear quadrupole interactions in sodium halides have recently been reported.

A new magnetic phenomenon known as nuclear induction, has been studied by Purcell, Torrey, and coworkers (Radiation Laboratory, Massachusetts Institute of Technology and Harvard University) and by Bloch and coworkers (Stanford University). In these experiments, the material to be studied is placed in a constant magnetic field, at right angles to which there is a radiofrequency. A component of nuclear polarization at right angles to both fields can be observed owing to voltages which it induces.

This experiment was designed primarily for measurement of nuclear gyromagnetic moments but the effect depends also on relaxation times in a solid on liquid. Preliminary studies with water, ice and paraffin show that protons in the latter have much shorter relaxation times than either in liquid water or ice. This unexpected result may lead to important knowledge of the solid state. Other applications will certainly arise.

LOW TEMPERATURE STUDIES

The phenomenon of superconductivity, exhibited by certain solids at a few degrees above absolute zero, has also been reported by Ogg (Stanford University) to occur in metal-ammonia solutions at temperatures as high as 200° absolute. Dilute solutions of sodium in liquid ammonia are rapidly frozen. A large decrease in electrical resistance occurs; in one example, the resistances of the liquid at —33°C. was 10,000 ohms, that of the solid at —95°C. was only 16 ohms. Superconductivity was demonstrated by the classical Kammerlingh Onnes ring experiment in which annular disks of the frozen material, between the poles of an electromagnet, retained persistent currents after removal of the magnetic field. The experiment has been repeated at Oxford and Washington universities with confirmation of the effect in general but some disagreement as to details and interpretation.

The explanation offered by Ogg involves the supposition that electron pairs trapped at vacant negative ion sites in the crystal lattice are forced to obey Bose-Einstein statistics. Superconductivity occurs as a necessary consequence, according to current theories.

PROTEIN INVESTIGATIONS

For some years. Cohn in the Department of Physical Chemistry, Harvard Medical School and his coworkers have studied the physical chemistry of protein solutions. During the war years, these researches were aided by grants from The National Research Council and by government contracts. The substance most thoroughly investigated was human blood.

A series of reports currently appearing in the *Journal of The American Chemical Society* describes a system for separation of the protein and lipid components of blood into a number of fractions. The methods are said to be adaptable to other biological systems. Large quantities of the serum and plasma proteins, separated according to the Cohn methods, were made available for clinical use and are now licensed products.

Simultaneous controls of several variables during the fractionation process are required in order to obtain optimum conditions for the separation. Thus far, the more important ones have been salt, protein, water miscible organic precipitant, hydrogen ion concentration, and temperature.

From the same laboratory, Scatchard and his collaborators report on the osmotic pressure of serum albumin, which accounts for the efficacy of this material and plasma in the treatment of shock. Osmotic pressure relationships for systems of the sort considered were given by Donnan in 1911 but the results were applicable only to ideal solutions. These restrictions have now been removed by Scatchard. The theory was tested by determining the osmotic pressure and sodium chloride distribution across a membrane impermeable to albumin. The osmotic pressure was found to be a quadratic function of the concentration of the latter. The first term in this expression corresponds to a molecular weight of 69,000.

COLLOID AND HIGH POLYMER RESEARCH

Two new journals dealing with these subjects made their appearance in January 1946. One is called *The Journal of Polymer Science;* its editorial board has representatives from The American Chemical Society, The American Physical Society, and the Society of Rheology as well as foreign members. The other, *The Journal of Colloid Science,* also has an international editorial board with Victor K. LaMer, Columbia University as editor-in-chief. Both journals appear bimonthly. During 1946, about 100 papers were published in these two journals, and a considerable further number in these important fields were published in other American journals.

PHYSICS

By Thomas H. Osgood
Professor and Director, Division of Physical Science,
Michigan State College

GENERAL

Since there are over 300 journals in which accounts of worth-while research in physics are published, it is obviously impossible to do justice to the literature in a brief review. The selection of material is therefore a matter of individual choice, determined by the background and interests of the reviewer. The problem of recording and making available in libraries up to date information on research in all subjects becomes more pressing each year as the volume of publication increases. For more than three centuries, the great libraries have had to double their capacity every 16 years, but this can not go on much longer. Physicists are particularly interested in the development of new ways of storing information in small space, if only for the reason that it is from technical discoveries that these methods emerge. A discussion of some possible solutions of the problem has been given by D. Roller (*Amer. Jour. Physics,* 14, 300).

A goodly proportion of scientists, including some of those who aided in the development of atomic bombs, have been much concerned about the future use of atomic energy, and have been, for scientists, unusually emphatic in their writings and speeches. There is among competent men a clear realization (1) that the industrial use of nuclear energy is not to be achieved in the immediate future; (2) that for some years the vast range of new radioactive materials which can be produced in chain reacting piles will permit such advances in medical and biological science as to dwarf all other developments; and (3) that investigations into appropriate techniques for using nuclear energy are likely to be so costly that government must take a leading part in sponsoring such work. About these points there is widespread agreement. About the political and social consequences of the use of atomic energy there is great confusion and some apprehension among scientists and laymen alike.

World events of the years 1939-46 raised certain aspects of physics to such importance that the lack of trained personnel has become acute. Large research organizations controlled by some form of governmental authority, laboratories of industrial corporations, physics departments of universities, colleges, and high schools are all very short of capable physicists; and, of these, the ones which offer the smallest financial returns to the individual are the least well staffed. Educational institutions happen to occupy this unfortunate position at the moment, with the result that the training of adequate numbers of high caliber physicists will be delayed at a time when their services are most in demand.

There have been or are being established for the development of radioactivity and nuclear physics in the United States four National Laboratories whose work must be segregated and partially protected by security regulations because of the difficult and costly and, in untrained hands, dangerous nature of the operations they conduct. They are a natural outgrowth of wartime work on fission. In spite of their generous and widely publicized arrangements for cooperation with nearby institutions of higher learning, it is probable that many universities will not be able at once to avail themselves fully of the opportunities for cooperation, partly on account of the expense involved in equipping new laboratories, and partly on account of the heavy teaching duties which have fallen upon faculties.

NEUTRONS

Since the construction of the atomic bomb depended to a large extent on knowledge of the properties of neutrons, the publication of papers dealing with the behavior of neutrons was officially discouraged during the years 1940-46 in all countries where programs for the development of nuclear energy were under way. In several numbers of *The Physical Review* issued during 1946 are many original papers dated 1941 and 1942 which were "voluntarily withheld from publication until the end of the war." These papers represent researches of scientists, who, in those early war years, were not yet connected with government scientific agencies, and were therefore not yet bound by security restrictions. During 1946, also, there was a declassification—a word which represents the removal of an official veto on free publication—of many items of research concerning neutrons. This process has added something of the pre-war sparkle to meetings of professional physicists, but it has also given an inkling of how much scientific information still remains on the secret list, and of which the majority of physicists must remain in ignorance for some time.

The neutron is an uncharged particle of about the same mass as the proton. Since Chadwick's discovery of the neutron in 1932, its mass has been re-determined with gradually increasing precision. Measuring the mass of the neutron is not a simple weighing operation but is a process involving a consideration of the energy exchanges in a series of chosen nuclear reactions, and a rigorous application of Einstein's principle of the equivalence of mass and energy. The most acceptable mass changes slightly from time to time, according to scientific opinion concerning the trustworthiness of the experimental data from which the mass is deduced. For example, Kuan-Han Sun (*Physical Rev.* 69, 240), writing from New York in February, 1946, gave the mass as 1.00892 ± 0.00004 on the scale $0^{16} = 16.0000$. In July, Donald J. Hughes (*Physical Rev.* 70, 219) of the Argonne National Laboratory, improved this value to 1.008937 ± 0.0000075. These two reports illustrate the frequent changes which occur in the accepted values of the fundamental constants, and the gradual increase in precision which marks a series of re-evaluations.

The extent to which a layer of atoms obstructs the passage of a stream of neutrons depends markedly on the velocities of the neutrons. (In the same way, the number of collisions made by a man moving through a crowd depends on whether he walks or tries to run.) Since neutrons of different velocities cause transmutation in varying degrees, it is important to know what are the velocities of neutrons emerging from a typical laboratory source. The method used by J. H. Manley, J. A. Haworth and E. A. Luebke (*Physical Rev.* 69, 405) of the University of Illinois was simple. Suppose that a crowd of boys ran a 100-yard race, all starting together, and that the winner took 15 seconds. If a record were made of the number finishing during the 16th second, and during the 17th second, and so on, it would be possible to tell how fast the boys ran, and what proportion of them ran at a certain speed. Replace the boys, all starting together, by a burst of neutrons; think in terms of millionths rather than of whole seconds, and imagine the timing controlled electronically; then the descriptions of the boys' race and the neutrons' race become identical. The three authors, using neutrons issuing through a 14 cm. cube of paraffin, found that the distribution of velocities was Maxwellian, that is, like that of the molecules of a gas at ordinary temperatures, up to velocities of 3·5 km/sec, with an excess above the Maxwellian distribution for higher neutron velocities. To put it another way, 14 cm. of paraffin was enough to bring to thermal equilibrium all neutrons below 3·5 km/sec, but not above that velocity.

Other experiments with neutrons were devised to determine how much they were scattered by certain elements; how readily they were absorbed by others; how many nuclear fragments were ejected as a consequence of transmutation; in what directions the nuclear fragments were ejected, and what proportion at each angle; and at what particular neutron velocities nuclear disintegrations were most likely to occur. Meanwhile theoretical physicists were busy synthesizing the data into consistent theories from which new results could be predicted, as for example G. Placzek's article (*Physical Rev.* 69, 423) on the slowing down of neutrons in heavy substances, and E. Wigner's more general treatment of the problem of resonance reactions and anomalous scattering (*Physical Rev.* 70, 15).

Perhaps one of the most spectacular reports was that by W. H. Zinn and others (*Physical Rev.* 70, 102) describing the reflection of neutrons from crystal faces. A chain reacting pile, developed at the University of Chicago Metallurgical Laboratory in 1942, can produce a stream of neutrons thousands of times as intense as that available from any pre-war source. A narrow beam of these was selected by slits placed a few meters apart, and the beam was allowed to fall on the face of a crystal, following the scheme used in an x-ray spectrometer. Some of the neutrons were reflected at each of several different angles, and in this way a spectrum of the neutrons was obtained. This represented an advance in experimental technique rather than in theory, for L. de Broglie predicted in 1925 that every moving particle should possess a characteristic wavelength, so that moving particles such as neutrons would have some of the wave properties of x-rays. The relation $\lambda = h/mv$ giving the wavelength in terms of Planck's constant, and its velocity the mass of the particle of action, was amply verified by Davisson and Germer in 1927 for electrons, and formed the basis of these new experiments with neutrons. W. H. Zinn, along with E. Fermi (*Physical Rev.* 70, 103) also showed that neutrons, again like x-rays, could be reflected at very small angles from polished surfaces of graphite, glass, aluminum, beryllium, copper, zinc, nickel, and iron.

As soon as any experimental tool reaches the state of development of modern neutron beams, it is of the greatest importance to have standards of intensity to go by. Recognizing this, G. R. Gamertsfelder and M. Goldhaber (*Physical Rev.* 69, 368) have developed a standard neutron source which they call a "reproducible neutron standard" in which the intensity of emission can be varied by the experimenter over a range of about five times. Such a source has an important part in all nuclear measurements.

ACCELERATING MACHINES

The details of the structure of the complex nucleus are not well understood. The puzzling forces which hold protons and neutrons together are believed to be governed in part by the meson, a particle, positively or negatively charged, possessing a mass intermediate between that of a proton and an electron. It is to expedite the solution of nuclear problems that engineer-physicists are continually devising new machines to accelerate atomic projectiles to higher and higher energies. The machine-of-the-year is the synchrotron, with which optimists hope ultimately to produce particles with energies in the billion volt range, or nearly ten times as great as can be achieved directly by the great University of California cyclotron. By the end of 1946, however, no synchrotron was yet in operating condition, but the necessary mathematical theory was well worked out. Late in 1946, a machine of this type, designed for 300,000,000 electron volts, was under construction in California, and similar but not identical machines were being developed elsewhere in the United States and in Russia.

V. Veksler (*Jour. Physics U.S.S.R.* 9, 153) and E. M. McMillan (*Physical Rev.* 68, 143) were independently responsible for the basic idea of the synchrotron. A clear exposition of its principle appeared in a theoretical paper by D. Bohm and L. Foldy (*Physical Rev.* 70, 249) from which the following account is taken. It should be noted first that in a conventional cyclotron the frequency of the accelerating field is chosen to match the angular velocity of the ions, but as relativistic effects increase the masses of the ions they fall out of phase and are accelerated no more. In the cyclotron, the angular velocity, ω, of a particle of charge e and mass m, in a magnetic field H is given by $\omega = (ecH)/E$ where E is the total energy. Thus ω decreases as the energy increases. Suppose now that the instantaneous value of ω exactly matches the frequency of the accelerating field and that the ions are only a little late in crossing from one D to the other, so that the energy of the ions is still being increased. Then, ω will begin to decrease, and the ions will run later and later until they actually begin to lose energy by crossing the gap at the wrong phase. This will continue until the ions slow down to their original energy. The energy will then overshoot this value somewhat with ω increasing, until the ions are again in such phase relation to the applied field that they are accelerated in crossing the gap between the D's and the whole cycle is repeated. Thus the time of gap crossing and the energy undergo stable oscillations, and the ions stay very near a stable orbit.

If now the magnetic field H is increased a little, the angular velocity, by the equation above, will be too great for the instantaneous value of E. The ions begin to get across the gap a little earlier, increasing the value of E, until a new stable orbit is reached. Successive small increases in H will cause corresponding increases in E. Therefore, once a cyclotron is operating under stable orbit conditions, further acceleration of the ions can be accomplished by increasing the magnetic field slowly. Alternatively, the frequency of the accelerating voltage applied to the D's may be varied with a like result. It is essential, however, in either case, to make the variation slow, so that orbit stability may be preserved at all times. A machine utilizing either of these methods of acceleration is termed a synchrotron.

The most energetic particles yet created artificially are electrons from the General Electric Company's 100,000,000 electron-volt betatron. With x-rays produced by those electrons, some interesting effects have been reported by Marcel Schein, A. J. Hartzler, and G. S. Klaiber (*Physical Rev.* 70, 435). Using a cloud chamber of conventional size in a magnetic field, they have photographed a few, but only a few, particles heavier than positive or negative electrons, ejected by the x-rays. As explained below, the identification of ionizing particles by their tracks in a cloud chamber is a very uncertain matter, unless the tracks are abundant. The available evidence suggests that the heavy particles photographed to date in this experiment are mesons. Their masses can not be determined accurately, but a mass 200 times the electron's mass is not inconsistent with the observations.

COSMIC RAYS

Mesons are charged particles which may or may not always be born from disrupting atomic nuclei, and which have only a brief existence of one or two millionths of a second before they themselves disintegrate into electrons and neutrinos. The focus of interest in the field of cosmic rays is the question of the properties of the meson, and for this reason investigations on cosmic rays are an important part of nuclear research. Mesons and other particles are found in cosmic rays with energies of billions of electron volts; but they come at random times and places. These fast particles cause nuclear disintegrations, and it is in order to duplicate their effects under controlled laboratory conditions that physicists are so eager to construct powerful accelerating machines. Experiments now to be described, from a 1946 paper by Donald J. Hughes (*Physical*

Rev. 69, 371), may be taken as typical of current work on cosmic rays, although the experiments were actually performed in 1941 in Peru, during the University of Chicago's South American cosmic ray expedition.

At an altitude of 15,500 ft., 5,000 photographs of charged cosmic ray particles were taken with a Wilson cloud chamber. This instrument, when properly controlled and illuminated, shows a line of tiny water droplets along the paths traveled by the particles. The drops persist long enough to be photographed. If a uniform magnetic field is maintained in the chamber, the charged particles are constrained to move in slightly curved paths, whose radii are an important factor in analyzing the observations. Hughes' problem was concerned with measuring the proportions of different kinds of particles, their masses, and their velocities, with special emphasis on slow mesons. The vagueness of the word 'slow' is indicative of the uncertainty attached to such cosmic ray experiments. It is customary to call a particle *fast* when it exhibits no measurable curvature in a field of about 1,000 gauss, and is consequently traveling at nearly the speed of light; and *slow* when the curvature is definite, and the particle has energy not greater than a few million electron volts.

There are two ways of determining the nature and velocity of a particle in a cloud chamber. A fast lightweight particle leaves behind it a trail of very sparsely distributed water droplets; on the other hand, a slow massive particle makes a broad track, so thickly populated with water droplets that they can not be distinguished separately. Between these two extremes all kinds of gradations may appear. Since both mass and velocity separately affect the droplet density, it is usually necessary to appeal to other evidence to make a reliable identification of mass and velocity. This can be done in most cases. When this analysis fails, as it does for very fast particles, there is an alternative method. As a particle ploughs its way through the gas of the cloud chamber, it occasionally makes a close collision with an electron of the gas, driving it forward or at an angle to the main track. When this angle is measurable, it is usually possible to apply the laws of conservation of energy and momentum, and deduce the velocity of the primary particle.

Hughes used both these methods in his study of slow mesons at 15,500 ft. Perhaps the most important results of his experiments were (1) that mesons occur with a considerable range of masses, from about 25 to 200 electron masses, and (2) that the number of slow mesons observed increases rapidly with altitude, a fact which strengthens the supposition that they are born as such in the very high atmosphere from some other form of primary cosmic ray.

Another experiment of very topical interest was carried out by S. E. Goliar, E. H. Krause, and G. J. Perlow (*Physical Rev.* 70, 223). During the tests of captured German V-2 rockets at White Sands, New Mexico, the warhead of one of them was filled, not with explosive or equivalent inert matter, but with cosmic ray apparatus which transmitted by radio to scientists on the ground a great many simultaneous observations of the intensities of cosmic rays under different conditions of lead shielding. Satisfactory records, obtained between 40 and 70 miles altitude, indicated that, as expected, cosmic rays are much more intense in the fringes of the atmosphere than at ground level. Showers, for example, increased a few hundred-fold, and penetrating particles more than twenty-fold. Further tests will be needed to verify these figures and to correlate them with other observations.

It is perhaps appropriate to mention one topic related to cosmic rays because it has a bearing on current events and may therefore have a special appeal to the layman. The question is often asked, What are the radioactive effects of atomic bombs at places far distant from the explosion? Two notes by A. W. Coven (*Physical Rev.* 68, 279) and by G.

Herzog (*Physical Rev.* 70, 227) provide a rough answer. They measured the "background count" of radioactivity (including cosmic rays) in the atmosphere at ground level immediately before and after any change occurred which might have been due to a distant atomic bomb explosion. Any unexpected increase might be due to radioactive effects of the atomic bomb. Both observers reported a temporary increase, for a matter of some hours, amounting to about 75 per cent. The validity of these results is made doubtful by records of three other similar tests published in October, 1946, in no one of which was there any definite indication of a significant increase in atmospheric radioactivity due to the explosion of an atomic bomb several thousand miles away. In any case, since the normal background count is far, far below any danger level, apprehension on this score will be unfounded until the world becomes fairly thickly populated with atomic power plants.

SUPERCONDUCTIVITY

When a piece of lead, which ordinarily has a comparatively high electrical resistance, is cooled in liquid helium, a few degrees above absolute zero, its resistance diminishes to practically nothing. Such an occurrence is an illustration of superconductivity, a phenomenon whose details are not yet well understood. Much importance has been attached to a study of the effect, for it may provide a clue to some difficult points in theories of the structure of metals and of liquids. Liquid helium itself does not become superconducting even below 2° absolute, but it displays other remarkable properties, such as an almost negligible viscosity, and an incredible ability to creep over solid surfaces, which set it apart as a unique fluid.

Richard A. Ogg Jr. of Stanford University caused a flurry of interest when he announced (*Jour. Chem. Physics* 13, 533) in 1945 that comparatively weak frozen solutions of metallic sodium in ammonia showed superconducting behavior even at temperatures about 200 degrees above absolute zero. He made direct measurements of the conductivity of the frozen solutions at the temperature of liquid oxygen (−180°C), finding that the resistance was between 10 and 50 ohms, whereas at temperatures above the melting point the resistance was 1,000 times as great. Experiments were also performed in which a small ring of a solution between glass plates was frozen in liquid oxygen in a magnetic field. Upon quick removal of the specimen from the field, magnetic induction set up a circulating electric current which was detectable by a small search coil and ballistic galvanometer. Currents were found to persist for a minute or two in favorable cases. Such a long persistence of current indicated a resistance of the order of one millionth of one millionth of 1 ohm.

The experiments have been repeated by H. A. Boorse, D. B. Cook, R. B. Pontius, and M. W. Zemansky (*Physical Rev.* 70, 219) of Columbia University, both following Ogg's directions and following slight modifications of his procedure. In no case were they able to detect any superconducting properties of the sodium-in-liquid-ammonia solutions. In Oxford, J. G. Daunt, M. Désirant, K. Mendelssohn and A. J. Birch, long experienced in work on superconductivity, found (*Nature,* 157, 839) that the resistance of such solutions drops very appreciably on freezing, but they stated that the residual resistance was actually a property of the frozen solution and was not, as Ogg thought, due to poor contact at the electrodes, or to cracks in the frozen solid. The English physicists could not duplicate the Californian's results on persistent currents, and therefore could not agree that the frozen solutions were in a true superconducting state. Then J. W. Hodgkins of Ottawa (*Physical Rev.* 70, 568) described a series of experiments which gave strong support to Ogg's original results. Hodgkins found persistent currents in only a few per cent of the total number of trials, and believed, as Ogg did, that the low incidence of successful experiments was due to severe cracking of the samples on freezing. There the matter rested at the end of 1946, awaiting clarification by further investigations.

Daunt and Mendelssohn have also done a clever experiment to elucidate the properties of liquid helium II, as that liquid is called when its temperature is below the λ-point, which is 2.19° above absolute zero. The point at issue was this. It has generally been supposed that the frictionless transport of helium II required gravitational potential energy. However, the two Oxford men proved that such a transport takes place without a difference in gravitational potential energy; in other words, helium II can flow over a barrier from one vessel to another, even if both vessels contain liquid at the same level. This behavior is analogous to the flow of electric current under zero difference of potential, which is one way of describing superconductivity. Thus there is an experimental similarity between the two phenomena, and it is usually explained by presuming that the helium atoms, as well as the current-carrying electrons, have special properties with respect to energy, which are theoretically associated only with the absolute zero of temperature, but in these cases manifest themselves at a slightly higher temperature. It will be interesting now, as Daunt and Mendelssohn point out, to look for isothermal heat flow and persistent mass circulation in helium II.

NOBEL PRIZE

The Nobel Prize in physics was awarded in 1946 to Prof. P. W. Bridgman of Harvard University, famed for his experiments on matter under extremely high pressures (THE AMERICAN YEAR BOOK, 1938, p. 721) and for his writings on the philosophy of science.

ORGANIC AND INORGANIC CHEMISTRY

By C. M. SUTER

ASSOCIATE DIRECTOR OF RESEARCH, STERLING-WINTHROP RESEARCH INSTITUTE

GENERAL

The volume of published material dealing with research work carried out during the war years was at its peak during 1946. Almost every journal contained papers of the "Now It Can Be Told" type and in several instances one or more whole issues of a particular journal were devoted to reports of war-inspired research. For example, the July and August issues of the *Journal of the American Chemical Society* were largely filled with papers dealing with the synthesis of antimalarials carried out during the war. This was also true for the *Journal of Organic Chemistry*. Work on antimalarial syntheses ranked high in terms of laboratory work expended from the organic chemical standpoint.

At the Chicago meeting of the American Chemical Society, a symposium on fluorine chemistry lasted for several days. The very extensive series of investigations described originated because of the need for certain new fluorine compounds in the Manhattan project.

The details of yet another study, the work on the synthesis of penicillin, have not yet appeared since it was considered that it would be best to publish this in a monograph form rather than flooding the appropriate journals with the work.

PUBLICATIONS

The problem of properly abstracting and summarizing the vast amount of published material in the various fields of science grows with the years. With the disorganization of German science and its publications, the future of Beilstein's *Handbuch* and the *Chemische Zentrallblatt* became uncertain. Steps have been taken to improve and expand *Chemical Abstracts* published by the American Chemical Society to compensate for some of these losses.

With the publication of many reports on German research and technology under the auspices of the Publication Board, later changed to Office of Technical Services in the Department of Commerce, the need arose for a method of informing technical men what material was available. Starting early in 1946, the Department of Commerce published an abstract journal giving classified abstracts of material obtained from enemy countries and also recording abstracts of newly released data from war research done in this country. The material described in this new journal is for the most part not covered in *Chemical Abstracts,* hence any search of the literature must now include the new publication if it needs to be complete.

RADIO CHEMISTRY

The work of a scientific nature resulting from the Plutonium Project division of the Manhattan Project is to be described in a series of volumes known as the "Plutonium Project Record of the Manhattan Project Technical Series." The two volumes of interest to chemists will be 9A entitled *Radiochemistry and the Fission Products* and 9B, *Collected Papers on Radiochemistry and the Fission Products.* These are expected to appear during 1947. In the meantime there has appeared a concise review in tabular form of the 160 radioactive fission products now recognized as resulting from the operation of the uranium pile. The information needed to make a report of this kind required an enormous amount of chemical and physical investigation of the nature of the new nuclei and represents a great increase in the knowledge of isotopes of the various elements.

FLUORINE CHEMISTRY

Since fluorine chemistry in the past has been a relatively small fraction of chemical industry much work was necessary before suitable industrial methods for the preparation of fluorine and fluorinated organic compounds could be prepared on a large scale. Several practical fluorine cells, suitable for the preparation of fluorine on a considerable scale, have now been described. The capacity of these ranges as high as 2,000 amperes. The electrolytes in these cells are $KF \cdot HF$ (KHF_2). Satisfactory cells were developed by the cooperative effort of many investigators in several laboratories, including those of the Harshaw Chemical Co., Massachusetts Institute of Technology, Johns Hopkins University, E. I. du Pont de Nemours and Co. and the Hooker Electrochemical Co. In addition, the handling of fluorine on a laboratory scale was worked out in detail in the research laboratories of the Pennsylvania Salt Co.

The handling of fluorine presented many problems, including suitable containers and methods for compressing this highly active element. In brief, these problems were solved satisfactorilly, and fluorine can be handled in cylinders under pressure.

Much of the work using elementary fluorine was concerned with the production of fluorocarbons, compounds in which the hydrogens of ordinary hydrocarbons such as those obtained from petroleum, are completely replaced by fluorine. In the extensive series of studies carried out compounds having as many as 21 carbon and 44 fluorine atoms were prepared. The fluorination process is a catalytic one usually not involving elementary fluorine directly since this is too reactive, but a less active fluorinating agent. Such agents were discovered in the fluorides of certain metals in a high state of oxidation. Chief among these are cobalt trifluoride, manganese trifluoride and silver difluoride. In general hydrocarbon vapors were brought into contact with these fluorides at a fairly high temperature. The yields were quite good, varying up to 95 per cent depending on the hydrocarbon used.

In an alternative process it was found possible to fluorinate hydrocarbons with elementary fluorine provided the reacting gases were diluted with nitrogen and mixed gradually in the presence of the catalyst which consisted of a thin layer of silver fluorides on a copper base. The fluorocarbons made were not limited to aliphatic compounds but included many cyclic derivatives of both aromatic and naphthenic structure.

The workers involved in this field of research were very numerous and were located at a number of universities and industrial laboratories. These include Duke University, Columbia University, Johns Hopkins University, Purdue University, SAM laboratories, the du Pont Co., and the Hooker Electrochemical Co.

In addition to the fluorocarbons, other polyfluorinated products were obtained. These include perfluoroadipic acid. From this it was possible to obtain a series of compounds including octafluoro-1,6-hexanediamine which is a highly fluorinated analog of the amine used in the preparation of Nylon.

Another very interesting compound prepared was tetrafluoroethylene. This fluorocarbon is a highly reactive gaseous compound which boils at —76°C at atmospheric pressure. Upon polymerization it yields a solid product having most unusual properties for a resinous product, one of which is stability to heat, a temperature of 400-500° being necessary to bring about decomposition. It is to be expected that this polymer will develop a number of specialized uses and become an important member of this growing family of substances.

Perfluorobutadiene was also prepared. In contrast to the corresponding chlorine compound, this product is highly reactive and can be polymerized; the polymerization can be controlled to yield a dimer and trimer or can be carried further to give a thermoplastic high polymer.

ANTIMALARIALS

Although the synthetic antimalarial quinacrine (Atabrine [Registered trade mark of Winthrop Chemical Co.], mepacrine, Atebrin) proved of inestimable value in protecting the United States armed forces in widely scattered malarious areas, it is characterized by deficiencies which indicated the need for a better drug. Hence a comprehensive research program was organized under the auspices of the Committee on Medical Research of the National Research Council and financed by the Office of Scientific Research and Development. In addition, several large pharmaceutical houses and chemical companies took part in the program without being reimbursed by the Government for their expenses. The contribution made to this program by the organic chemists was the synthesis of many thousands of compounds, a large percentage of which were new, and the development of manufacturing methods for compounds which gave sufficient promise in the preliminary testing so that larger amounts were needed for clinical trial.

In as much as the most active antimalarial drugs known at the start of the program were quinoline and acridine derivatives, many additional representatives of these groups of compounds were synthesized. Apparently none of the new acridine derivatives, which were mostly analogs and homologs of quinacrine, showed any significant advantage over this compound. Among the quinoline compounds submitted, however, a number showed considerable promise. One of these, 7 - chloro - 4 - [4 - (diethylamino) - 1 - methylbutylamino] quinoline known commonly as SN-7618 and chloroquine, was tested on a large scale and found to be superior to quinacrine on several counts. During the year its commercial manufacture and distribution were started. It is colorless, avoiding the yellow skin coloration which occurs with quinacrine, and its action as a suppressive among those frequently exposed to infection may be maintained by weekly doses rather than the daily dosage required with quinine or quinacrine. Like quinacrine, however, relapses may occur in cases of vivax malaria.

Another compound, an 8-aminoquinoline derivative (SN-13,276) which is a variant on pamaquin (Plasmochin) shows promise of use in curing relapsing malaria when taken in combination with quinine. However, clinical testing is still under way. One of the most interesting chemical developments coming out of this program was the elaboration of several new methods for the synthesis of quinoline derivatives by Price and coworkers (University of Illinois). The important observation in this work was that ring closure of a 3-substituted phenylaminomethylenemalonic ester gave almost entirely (over 95 per cent) the 7-substituted quinoline whereas previous quinoline syntheses afford a mixture of 5- and 7-substituted quinolines under these circumstances.

In addition to the quinolines and acridines many other groups of compounds were synthesized and found to have anti-malarial activity. Altogether some 60 chemical classes gave positive tests in bird malaria. The more important classes include a group of new sulfa drugs, naphthoquinone derivatives and mannich bases derived from phenols. This work was summarized by Dr. C. S. Marvel (University of Illinois) and Dr. Robert C. Elderfield (Columbia University) at the comprehensive symposium on antimalarials held under the auspices of the Medicinal Chemistry Division of the American Chemical Society at its Atlantic City meeting April 8-12, 1946.

Shortly after the termination of active fighting in Germany, German research laboratories were visited under the auspices of the Technical Industrial Intelligence Committee (T.I.I.C.) to discover what unpublished research on antimalarials might be found. Nothing more beyond further studies in the 4-aminoquinoline series came to light. Reports on these visits are available from the Office of Technical Services, Department of Commerce, Washington, D. C.

PENICILLIN

In one of the first attempts to synthesize penicillin made by Folkers and coworkers (Merck & Co.) the reaction product was found to possess definite activity in the usual agar plate test. The activity was so small, however, that not more than 0.1 per cent of pure compound could have been present. At the time, this result was not taken very seriously because many compounds show a slight antibacterial action, and to isolate the component of the mixture responsible did not seem worth while. Later when all other methods of synthesis had failed du Vigneaud (Cornell University Medical School) returned to the task of determining whether the activity was caused by traces of penicillin or by some other impurity. When partial purification had been accomplished, strong evidence was obtained that benzylpenicillin (Penicillin G) was actually present both by biological testing and by the use of radioactive sulfur in the synthesis. With this encouragement and the use of counter-current fractionation techniques it was finally possible to isolate a few milligrams of authentic penicillin. Unfortunately the process is so expensive that it can in no sense compete with the natural product. Furthermore, because the yield is so low, the method does not throw any light upon the structure of penicillin, which is not yet completely determined.

The publication of a description of the isolation of benzylpenicillin was unexpected because publication of chemical work in this field has in general been in abeyance pending appearance of the monograph covering the cooperative work done both in this country and Great Britain in many laboratories on penicillin synthesis during the war period.

The attainment of the penicillin synthesis should make it possible to prepare a number of new compounds in this series, although at too high a cost for them to be useful in medicine. Already a variety of penicillins has been made by biological methods. Some of these are more active than benzylpenicillin, but apparently none has yet been found to be more useful therapeutically.

STREPTOMYCIN CHEMISTRY

Intensive work on the degradation and structure determination of streptomycin is under way in several laboratories because of the therapeutic possibilities of this antibiotic. Hydrolysis in acid solution yields a basic product streptidine, $C_8H_{18}N_6O_4$. Perhaps the simplest method for obtaining this is to isolate it as the crystalline sulfate. The ease with which the hydrolysis occurs is compatible with the idea that streptomycin is a combination of streptidine with streptobiosamine by a glycosidic linkage. Streptidine has little or no antibacterial action.

Another degradation product obtained from streptomycin is N-methyl-l-glucosamine. It was identified by showing its identity with N-methyl-d-glucosamine except for the sign of optical rotation.

A detailed examination of the behavior of streptidine established it to be one of the isomeric 1,3-diguanido-2,4,5,6-tetrahydroxycyclohexanes, or a relative of inositol, which is one of the members of the B vitamins complex. The structure was determined finally by conversion to a derivative of 2,4-diaminophenol which shows the position of the nitrogen linkages to the ring system.

Extensive work on the degradation products of streptomycin now clearly establishes its empirical formula as $C_{21}H_{39}N_7O_{12}$, and $C_{21}H_{41}N_7O_{12}$ for a reduction product, dihydrostreptomycin. It seems probable that the complete structure of streptomycin will be announced shortly, as the nature of the three units is now clear. It consists of the streptidine already mentioned which is linked through a glycosidic linkage with a disaccharide, the latter having one methylamino group. One can only comment on the remarkable diversity of structure exhibited by the naturally occurring antibacterial agents thus far studied.

CHEMISTRY OF MUSTARD GAS AND OTHER VESICANTS

In order to have a better understanding of the physiological properties, including the vesican action, of mustard gas, bis-(β-chloroethyl) sulfide, the fundamental chemical properties of this compound were subjected to an intensive investigation in several laboratories during the war.

It was found by Stein, Moore, Fruton, and Bergmann (Rockefeller Institute for Medical Research) that in the hydrolysis of mustard gas in aqueous solution one of the products is a sulfonium chloride which is even more toxic than mustard gas itself. This may be partly responsible for the physiological activity of the mustard. Mustard also forms a sulfonium compound by reacting with the sulfide group of methionine. In addition, it reacts with fatty acids in neutral solution and with amino groups. Since the compounds present in living cells include these various reactants, it is evident that the vesicant action may result from a variety of chemical changes. Although the sulfone obtained by the oxidation of mustard is vesicant in its action, it does not seem likely that the sulfone is formed *in vivo* and hence does not contribute to the toxic action of mustard.

During the First World War the Levinstein process for making mustard gas came into prominence. The reaction involved is the one between ethylene and sulfur monochloride. This was studied again in a comprehensive manner by Fuson, Price, and coworkers at the University of Illinois during the recent conflict, who were able to prepare and isolate for the first term the previously postulated intermediate, 2-chloroethylsulfenyl chloride. It was found that this sulfenyl chloride reacts rapidly with ethylene to yield mustard gas. Other olefins also react readily so that a number of homologs of mustard were made. The corresponding 2-chlorosulfenyl bromide was also prepared and converted into a bromine analog of mustard.

Levinstein mustard gas contains polysulfides as well as the normal monosulfide. In one part of the new investigation it was found possible to prepare a pure trisulfide. In addition a new polysulfide obtaining some 11 atoms of sulfur was isolated. The technical mustard gas contains about 30 per cent of a mixture of polysulfides. Of this mixture, the pentasulfide breaks down on heating to yield the trisulfide and a mixture of higher sulfides. The trisulfide is readily cleaved by chlorine to yield 2-chloroethylsulfenyl chloride and the chloroethyl dithiochloride which then undergoes further reaction. As a consequence of these results and others obtained during the course of the investigation, the various steps that occur in the Levinstein process became at last well understood. The fundamental studies carried out on the formation and reactions of mustard are of considerable general interest since the chemistry of polysulfides has been relatively obscure.

Several years before the recent conflict a new class of vesicants, the so-called nitrogen mustards, were discovered and received some attention. These have now been studied more intensively and a series of publications has resulted by Bergmann, Fruton, Golumbic, Stein, Stahmann, and coworkers of the Rockefeller Institute. In this group of compounds the chlorine atoms are separated from the nitrogen by two carbon atoms just as they are from sulfur in the older type of mustard. When a nitrogen mustard undergoes hydrolysis in slightly alkaline solution it is first converted into a cyclic immonium ion which is quit reactive chemically and physiologically. Some members of this group of nitrogen mustards may have valuable properties in treatment of disease since their activity tends to localize in growing cells including those characteristic of certain types of cancer. Some peacetime benefit may then result from this fundamental work on war materials.

WILLGERODT REACTION

The name of Willgerodt has long been associated with a transformation which results when an alkyl aryl ketone is heated to a high temperature in an aqueous solution of ammonium polysulfide. The resulting mixture contains an acid and an amide having the same number of carbon atoms as the original ketone.

Recently there has been a marked revival of interest in several laboratories in this reaction; as a consequence it is likely to become of practical value in the synthesis of a variety of organic amides, thioamides, and acids. The most important advance was the observation that not only ketones but also olefins, mercaptans, and other types of organic compounds can be utilized in one or another modification of the reaction. Thus the olefin styrene which is readily available at a moderate price, because of its wide use in synthetic rubber and resins, reacts with sulfur and morpholine (a nitrogen base) to give a thiomorpholide which is reported to have value as an insecticide. Similarly, olefins derived from petroleum may be converted into amides and acids which may be useful industrially. As has frequently happened in the past, what began as a fundamental study of an organic chemical reaction may enlarge the number of products available for industrial use.

ANTI-ANEMIA FACTOR

Several compounds have been isolated which possess blood-forming activity for animals and are also necessary for the growth of *Lactobacillus casei.* The structure of one of these substances, the so-called *liver L. casei* factor, has now been determined and the structure verified by synthesis. The molecule contains a glutamic acid residue, a p-aminobenzoic acid residue and a substituted pteridine nucleus. The chemical name is N- 4-(2-amino-4-hydroxy-6-pteridyl) methylaminobenzoylglutamic acid. One method of synthesis started with equimolecular quantities of 2,4,5-triamino-6-hydroxypyrimidine,p-aminobenzoyl-l-( )-glutamic acid and 2,3-dibromopropionaldehyde which gave a product containing 15% of the desired compound; the name pteroylglutamic acid was suggested for this new principle.

The isolation and synthesis of the *liver L. casei* factor has advanced another step the scientific understanding of the mechanism by which blood formation occurs. The work was carried out by a large group of scientists in the Lederle Laboratories and in the research laboratory of the Calco Chemical Division of the American Cyanamid Co.

SILICONES

The development of a new group of interesting compounds containing silicon was mentioned in 1945. During 1946 much of the scientific background responsible for these new organo-silicon compounds was published in the scientific journals and also well summarized in a monograph by Eugene G. Rochow (General Electric Co.) entitled, "Introduction to the Chemistry of the Silicones." The properties of the silicone polymers adapt various members of the group to a diversity of uses including the formation of water-repellent films, their use as lubricants and brake fluids and as resinous and rubber-like products. The members of the methyl silicone series, for example, exhibit an unusually small change of viscosity with temperature; they are chemically inert, are liquid over a wide range of temperatures and have a low freezing point. A trace of a silicone greatly reduces the foaming tendency of a lubricating oil. Some silicones may find use as dielectric media for transformers and other electrical equipment. In as much as a variety of application has developed from the moderate amount of research work expended on the silicone polymers thus far, many more industrial applications may be expected as this field is exploited.

SUGAR RESEARCH

Although it has been known for over 50 years that cane juice contains 1 per cent or more of reducing sugars in addition to the sucrose present, no one has been able to demonstrate the nature of these other carbohydrates until this past year. Binkley and Wolfrom (Ohio State University) have shown that Louisiana cane juice contains D-glucose (dextrose) and D-fructose (levulose) in addition to ordinary cane sugar. The chromatographic technique applied in this work may well be of importance in examining the composition of other sugar mixtures which are inherently very difficult to separate by methods previously available.

The gummy material exuded by the mesquite tree is primarily carbohydrate in character. Upon hydrolysis it yields two simple sugars, L-arabinose and D-galactose, and a glucuronic acid. Further studies of mesquite gum by White (University of Idaho) throw further light on the structure of the molecule; the ratio of arabinose to galactose to glucuronic acid was found to be 4:2:1 and it was concluded that an arabinose unit occupies a position at one end of the polymer chain, and the glucuronic acid unit is at the other. The exact manner in which the three building units are linked together is not yet clear but it seems certain that the carbohydrate chain is branched, the side chains being attached through the galactose units.

INSECT REPELLENTS

An important aspect of the protection of members of the armed forces against tropical diseases during the war was the discovery of effective insect repellents and their manufacture on a large scale. The most effective compounds in widespread use were methyl phthalate and 2-hexanediol-1,3. Work in this field has been continued, however, and it was reported recently by Jachowski and Pijoan (Naval Medical Research Institute) that two recently studied compounds, 2-phenylcyclohexanol and β-tetralol are more effective than those in common use as mosquito repellents. A 70-30 mixture of the two compounds was found to be more effective than either one alone. Their effect was enhanced by the presence of a minor amount of oxidation product formed by contact with oxygen of the air. β-Tetralol gave some trouble because of skin reactions, and in searching for a substitute 2-cyclohexylcyclohexanol was found to be even more effective. Preliminary tests indicate that it does not have undesirable effects on the skin.

NEW COMPOUNDS

Progress in chemistry may be measured not only by reasearch papers—just as important and perhaps of more immediate practical value is the announcement that a new compound or a new group of compounds has become commercially available in pilot plant or larger quantity. The end of war demands has permitted many of the chemical companies to devote time to the development of new products, and many of these are being listed as available for the first time. Sodium hydride is an interesting newly available basic material which reacts with a wide variety of acidic compounds to give a sodium salt with liberation of hydrogen. It is also somewhat surprising to see 90 per cent hydrogen peroxide freely available. In addition to the fluorine containing refrigerants already marketed, a new one, chlorodifluoroethane, is now on the market. In the field of nitrogen compounds many previous museum products are now available for consideration. These include long-chain amines such as "stearyldimethylamine," a variety of guanidine derivatives, phenylacetamide, nitrobenzoyl chlorides, and dimethylhydantoin, to mention only a few. With a host of new products becoming available and with chemical production running at a rate of nearly 400 per cent that of 1939, the future of the chemical industry looks promising indeed.

CLASSIFICATION OF ORGANIC COMPOUNDS

For many years organic chemists have classified or grouped carbon compounds by the system used in Beilstein's *Handbuch* or by some minor variation of this scheme. In recent years and particularly during the course of work on projects fostered by the war, the shortcomings of any such method became increasingly evident. The problem arises because efforts are being made in many fields to correlate the structures of organic compounds with a set of biological or physical properties. Since most of the organic compounds now being synthesized for study contain not one but many (perhaps as many as ten) functional groups, no one classification scheme can possibly fill everyone's needs. One investigator may wish to have grouped together all compounds having a particular set of three groups, whereas another scientist in the same laboratory may need for another purpose a classification involving another set of functions leading to quite a different arrangement. What promises to be a useful approach to this problem is to adapt the use of punched cards which can be sorted by International Business Machines. Each card represents a compound which is coded so that each of its important functions is listed. Then the cards can be sorted according to any set of characteristics one may choose. When many thousands of compounds are being dealt with sorting by machine becomes more convenient and quicker than classification by visual inspection. This approach to the handling of data on the hundreds of thousands of organic compounds now known may be the most important step in advancing the science, since the standardization of organic chemistry nomenclature first got under way.

ELECTROCHEMISTRY

By COLIN G. FINK
PROFESSOR, COLUMBIA UNIVERSITY

GENERAL

A review of Electrochemistry for the year 1946 is not merely a review of progress during that year, but is actually a review of certain electrochemical products and processes originating within the last four or five years. A number of the electrochemical advances released for publication during 1946 were discovered or developed during the Second World War. Furthermore, certain electrochemical inventions are still rated as "secret" and will probably not be released for publication within the next five years.

DRY CELLS AND BATTERIES

Ordinary dry cells, such as the flashlight batteries, deliver practically no energy at —40°C. Milton E. Wilke of the Burgess Battery Company discovered that adding lithium chloride to the electrolyte of the cell of the Leclanché type makes the cell operate satisfactorily in locations such as Greenland and Iceland as well as at high altitudes.

The U. S. Bureau of Standards likewise brought forth two types of dry cell that furnish energy satisfactorily at —30°C and below. The one involves an electrolyte comprising an aqueous solution of methylamine hydrochloride and zinc chloride with added ammonium chloride. The other cell has a calcium chloride, zinc chloride, ammonium chloride electrolyte. The addition of calcium chloride produced a cell of remarkably constant voltage.

The U. S. Naval Research Laboratory investigated the silver oxide, zinc cell as to its ability to serve as a high-rate primary battery. It is light in weight and will furnish current at a steady voltage even at high discharge rates. The cell is filled with electrolyte just before using.

A radical departure in electric cells was reported upon by the Bureau of Standards at Washington. Lead dioxide is used as the positive active material and a solution of fluoboric acid or perchloric acid as electrolyte. The cells have an exceptionally good watt-hour capacity and operate satisfactorily at low ambient temperatures such as are encountered in radio sonde operation.

ZIRCONIUM, NEW METAL OF COMMERCE

Zirconium metal is no longer a member of the rare metal class. It is being commercially turned out by the pound. Two widely different methods result in a brilliant white, ductile metal: the iodide method, originating in Holland, and the magnesium reduction method originating in America. The metal is highly resistant to corrosion. It is used in the vacuum tube industry where it serves as a very efficient getter, removing most of the residual gases in the tube. Another valuable property of zirconium metal is the small emission of secondary electrons. In the production of rayon, zirconium is extensively used for the spinnerets.

In the alloy field zirconium has for years been used as an efficient scavenger for steel on account of its high affinity for sulfur, oxygen, and nitrogen. During the year master alloys of zirconium and magnesium were marketed containing from 40 to 60 per cent of zirconium. Ingots six feet long and three feet in diameter were produced.

Of special interest is the new concentrated-arc lamp in which zirconium is the cathode and molybdenum the anode. It was developed by the Western Union Telegraph Company for signal purposes. In nature, zirconium is more abundant than copper or lead or tin.

ELECTROWINNING

The electrowinning of copper, zinc, and manganese are well established industries located at Chuquicamata, Chile, Great Falls, Mont., Knoxville, Tenn., and elsewhere. Semi-commercial tests were made on electrowinning of cobalt and of chromium which seem promising. High grade ores of all metals are being rapidly exhausted, and electrowinning of metals from their ores is particularly inviting in the case of lean ores.

DIELECTRICS

With the development of a wide variety of plastics the question arose in the minds of many whether one or the other of these new plastic products could be industrially applied as electric insulation, in place of rubber, varnish, mica and other old time standards. The Dow-Corning Corporation and the General Electric Company investigated the new plastic products, called silicones, compounds of carbon, hydrogen, and silicon. Various compounds have been isolated. The wide range of their physical properties adapt them to a large number of uses. The liquid silicones have exceptional electric properties. Grease-like silicones are suitable for high temperature lubrication. The silicone varnishes are good insulators that withstand relatively high temperatures. The silicone elastomers are interesting as dielectrics because of their rubbery properties combined with high thermal stability.

FUSED ELECTROLYTES

In the fused electrolyte industry, comprising such products as sodium, aluminum, magnesium, and calcium, the center of attraction was the production of fluorine gas. Interest was greatly stimulated by the findings that Germany had developed, during the war, new cells for the making of fluorine. This gas is the most powerful oxidizing agent we possess and finds wide application in the production of organic compounds.

The coloring or "dyeing" of aluminum has aroused new interest and we may soon see our favorite silk dies decorating a wide variety of aluminum products.

ELECTROPLATING

Chromium plating the inside of gun barrels for wear resistance was widely practiced during the Second World War, both in America and in Europe.

Renewed interest was manifested in the codeposition of tin and copper (speculum, 45 tin, 55 copper). The deposit is hard, wear resistant as well as corrosion resistant. It is not attacked by foods highly acid or by those containing sulfur.

Unexpectedly favorable results were obtained by phosphating (Parkerizing) steel surfaces before electroplating. A decided increase in corrosion resistance resulted and remarkably good adhesion of the plate.

Plating steel strip or wire before fabricating has become an established procedure and we may look forward to a decided reduction in the cost of plated steel parts.

BEARINGS

To meet the ever increasingly exacting demands of the aeroplane builders porous-bearing surfaces were developed which retained the lubricant in most satisfactory fashion. Bearings of aluminum and of chromium plate were particularly successful.

The Koppers Company of Pittsburgh, Penn., published details of a method of preparing piston rings with a porous chromium electroplate. The wear of the cylinders and barrels was reduced by as much as 50 to 80 per cent.

Electrodeposited indium-lead bearings continued in demand. They are very resistant to acids that may occur in lubricating oils. The drawing of aluminum alloys through dies is greatly facilitated by plating the bearing surfaces with indium over lead or tin or silver.

BIOLOGY

ORGANIC EVOLUTION AND GENETICS

By Myron Gordon
New York Zoological Society

GENETICS OF NATURAL POPULATIONS

Dr. Sewall Wright of the University of Chicago and Dr. Th. Dobzhansky of Columbia University continued their study and analysis of the "Genetics of Natural Populations" and published their results in *Genetics* (31:125-156, 1946). They stated that rapid changes in the genetic composition occur in populations of *Drosophila pseudoobscura* which inhabit certain localities on Mount Jacinto, California. These changes are cyclic and connected with the succession of the year's seasons. Analysis of the data has led to the working hypothesis according to which the changes in the relative frequencies of the gene arrangements are induced by natural selection in response to the seasonal alterations in the environment. The gene arrangements may be in themselves adaptively neutral (that is, free from position effects), but they contain different gene complexes which make their carriers adapted to different seasonal environments. Since the changes in the composition of the populations are considerable and rapid, the chromosomal types concerned must be subject to intense selection pressures. The selective advantages and disadvantages that must be postulated are, indeed, high enough to justify an attempt to detect them in laboratory experiments.

From many elaborate tests, they concluded that the experimental results demonstrate clearly that there may be selective differences between chromosome types derived from the same locality and that these may be of such a nature as to result in the indefinite persistence of several types in such a locality. The marked rise in frequency of Standard and decrease of Chiricahua in summer, observed to occur in nature in the locality from which the flies were collected, is analogous to the experimental reaction in high temperature, and it is tempting to compare the lack of change in artificial population at 16.5° with the constancy observed in the natural ones during fall and winter. The changes which occur in nature during spring (the reverse of those in summer), however, have not been reproduced in the population cages. Mass migration at this time from the population high in the mountains would explain the results qualitatively, but it would be difficult to reconcile this with the results of earlier experiments on the rate of dispersion of the flies in nature. It appears that there are important factors yet to be discovered.

In another paper on the "Genetics of Natural Populations," Dr. Th. Dobzhansky indicated that species of Drosophila show little variability as insect species go. Apart from a size variation which is mostly environment, individuals that compose natural populations are as a rule uniform in appearance. Notwithstanding this external uniformity, natural populations of Drosophila contain a great store of genetic variants. The principal components of this store are recessive autosomal genes which, when homozygous modify the viability, development rate, fertility, and other properties of their carriers. These genes are present in the populations mostly concealed in heterozygous condition.

The concealed recessive variants are detected with the aid of experimental procedures, the essential part of which is obtaining individuals homozygous for chromosomes or chromosome sections which were carried in wild individuals in heterozygous state. Homozygotes display in their phenotype the effects of the recessive that were hidden in heterozygotes. The most frequently used version of this technique consists in crossing wild flies to laboratory strains which have some chromosomes marked by appropriate mutant genes and inverted sections. Flies are eventually obtained which carry a certain wild chromosome in duplicate, while the sibs of these flies carry the same chromosome only once. Comparison of the homozygotes and heterozygotes for the chromosome permits the detection of any recessive factors which this chromosome may carry.

It is evident that the above technique reveals only the net effects of homozygosis for whole chromosomes. How many genes may be involved in the production of these effects is not immediately apparent. Suppose, for example, that the homozygotes for a certain wild chromosome have a lower viability, a slower development rate, and some visible morphological peculiarity not present in their heterozygous sibs (such diversified effects of homozygosis for wild chromosomes are frequently met with in the actual experiments). What is the genetic basis of these changes? It is possible that the chromosome in question contains a gene for the low viability, another gene for the slow development, and still another for the morphological change. It is likewise possible that this chromosome carries a single gene with manifold effects responsible for the whole complex of characters. Finally, several or many genes may be involved in the production of each character, some of these genes having manifold effects and others apparently restricted fields of action. Experiments described in this article have been devised to discriminate between these possibilities. The importance of this problem from the standpoint of population genetics is considerable. The amount of potential variability stored in natural populations will be much greater if the properties of wild chromosomes are determined by multiple genes than if they depend upon single genes or very few genes. The amount of variability potentially available to the species determines its evolutionary plasticity. In the present experiments, the gene contents of three wild second chromosomes of *Drosophila pseudoobscura* from Mount San Jacinto, California, have been analyzed. It can be shown that these chromosomes carry complexes of genes which are capable of giving rise to a large amount of variability by recombination.

Dr. John A. Moore of Barnard College, Columbia University, reported a case of "Incipient intraspecific isolating mechanisms in Rana ripiens" (*Genetics* 31:304-326, 1946). The common green frog, *R. pipiens* from many localities has been used in intraspecific hybridization experiments. These localities can be arranged in a series that reflects the results of these experiments: (1) Vermont (and Wisconsin), (2) New Jersey, (3) Louisiana, (4) central Florida, (5) southern Florida, (6) Texas. This series also corresponds to the decreasing latitude of the localities, except for Texas. Hybrids between adjacent members of the series are normal or nearly normal in rate of development and morphology. In hybrids between progressively more distant members of the series, there is a retardation in rate of development, and morphological defects become pronounced. Crosses between the end members of the series result in a high degree of hybrid inviability. The types of morphological defects follow certain definite patterns. Hybrids derived from northern eggs (or from females from localities low in the series) and southern sperm (or from males from localities high in the series) have enlarged heads and circulatory system defects. Hybrids derived from southern eggs (or from females from localities high in the series) and northern sperm (or from individuals from localities low in the series) have reduced heads with fusion of suckers, fusion of olfactory pits, absence of mouth, and eye abnormalities. It is thought that evolution in this case involves the synthesis, through the action of natural selection of adaptive genomes which can incidentally act to isolate the populations in which they occur. These isolating mechanisms arise, therefore, as a byproduct of adaptation.

Dr. D. U. Gerstel of the Division of Genetics of the University of California at Berkeley summarized his study of "Inheritance in Nicotiana tabacum" with especial reference to the mechanism of chromosome substitution which appeared in *Genetics* (31, 421-427, 1946) as follows: The transfer of genes from one species to another frequently is impossible because of failure of the chromosomes to conjugate and to cross over in the hybrid. Substitution of a pair of chromosomes, where feasible, is a means of overcoming this difficulty. Such substitution may occur in plants which have one or more *N. glutinosa* chromosomes in addition to two full sets of *N. Tabacum* chromosomes. In these plants meiotic irregularities such as nonconjunction between the members of a *Tabacum* pair or trivalent formation between a tobacco pair and a *glutinosa* univalent may result in the production of sporocytes containing only 23 chromosomes of tobacco, besides one or more *N. glutinosa* chromosomes. A homologous *N. glutinosa* chromosome may then take the place of a tobacco chromosome. The causative irregularities may be observed in the meiosis of trisomic plants with 24 pairs of tobacco and a single *N. glutinosa* chromosome, and their occurrence has been demonstrated indirectly from the metaphase configurations of a family of plants derived from a pentaploid with the constitution of 24 *N. Tabacum* pairs and 12 *N. glutinosa* univalents. Two cases of accomplished substitutions were shown to have their origin in the megasporogenesis of pentaploid plants.

PRODUCTION OF GERMINAL MUTATIONS CHEMICALLY

Under the title of "Genetic analysis of the induction of tumors by methylcholanthrene. IX. Induced and spontaneous adenocarcinomas of the stomach of mice," Dr. Leonell C. Strong of Yale University School of Medicine described in the *Journal of the National Cancer Institute* (*5*:339-356, 1945, 231) pathologic lesions which were obtained in the pyloric part of the stomach of mice following the subcutaneous injection of 1 mg. of methylcholanthrene dissolved in 0.1 ml. of sesame oil, when the mice were 60 days old. Of these 186 were adenocarcinomas, 19 were adenomas, and 26 were adenomatous hyperplasias. These gastric tumors occurred singly or in association either with malignant changes in the forestomach or with malignant changes in other parts of the body (locally appearing epidermoid carcinoma or fibrosarcoma and adenoma or adenocarcinoma or bronchiogenic carcinoma of the lungs). The gastric tumors appeared in strain NHO mice only after the early appearing local tumors were partially suppressed or completely inhibited by genetic selection toward resistance. The untreated descendants of the mice developing adenocarcinoma of the stomach after the subcutaneous injection of methylcholanthrene continue to develop this lesion spontaneously. The action of methylcholanthrene may be: (1) The conversion of gastric mucosa in cancer; (2) the production of a germinal mutation in a genetic entity.

Dr. C. Auerbach and Dr. J. M. Robson of the University of Edinburgh, Scotland, claimed (*Nature 157:* 302, 1946, "Chemical Production of Mutation") that mutations have been produced in Drosophila by mustard gas at rates comparable to those from X-rays. These include sex-linked lethals with rates up to 24 per cent, visibles in which in treated males the per cent of fractionals was 30-50 per cent higher than with X-rays, and chromosome rearrangements (at a lower rate relative to sex-linked lethals than with X-rays). The mutagenic action appears to be exercised directly on the chromosomes, they stated.

POLYPLOIDY AND ANIMAL EVOLUTION

In response to several investigators' suggestion that in view of the enormous number of polyploid species and varieties which are now known in plants the hypothesis that something of the same kind may have occurred, although less frequently, in the evolution of the Metazoa, Professor M. J. D. White of University College, London, England, writing in the *American Naturalist* (80:610-618, 1946), made his reply in a paper entitled: "The Evidence Against Polyploidy in Sexually-Reproducing Animals." His remarks may be summarized as follows: One can say that, apart from species with obligatory or facultative parthenogensis the highly anomalous case of the Cecidomyidae and a somewhat doubtful instance in the Coccidae insects, the evidence for polyploidy in the bisexual species of animals is so equivocal that it must seriously be doubted if any such polyploid species exist. Even in the hermaphrodite groups polyploidy seems to be extraordinarily rare (far more so than in most groups of higher plants). This is possibly due to the rarity of self-fertilization in animals (a single tetraploid individual mating with a diploid would produce only triploid offspring which would be sterile on account of irregular meiosis). Apart from this there is the possibility that the nuclear cytoplasmic volume relationships have a smaller degree of tolerance in animals than in plants.

HETEROSIS

Dr. John W. Gowen, Janice Stadler, and Dr. Leslie E. Johnson, writing in the *American Naturalist* (80:506-531, 1946) on the subject of the mechanism of heterosis, concluded from their study of vigor in races, and the inbred and outcrossed "homozygous" lines from them that inbred from continued brother by sister pair matings may retain some of their genes in heterozygous condition over many generations. "Homozygous" lines, formed by outcrossing, in general show lower yields than the inbreds from which they originated. This observation would agree with the hypothesis that the cause of hybrid vigor lies in differences in genic interaction between alleles and their reaction products. This result would not be expected if the cause of hybrid vigor lay in some, as yet unidentified, physiological stimulation resulting from the union of unlike gametes.

Dr. Wesley R. Coe reported upon "a resurgent population of the California bay mussel (Mytilus edulis diegensis)" in the *Journal of Morphology* (78:85-101, 1946). He claimed that during the past three years the above species has appeared on the coast of California in unprecedented numbers and over a widely extended territory. It is not limited to bays and inlets but is abundant also on the open coast. This exuberant population consists of a race of unusual vigor, with rapid growth of its constituent members to a larger size than is usual in that subspecies, with a high rate of multiplication and the establishment of flourishing colonies at distant localities and in situations unfavorable for long survival. It is suggested that some of the individuals responsible for this population may have been brought as free swimming larvae to the place of resurgence by the coastal ocean currents. The fortuitous union of two physiologically diverse but compatible genetic strains, together with exceptionally favorable environmental conditions, may, perhaps, have been the principal contributing agencies in the establishment of this population which has been so rapid. Examples of similar resurgent populations of pelecypods on the Pacific coast are reported.

MORPHOLOGY AND EVOLUTION

Prof. A. S. Romer of Harvard University wrote "The Early Evolution of

Fishes" which was published in the *Quarterly Review of Biology* (21:33-69, 1946). Dr. William K. Gregory of the American Museum of Natural History and Columbia University wrote "The Role of Motile Larvae and Fixed Adults in the Origin of the Vertebrates" in the same journal (21: 348-364, 1946).

"The Early History of the Idea of the Inheritance of Acquired Characters and of Pangenesis" was prepared by Conway Zirkle whose papers on this subject were reviewed in THE AMERICAN YEAR BOOK previously. This summation was published as volume 35 (part 2) of the new series of the *Transactions of the American Philosophical Society* (91-151, 1946).

MAINTENANCE OF PURE GENETIC STOCKS

At a meeting of the Committee on Plant and Animal Stocks of the National Research Council, held at Storrs, Conn., the following resolution was adopted: Resolved that the Committee on Plant and Animal Stocks believes that a definite threat to future advance in plant and animal improvement exists in the losses of essential genetic stocks that have occurred and are likely to occur from lack of adequate facilities for their preservation, and be it further Resolved that to insure further advances in the fields of bacteriology, pathology, physiology, genetics, and plant and animal breeding dependent on such material, steps should be taken to provide facilities for preserving basic genetic stocks, and be it further Resolved that in recognition of the fundamental importance of this problem in all fields of biological sciences in relation to human welfare, the Committee recommends to the National Research Council such steps as may be deemed necessary to insure safeguarding of this scientific trust, either through the Committee or otherwise. This resolution was submitted to the Agricultural Board for adoption. Subsequently the Committee on Plant and Animal Stocks was made a permanent part of the Agricultural Board.

In a specific proposal five groups of stocks were listed as important for preservation: 1. Species and subspecies; 2. Leading commercial varieties; 3. Varieties which in the opinion of the specialists are of value in plant-breeding, *e. g.*, varieties which are resistant to specific diseases; 4. Stocks of known genetic composition (mutants). New types are to be added regularly to each of these categories. It was pointed out that in many parts of the world, *e. g.*, the U.S.S.R., China, and South America, there is imminent danger that primitive varieties of crop plants will be wiped out by the introduction of improved stocks. Since the primitive varieties may contain many factors which are of great value for improvement and research purposes, it is imperative that they should be collected before it is too late or, wherever possible, maintained in their natural habitat.

A conference on mutations was called by the Committee on Growth of the National Research Council on Jan. 26, 27, 28, 1946 in New York City. The primary purpose of this Conference was to bring together research workers for a discussion of current problems concerning mutations. The scope of the Conference is indicated by the following papers listed by groups:

Spontaneous Mutations: Muller, H. J.: Problems in spontaneous mutation; Sturtevant, A. H.: Spontaneous mutation in Drosophila; Delbruck, M.: Studies of bacterial mutability with the aid of bacterial viruses; Ryan, Francis J.: Back-mutation and adaptation in Neurospora; Stadler, L. J.: Spontaneous mutation and gene variability in maize; Rhoades, M. M.: Influence of heterochromatin on mutation in maize.

Induced Mutations: Stadler, L. J.: The rarity of gene mutations induced by X-rays; Oliver, C. P.: The need to consider modifiers and manifold effects of a gene in the search for mutations; Snell, G. D.: Methods for the study of mutations in transplantable tumors; Demerec, M.: Mutations in *Escherichia coli* induced by ultraviolet and by X-rays; Delbruck, M.: An induced specific mutation of a bacterial virus.

Extranuclear Factors in Heredity: Rhoades, M. M.: Plastid inheritance; Lindegren, C. C.: Activation and inhibition of a gene or its cytogene; Spiegelman, S.: Determining factors in the synthesis of enzymes. Sonneborn, T. M.: Current work on cytoplasmic factors in Paramecium. Heston, W. E.: The milk factor in mammary cancer mice.

The Nature of Genic Action: Stern Curt: Effects of combinations of alleles in normal and changed positions; Oliver, C. P.: A study of gene action as determined by analyses of alleles of lozenge; Schultz, Jack: Somatic pairing and the position effect; Irwin, M. R.: Aspects of the nature of genetic action; Horowitz, N. H.: Gene action in Neurospora; Spiegelman, S.: Energy specificity and the mechanism of the control of enzymatic constitution.

Genetic Aspects of Atypical Growth: Heston, W. E.: Inheritance of susceptibility to tumor formation; Gordon, Myron: Genetic aspects of atypical growth of pigment-bearing cells leading to melanoma; Kidd, J.: The nature of a distinctive constituent of Brown-Pearce tumor cells; Jones, D. F.: Growth changes in maize endosperm.

Present Concept of Physical Nature of Genic Substances: Muller, H. J.: Some aspects of the gene as viewed by a mutationist; Schultz, J.: Heterochromatin; Mirsky, A. E.: Chemical constitution of chromosomes.

This Conference is evidence that geneticists are aware of the problem of cancer. From funds made available to them by the American Cancer Society, many of them are engaged in research in the fundamental properties of cellular growth in the normal and atypical phases.

SEXUAL ISOLATING MECHANISMS

Dr. Ernst Mayr of the American Museum of Natural History described his "Experiments on Sexual Isolation in Drosophila" in the eighth of a series of such studies under the subtitle "The nature of the isolating mechanisms between Drosophila pseudoobscura and Drosophila persimilis" in the *Proceedings of the National Academy of Sciences* (32:128-137, 1946). Dr. Mayr stated that the two species of fruit flies live in the same area yet under natural conditions they do not hybridize, yet under laboratory conditions they may be induced to do so. Dr. Mayr found that there were no apparent differences in mating behavior other than the greater activity of the *pseudoobscura* species. Yet when given choices in their mating partners the species mated with their own kind far more often than with the unlike species. When matings were successful with opposite species, the females receiving the sperms apparently terminated the copulatory act far sooner than when copulation took place with like species. This differential in copulation duration may account for the success or failure of copulation to eventuate in fertilization and the production of broods. This barrier prevents the occurrence of many hybrid forms in nature should, by chance, matings between the species take place.

George Streisinger of Cornell University studied three remarkably similar species of Drosophila belonging to the Cardini species group: *Drosophila cardinoides* Dobzhansky and Pavan from Iporanga and from Mogi das Cruzes, State of São Paulo, from Teffe, State of Amazonas, from Belem, State of Para, in Brazil, and from Guatemala in Central America. *Drosophila polymorpha* Dobzhansky and Pavan came from Bertioga and from Araras, State of São Paulo, Brazil. *Drosophila neocardini* Streisinger came from Teffe, Amazonas, Brazil. At first these species seemed alike but morphological differences were found to separate them including distinct structures of the male genitalia, but the most convincing and conclusive method of classification proved to be their behavior in crosses. The species showed very strong psychological or sexual isolation. Interspecific mating occasionally occurred but in no case were offspring produced.

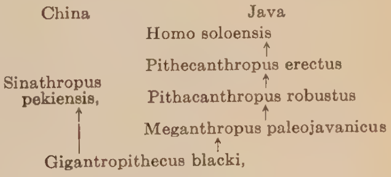
A study on "Antigens, Antibodies and Genes" was made by Prof. M. R. Irwin of the University of Wisconsin and published in *Biological Reviews* (21:93-100, 1946). This study reviewed the finding about antigenes as they occurred in one species of bacteria, the pneumococcus, and in the cells and organs of mammals and birds. The finding in immunolochemistry that substances simpler than proteins, if linked to proteins, may produce biological specificity in bacteria, points the way, Dr. Irwin stated, to a comparable concept of specificity in other organisms. He called attention to the transformation of types in the pneumococci, and to the activating principle, a nucleic acid, in one such change. He reviewed the antigens of the red blood cells in man and he referred to the antigenic relationships of species of birds which produce fertile hybrids and backcross hybrids. From such studies he analyzed the genetic relationships in terms of their cells and serums. Many genes affect the antigenic complex of the red blood cells, some of which acted more or less directly so that each produced a particular antigen. Others were capable of effecting the same combination that two or more alleles produced, and he cited instances of cellular substances which are the result of the complementary action of genes.

Dr. Stanley E. Flanders of the University of California Citrus Experiment Station at Riverside described in *Science* (103:555-556, 1946), "Haploidy as a Factor in the Polymorphic Differentiation of the Hymenoptera." Haploid, he declared, is lethal in many species which are disinclined to oviposit before mating. Polymorphic individuals in species in which differentiation is detected by the partial absorption of the ripe ovarian egg should be more strongly differentiated than the queen bee and the worker and less so than the alternating generations of certain gall wasps. The absorptive process has a graduated effect on eggs. In social species the low incidence of male polymorphism may result from the mortality of the partially absorbed unfertilized egg or the small nutritional needs of haploid individuals.

Prof. E. Newton Harvey in a paper entitled "Can the Sex of Mammalian Offspring Be Controlled?" published in the *Journal of Heredity* (37:71-73, 1946), suggested that it might be possible to separate male producing and female producing sperm by centrifuging seminal fluid in a density gradient of dextrin-Ringer solution. The female producing sperm, containing excess chromating in the X-chromosome, is calculated to have a slightly greater density than the male producing Y sperm. The two types of sperm would, therefore, form separate layers in a sedimentation equilibrium. However, the density difference of X and Y sperm, based on estimation of chromosome density and volume, is so slight that accurate temperature control would be necessary; the separation could only succeed, he claimed, in vacuum type of turbine centrifuge used in sedimentation of larger molecules.

BOOKS

Franz Weidenreich was the author of *Apes, Giants and Man* (Univ. of Chicago Press). It contains 122 pages, six maps and 78 figures. The book first discusses man's anthropoid ancestry and the specialization in long bones, axial skeleton, and craniovertebral relationships attendant upon the assumption of the upright position. The author outlines the evolutionary sequence of the recent fossil hominid discoveries in Java and China as follows:



In a chapter on human origins, Weidenreich traces modern man back to the first hominid stages and disputes modern claims to "racial mentality."

J. E. Nichols of the Imperial Bureau of Animal Breeding and Genetics of Edinburgh, Scotland, wrote *Livestock Improvement in Relation to Heredity and Environment*. This was published by Oliver and Boyd and consists of 208 pages, seven plates, and 24 figures. There is a concise statement and explanation of the laws of heredity; the application of these laws to the problems of selection, inbreeding, crossbreeding and the building of new breeds. The author places special emphasis on the role of environment and shows that different effects may be brought about in two animals of the same genotype. The book has an extensive bibliography.

"Animal Cytology and Evolution" by M. J. D. White was published by the Cambridge University Press (Macmillan) in the latter part of 1945; it consists of 375 pages and covers the following subjects: the nature of the evolutionary process, the structure of mitotic chromosomes, salivary-gland chromosomes, the mechanisms of structural rearrangements, meiosis chromosomal evolution in wild populations, the evolution of chromosomal numbers and forms, the evolution of meiosis and chromosome cycles, hybridization and the causes of hybrid sterility, the evolution of the sex-determining mechanism, sex-determination by male haploidy, the evolution of parthenogenesis and in the final chapter, cytology and evolutionary patterns. Dr. White's object in presenting the enormous number of cases which he analyzes is to discuss the bearing of animal cytology upon the problem of the mechanism and process of evolution.

ENTOMOLOGY

ROGER B. FRIEND
CONNECTICUT STATE ENTOMOLOGIST

GENERAL

The pursuit of insecticidal research continues to dominate the field of entomology, embracing not only the expansion of investigations centered around DDT, but also the search for other insecticides better than DDT or at least useful where DDT fails. It also enters into certain fields of pest control where the use of insecticides has been heretofore impracticable.

Much of the recently acquired information in this field, both published and unpublished, has been summarized in 12 Abstract Bulletins issued by the Insect and Rodent Control Committee Coordination Center of the National Research Council, the outgrowth from a war emergency organization. In 1946 the Committee was succeeded by the Advisory Committee of the Chemical-Biological Coordination Center set up by the National Research Council. The organization of this Advisory Committee revolves around the application of chemistry, physics, and biology to health and agriculture. Entomology is one of those fields, and there is a subcommittee of entomologists. One of its current activities is the chemical and biological codification and screening of chemical compounds. This is of great importance to entomological research, particularly as it concerns insect physiology and insecticides.

DDT DEVELOPMENT

DDT has developed into a powerful weapon for controlling insect pests of man and of domesticated animals because of its direct action on larval and adult forms and its residual action. For the control of flies, including mosquitoes, it has become invaluable. Many governmental agencies, Federal and state, have carried out extensive investigation in the field of mosquito control with this and other insecticides. A dose of only 0.1 pound per acre in the form of an emulsion will control mosquito larvae, and three quarts per acre of a 5 per cent solution will control adults in forests for two or three days. When applied at the rate of 1 part per million to water used to irrigate rice fields, effective control of the larvae of *Aedes* and *Psorophora* was obtained. The effect of DDT may be modified by changes in pH of the water or by variations in the content of organic matter. TDE (1,1-dichloro-2,2-bis(p-chlorophenyl) ethane), a compound related to DDT, has been found equal to DDT for controlling the larvae of certain species. Federal laboratories have tested several thousand chemical compounds against *Anopheles* larvae, and some of them show some promise.

FLY AND MOSQUITO CONTROL

Under certain conditions fish exert considerable control of mosquito larvae, and the literature on this subject published from 1917 through 1942 has been reviewed by Gerberich (*Amer. Midl. Nat.* 36, 1946). Some 216 species of fish have been used in controlling 35 species of mosquitoes.

Blackflies (*Simulium* app.) are serious blood sucking pests which breed in running water and hence have been difficult to control in the larval stage. It appears that certain species, at least, can be eradicated by applying DDT to the water at as low a dose as one part in 10 million.

In the control of mosquitoes, forest insect pests, and other insects inhabiting wild areas there is some danger to other animal species, both terrestrial and aquatic. However, at the doses necessary to kill pests, less than 0.5 pound per acre on water and one pound per acre on land, there appears to be little danger of disastrous results.

DOMESTICATED ANIMAL AND HOUSE PESTS

The production of meat and milk is markedly affected by the activities of pests of domesticated animals. In experiments carried out in Kansas it was found that a DDT spray applied to cattle effectively controlled horn flies and the sprayed animals gained weight more rapidly than those not treated. The application of one pound of DDT produced over 1,200 pounds of beef. Spraying dairy barns effectively controls flies. Applications of DDT are also effective in controlling the Gulf Coast tick, the winter horse tick, and lice affecting poultry, as well as other animal pests. There is no danger to the animals if the insecticide is properly used.

For the control of pests of the household, stored products, etc., this insecticide is very useful. Houseflies, bedbugs, roaches, silverfish, booklice, carpet beetles, seed pests, hide beetles, dog and cat fleas are among those successfully combatted.

POTATO PESTS

DDT has been used to control many pests of agricultural crops, and of particular interest is its effectiveness against pests of potatoes and alfalfa. The most serious pests of potatoes over the country as a whole are flea beetles, leafhoppers, and aphids, all of which DDT controls. The extraordinarily high potato yields obtained in 1946, with a resulting bumper crop, were in part owing to the widespread use of this insecticide.

THE LYGUS AND ALFALFA

The alfalfa seed production in many parts of this country has fallen rapidly in the last 20 years. There are two entomological problems involved, the injury to alfalfa by sucking bugs, mainly of the genus *Lygus*, and the pollination of blossoms by several insect species. The situation in Utah, ably described by Sorenson (5th Am. Fac. Res. Lecture, Utah State Agric. Coll.) illustrates the nature and magnitude of the problem. About one-third of the cultivated 1,361,263 acres in Utah and 38.43 per cent of all the irrigated land in the state are devoted to alfalfa production. During the ten-year period 1936-1945, 34,500 acres of this produced a seed crop. Seed production averaged 4.93 bushels per acre in 1920 to 1924 and reached a peak of 6.37 bushels in 1925. Since then it has declined steadily to about 1.00 bushel in 1945. *Lygus* feeding blasts the buds, renders seed worthless, and reduces the vegetative growth. These bugs are abundant in alfalfa fields.

Treatment with DDT has resulted in a decrease in the population of bugs and a significant increase in yield of seed. In the best plot, treated with 5 per cent DDT in 1945, the treated field yielded 6.48 times the untreated check. Carlson and Lieberman (*Jour. Amer. Soc. Agron.* 38, 1946) also reported a significant increase in seed production following treatment for *Lygus.* Lieberman stated the DDT residue on the alfalfa following threshing was, in his experiment, 10 p.p.m. and before threshing 17 p.p.m. This must be considered in relation to the effect on live stock fed alfalfa. The median lethal dose of DDT is over 300 mg. per kilogram of body weight for cows and horses (see Bishopp, *Amer. Journ. Publ. Health* 36, 1946). According to Appleman and Sears (*Jour. Amer. Soc. Agron.* 38, 1946) 10 per cent DDT dust did not inhibit the growth of alfalfa at less than 100 pounds DDT per acre, nor did it reduce root nodulation at less than 1000 pounds per acre. Although all problems involved in the use of DDT to protect alfalfa are not answered to date, a promising insecticide is now available.

In order to obtain the maximum amount of alfalfa seed, it is necessary to secure adequate pollination, and this pollination involves tripping of alfalfa blossoms. According to Tysdal (*Amer. Jour. Agron.* 38) less than 5 per cent of alfalfa flowers in Nebraska set seed without tripping, and there are in this region at present an insufficient number of insect trippers in all fields. Carlson (*Ibid.*) found in Utah that, where pollinators were excluded by caging, only 10 to 17 pounds of seed were produced per acre, whereas under open pollination 154 to 254 pounds of seed per acre were produced. According to Vansell and Todd (*Ibid.*), bees are the chief agents in alfalfa pollination in Utah. Bees, however, may prefer the blossoms of plants other than alfalfa, and, if such plants are available, the alfalfa may be neglected. The important species working in alfalfa flowers are, aside from honey bees, certain native wild bees. The production of 500 pounds of alfalfa seed per acre necessitates the tripping of 38,000,000 flowers. Tripping insects are usually insufficient in numbers to accomplish this. In California, according to Lindsley (*Jour. Econ. Ent.* 39), the only significant pollinators of alfalfa appear to be bees, as no other insects deliberately trip the flowers. Wild bees, of which many species were found tripping alfalfa in different parts of the state, accomplished the major portion of pollinating this plant. Honey bees compared unfavorably with wild bees in both percentage and total number of pollen collectors.

DDT FORMULA INVESTIGATIONS

The investigations into the formulation of DDT have been vigorously pursued. One of the problems involved is the persistence of sprays under exposure to normal conditions in the region involved. According to Lindquist (*Jour. Econ. Ent.* 39), both ultra violet light and sunlight reduce the toxicity of DDT to houseflies. With high-boiling auxiliary solvents, this reduction is particularly severe. Use of a solvent for DDT residual sprays should be of the boiling range of kerosene. Goodhue, Fales *et al.*, Donovan, Lindquist *et al.*, Jones *et al.*, and Gersdorff (*Soap and Sanitary Chemicals,* 22) have discussed tests for evaluating the formulae of aerosols, the insecticidal value of the constituents, particle size, and the relative merits of DDT household sprays. One of the interesting developments in the utilization of DDT has been the impregnation of a fuse with this insecticide. The smoke generated by burning these fuses is toxic to insects (Pearsall and Wallace, *Soap and Sanitary Chemicals,* Vol. 22).

OTHER INSECTICIDE COMPOUNDS

Among the interesting insecticides other than DDT, about which certain information was published during the year, are compounds of diverse formulae and origin. The Department of Economic Entomology of the University of Wisconsin has recently compiled the information concerning the recent insecticidal tests of Sabadilla on a great many pests of diverse nature. Kearns and Ingle (*Jour. Econ. Ent.* 38) have discussed the toxicity of a chlorinated hydrocarbon insecticide of the empirical formula $C_{10}H_6Cl_8$ which appears to be promising for the control of many insect pests. Yun-Pei (Cornell University) has reported a series of tests which indicate that a compound consisting mainly of di- and tri-methyl naphthalene used as an extender in dusts increases the toxicity of rotenone and DDT to all of the 14 species tested and decreases aphid reproduction. Azobenzene has recently been developed as an insecticide of particular use for fumigating in greenhouses, as reported by Haring (*Jour. Ec. Ent.* 39). Benzene hexachloride, also known as hexachlorocyclohexane, has been found by several investigators to be very toxic to housefly larvae, certain bugs on cotton, particularly the cotton flea hopper, the tarnished plant bug and stinkbug, and some other insects. Tests of the usefulness of Ryania (a tropical plant), Rothane (also known as DDD and TDE) very similar to DDT in composition, the methoxy analog of DDT, the bromine and fluorine analogs of DDT, certain sulfones, the hexaethyl ester of tetraphosphoric acid, certain nitriles and dinitro compounds, benzyl benzoate, and hydroxypentamethylflaven have been carried out. (*Journal of Economic Entomology,* Vol. 38).

BIOLOGY OF MOSQUITOES

Certain information has been acquired regarding the biology of mosquitoes which is of great interest. The seasonal variations in certain species of *Culex* has been discussed by Michener (*Jour. N. Y. Ent. Soc.* 53). Jenkins and Carpenter (*Eccl. Monographs,* 16) have discussed the ecology of tree-hole breeding mosquitoes of Nearctic North America. There are eight species and one sub-species, of which all but three are widely distributed in the deciduous forests in eastern North America. Carpenter, *et al.* (*Amer. Mid. Nat. Monograph* No. 3) have published an excellent general treatise on the mosquitoes of southern United States, east of Oklahoma and Texas. This includes chapters on bionomics and relation to disease, techniques, morphological characters used in identification, taxonomy and distribution of the species. Gjullin (*Wash. Ent. Soc.* 48) has published a key to the *Aedes* females of North America.

Folger (*Physiol. Zool.* 19) has written a very interesting paper on the reactions of *Culex* larvae and pupae to gravity, light, and mechanical shock. Shock is a kinetic stimulus inducing movement. Gravity is a directive stimulus determining direction, whereas light acts in both ways. The larvae react to light intensity from above and below, but more strongly to light from above. Their position, that is, whether they are at the surface or at the bottom, influences the negative or positive reaction to light and gravity as well as shock.

Hovanitz (*Physiol. Zool.* 19) has published an interesting comparison of the mating behavior, growth rate, and factors influencing egg hatching in South American Hemagogus mosquitoes, these species being involved in the transmission of yellow fever in the forests of tropical America. Hovanitz deals particularly with the area of space needed for mating in dance, mating in flight or at rest, the type and frequency of egg laying, and the environmental influences on the female which affect the hatching of eggs.

INSECTS AND PLANT DISEASE

In regard to insect diseases and the general subject of injuriousness of insects to plants and insect nutrition, several publications are of interest. Steinhaus' excellent book entitled *Insect Microbiology,* deals with the association between insects and microbes, that is, extracellular bacteria, symbiotes, richettsiae, yeasts, fungi, viruses, spirochetes, protozoa, immunity in insects, etc. Beard has recently published a bulletin (*Conn. Agric. Expt. Sta.* No. 491) dealing with the biological aspects of the milky disease of the Japanese beetle. Jensen (*Proceedings of the Hawaiian Entomological Soc.,* Vol. 12) has discussed the virus diseases of plants and their insect vectors in Hawaii taking up the insect species known to transmit these viruses and the plant virus diseases known to occur in Hawaii with special reference to their transmission by insects. There are a number of these viruses in the island, many of which are of great economic significance.

Brett *et al.* have written an interesting paper on the cotton flea hopper in Oklahoma (*Oklahoma Agric. Expt. Sta. Technical Bul. No. T-24*). The injury to the fruiting buds or "squares" results from toxicity of the material injected into the plants by the insect and not from a virus-caused disease. The activity of this insect is responsible for the shedding of a high percentage of "squares." The results of tests made with the object of controlling this species are given, and, as in the case of *Lygus* bugs, DDT has proved effective.

FOOD HABITS OF INSECTS

Brues has published a very interesting volume called *Insect Dietary* (Harvard Univ. Press), in which he deals with the food habits of insects, the relation to structure and environment, the various forms of food utilized by insects and the methods of obtaining such food, and the role of insects as food for man and other organisms.

Hill (*Nebr. Agric. Expt. Sta. Bul. 143*) has discussed the influence of food plants on fecundity, larval development, and abundance of the tuber flea beetle in Nebraska. The type of food plants markedly affects oviposition and length of adult life. Potato foliage was found to be the most satisfactory food, giving highest egg production and lowest mortality.

TAXONOMY

Taxonomy is an old field of scientific endeavor and basic in biological research. Gregg (*Amer. Midl. Nat. 35*) has discussed the ants of northeastern Minnesota, of which there are about 40 species. Cresson (*Trans. Amer. Ent. Soc. 71*) has published a systematic annotated arrangement of the Neotropical Ephydridae (Diptera), and Johannsen (*Jour. N. Y. Ent. Soc. 54*) has revised the North American species of the genus Pentaneura (Tendipedidae: Chironomidae, Diptera). Dillon and Dillon (*Reading Public Mus. and Art Gallery Scient. Publ. 6*) have published Part II of their work on the Cerambycidae, the first part having been published in 1945. Blackwelder (*U. S. Nat. Mus. Bul. 185*) has compiled a checklist of the Coleopterous insects of Mexico, Central America, the West Indies and South America, of which Part IV was published during the year.

Chapin (*Smithsonian Misc. Collections* Vol. 106, No. 11) has written a review of the new world species of *Hippodamia* Dejean (Coleoptera: Coccinellidae). Benesh has revised the genus *Platycerus* (Lucanidae) (*Trans. Amer. Ent. Soc. 72*) as it occurs in the Holarctic regions. De la Torre-Bueno (*Entomologica Americana 26*) has continued his synopsis of the Hemiptera-Heteroptera of America north of Mexico. The genus *Corythuca* is of considerable interest to entomologists, both economically and otherwise, and the members of this genus of bugs are the subject of a monograph by Hurd (*Iowa State Col. J. Sci. 20*). Banks (*Psyche 52*) in his review of the Chrysopidae of Central America includes keys to genera and species and descriptions of other new species. Hanson (*Amer. Midl. Nat. 35*) has discussed the comparative morphology and taxonomy of the Capnidae (Plecoptera).

ECOLOGY OF INSECT POPULATION IN FORESTS

There is increasing interest about the ecology of the population of insects in forested areas, including those which inhabit the soil and the litter resting above it. Cole has studied the cryptozoan fauna of Illinois woodland (*Ecol. Monog. 16*). Most of these small organisms are poorly adapted for digging, very sensitive to dryness and omnivorous. They live in the litter in forests immediately above the soil, and Cole found them to consist mainly of spiders, centipedes, collembola, crickets, roaches, beetles, and ants. Most species reach maximum abundance where the forest is protected from grazing cattle, which is probably a result of the effect of close grazing on humidity. The animals are more abundant in the wet weather of early autumn, and the fauna changes early in autumn when immigration to and emigration from niches occurs. Spiders are more or less randomly distributed, but other forms exhibit contagious distribution with a tendency to form aggregations. Cole has found that the Charlier coefficient of distribution gives a satisfactory index of the intensity of the aggregation tendency. Weather influenced numbers found in cryptozoan habitat. Soil moisture had greatest effect.

Jones (*Amer. Midl. Nat. 35*) has studied the variations in abundance of certain invertebrates in deciduous forests in the same region. He divided the year into six seasons and listed the insects according to these divisions. Temperature, humidity, precipitation, light, wind, and enemies are important in population fluctuations. Food is, of course, significant. The climax condition is characterized by the presence of many species in small numbers. The time of hibernation in the fall may depend on mean temperature, rate of temperature fall, minimum temperature and the same general fluctuation in the spring affects emergence. The abundance of these animals is decreased by hot, dry weather.

Rice also studied the deciduous forest animal population (*Amer. Midl. Nat.* 35) in the lower vegetation and the ground to a depth of 10 cm. It was found that weather fluctuations affect the abundance and movement of animals markedly. A warm spell in early spring followed by cold weather was deleterious to them. Plant hibernating forms were more abundant in dry summer weather and ground forms in the wet summer. She determined the bird population and estimated the number of insects consumed by the nesting pairs of birds and their offspring during the season. Insects apparently move into forests from the adjoining areas and move down from the tree tops in October. The spring maximum of insects and migrating birds occurs in April.

In the study of any insect population, of economic importance or otherwise, the dissemination of individuals is important. Wolfenbarger (*Amer. Midl. Nat. 35*) has reviewed the literature and discussed the dispersion of small organisms, particularly the distance dispersion rates of bacteria, spores, seeds, pollen, and insects. He finds that this dispersion can be satisfactorily plotted by means of a logarithmic regression.

PLANT RESISTANCE TO INSECT INJURY

A great deal of interest has been taken recently in the development of species of economic plants which may be resistant to insect injury. This phase of insect control involves genetics as well as entomology and other pertinent sciences. Although no world-shattering discoveries came to light during the past year, the goal is alluring and sometimes attained. Winter wheat resistant to Hessian fly, sugar cane more resistant to sugarcane borers, corn more resistant to corn borers and earworms, alfalfa more resistant to pea aphids, and cotton more resistant to cotton aphids are cases in which progress is being made.

BOTANY

By HOWARD J. DITTMER
PROFESSOR, UNIVERSITY OF NEW MEXICO

EVOLUTION

Some comparisons of chemical ontogeny with chemical phylogeny of vascular plants were made by McNair, who came to the conclusion if chemical ontogeny is in any way the epitome of chemical phylogeny then we may have a pattern which may aid in the phylogenetic classification of plants by their chemical products. The carbohydrate-fat ontogeny was shown to have parallel phylogenetic representation. From this analysis monocotyledons are more primitive than dicotyledons, and archichlamydeae are more primitive than sympetalae. The occurrence of cyanogenetic glycosides is more prevalent in the angiosperms in the more advanced of the older groups and also in the more advanced families of the different orders. A similar paper by Synge discussed the chemical aspects of evolutionary processes as shown in the configuration of the amino acids of higher and lower organisms.

CYTOLOGY

Nirula of India described meiosis in Daemia of the Asclepiadaceae. He states that the achromatic figure is intranuclear in origin and that the nucleolus is a storehouse for chromatin. A nucleolus is formed in heterotypic telophase in association with each of the 12 haploid chromosomes. These coalesce during interphase to form one nucleolus.

Jeffry stated that the hypothesis of Chiasmatypy and the possibility of true sexual union taking place long after the junction of sperm and egg have no sound basis in fact. Fertilization occurs at the time of union of the gametes and all chromosome unions are end to end.

Stebbins reviewed the literature published in the last ten years on the cytological analysis of species hybrids. Emphasis was given to the origin of genetic sterility barriers between species.

A technique for counting numerous chromosomes is described by Chen. It requires the use of an ocular disk ruled off into a number of equal divisions (6) to facilitate observation of different areas of the nucleus, and a set of celluloid sheets, each having a six-inch square ruled off into six equal divisions, on which drawings are made of successive focal levels within the nucleus. The total number of chromosomes drawn on each sheet is determined, and the grand total number of chromosomes thus drawn represents the number of chromosomes in the nucleus.

GENETICS

Cook compiled a summary of plant patents published since 1931. Of 612 plant patents issued since then, 299 are for roses. Other ornamentals total 151 patents and 136 cover allegedly new forms of fruit or other agricultural products. The total represents about 0.1 per cent of the patents issued during this period.

A distinctively mottled-leaf character in winter squash (*Cucurbita maxima*) is described by Scott and Riner, and the inheritance of the character is presented. Leaf mottling is one of the few vegetative characters that is easily recognized, a fact which may make the character valuable as a marker in linkage studies. The mottled leaf is inherited as a single dominant to the normal uniform green color of leaf, giving three plants with mottled leaves to one with uniform leaf color in the F_2.

Sewall Wright presented the introduction to a symposium on genes as physiological agents. The nature of the gene, including its size, reproduction, specificity, mutation, and the role of the gene in growth and differentiation were considered. Production of proteins may be basically the only type of gene action. It is still undecided whether differentiation is directed by chains of gene-controlled reactions initiated by special local conditions or by genically induced mutations of plasmagenes.

Fries developed 12 physiological mutations (strains) in the fungus *Ophiostonia multiamulatum* by x-rays. The physiological properties were heritable. Polyembryony in *Asparagus officinalis* was studied by Randall who observed about 0.95 per cent polyembryony in various seed lots. Various chromosome numbers were also noted.

Bruce's explanation of hybrid vigor was presented by Richey in which the explanation revolves about dominant interaction as a cause of hybrid vigor.

ECOLOGY

Laird described the influence of lime, where arable crops were suffering seriously, on the yield of hay and the botanical composition of the sward on intensively cropped land in Ayrshire, as well as its influence on the grass seed sown 14 years later.

Flowering behavior and natural distribution of the eastern ragweeds (*Ambrosia*) as affected by length of day was described by Allard. Staminate flowers were predominant in association with the longer days while the pistillate expression was favored by very short days. As the plants became dwarfed from any reason, the pistillate expression becomes predominant owing to suppression of the staminate condition. This condition is also typical with the shorter days later in the season.

Jenkins found airplanes to be of great help in making rapid surveys of trees and plants producing strategic raw war materials in the American tropics where land travel was slow and difficult. Plants could be identified from altitudes up to 1,000 feet using distinguishing characteristics of the spp., type of habitat, and easily identified indicator plants. Speed of planes used was from 55 to 110 miles per hour.

Under conditions of southeastern Russia, Bialy noted that perennial grasses exert a strong desiccating effect on the soil, and it is essential to include a black fallow in the rotation to allow a supply of moisture to accumulate. Correct cultivation to produce a water-retaining structure and measures for snow retention are also important.

Bonck described plant succession on abandoned farmland in the vicinity of New Orleans, La. Three broad stages of succession were recognized: (1) An annual weed stage, (2) a perennial weed stage, and (3) a shrub stage, beginning in the second growing season and increasing to maximum size and density in the tenth year.

Weaver and Zink described the length of life of roots of ten species of perennial range and pasture grasses. Considerable variation occurred but over 50 per cent of the grass roots survived after three years growth. Clipping grasses to a height of two inches caused the grasses to lose from 15 to 75 per cent of their roots while unclipped lost less than 3 per cent.

SYSTEMATIC

G. W. Martin challenges the view of Thom and Raper who wrote *Manual of Aspergilli,* in which they suggested that the generii name *Aspergillus* should apply not only to the conidial stage but also to the ascosporii stage. Martin claims this would disregard the rules of nomenclature.

Up to 1939 the production of agar-agar was exclusively a Japanese monopoly; therefore, the development of an agar industry in India should be encouraged since the Chilka weed, *Gracilaria lichenoides,* has a richer agar content than most of those in Japanese waters. This view was expressed by an Indian worker.

This section covers Paleobotany, Algae, Fungi, Bryophytes and Pteridophytes, in addition to Spermatophytes. Hundreds of papers were presented describing almost as many new species from all corners of the earth.

MORPHOLOGY AND ANATOMY

The Russian, Alesksandrov, is of the opinion that maize fruit is more of a millet than a caryopsis and bases his conclusion on the fact that the atropous ovule of maize later becomes camylotropous and also that in the ovules of Hordeae the placentochalazal region assumes a lateral position during fruit development, and this growth pattern is associated with the formation of a groove in the caryopsis; in the maize fruit the placentochalazal region remains at the base of the fruit and no groove is formed. Other differences including development of nucellus, behavior of antipodals, and vascular bundle arrangement suggests that, whereas the typical caryopsis is a tricarpellary fruit, the maize fruit is derived from one carpel.

Miller and Wetmore described the development of the embryo of *Phlox drummondii*. Sections of the early proembryos show an axial symmetry and a cellular homogeneity. Pantulu worked out the embryology of seven species of *Cassia* and found them anatropous with a slight tendency toward amphitropy. The normal 8-nucleate embryo sac is found in all of the species. In a later paper the authors described the seedling development of the same plant and noted a particularly high transition region. A third paper described the developing shoot apex. They noted that the vegetative shoot apex had a tunica of 1-2 layers while the floral apex possessed 3-4 layers.

Esau described the morphology and reproduction in guayule. Complete data on the study of apomixis in Parthenium were included. Reproduction was studied in 36, 54, 72, and 108 chromosome types of three different species of *Parthenium*.

PHYSIOLOGY—WATER RELATIONS

Henrici noted the effect of wilting on the direct assimilates of lucerne and other fodder plants. In each of six species investigated, starch disappeared during wilting. The leaves wilted before the stem, which accumulated starch. Sucrose increased for two days before wilting set in, then fell, and reducing sugars increased. Some starch was always present. The amount of sugars found after wilting did not correspond to the lost starch. Respiration continued strongly after wilting, then fell off but increased again before death.

Kramer reported on the absorption of water through suberized roots of trees. Measurable absorption occurred through all roots studied. Comparison of rates of water movement through segments of pine and dogwood roots indicate that dogwood roots are much more permeable to water than pine roots.

Absorption of water through suberized roots may be of considerable importance, especially in evergreens, at times when the soil is too cold or too dry for root elongation to occur and few or no unsuberized root tips exist.

Raleigh reviewed evidence showing that silicon is essential for the growth of at least several plants. Spraying foliage with solutions of K_2SiO_3 did not alleviate deficiency symptoms, however.

MINERAL NUTRITION

Hewitt described very extensive experiments made on vegetables, grains and clovers, using sand cultures and withholding, in his many experiments, a number of the major elements and some of the minor trace elements. Nicholas reported on the application of rapid chemical tests to plant tissues in the diagnosis of deficiencies of mineral nutrients. The tissue tests are considered valuable for diagnostic purposes; however, the time for sampling, effect of interfering substances on tissue extraction, and establishment of nutrient standards for various types of plants must still be worked out.

Bledsoe, Harris, and Tisdale described leafspot of peanut associated with magnesium deficiency. The symptoms first appeared on the terminal leaves and later progressed to the older leaves.

The effect of various ions on guttation of the tomato was studied by Raleigh. Tomatoes were grown in solutions lacking nitrogen, phosphorous, potassium calcium, and magnesium until deficiency symptoms developed. Then when the plants were supplied with nitrogen, phosphorous and potassium and the plants were kept in a room with a relative humidity of 94 per cent, marked guttation occurred. Guttation did not occur on the plants in the deficient solutions or on those in solutions supplied with calcium or magnesium.

Albrecht found that sweet clover thrived better on 10-mesh limestone. than on either 100-mesh or pulverized, indicating that slow deterioration of the limestone was better than much readily available. Rangnekar reported that vitamin C increased with an increase of manganese up to a certain point, beyond which the manganese became increasingly harmful. Carotene seemed to be uninfluenced by $MnSO_4$ treatment.

Hoagland indicates from his investigations that molybdenum is an essential element for the growth of higher plants. Reference is also made as to the possible role of molybdenum in the symbiotic fixation of nitrogen by leguminous plants.

RESPIRATION, FERMENTATION

Biale investigated the effects of oxygen on carbon dioxide evolution in Fuerte Avocados. The rate of oxygen absorption by the fruit was studied at 15°C under 2.5, 5, and 10 per cent oxygen and in air. It was observed to follow closely the rate of carbon dioxide production with some tendency for a higher R.Q. at low oxygen tension. The effects of oxygen tension on respiration were markedly modified by temperature changes.

Lal and Srivastava noted that, irrespective of the portion from which a set was selected for measurement of respiration rate, the intensity of carbon dioxide output declined with each successive increase in age of tillers of sugar cane. Younger tillers were physiologically more active than the old and mature canes. Variations in respiration rate were found to be related to fluctuations in glucose more than sucrose, particularly in tillers of the older group.

Experiments by Lindahl and Lindberg show that inorganic pyrophosphate may be accumulated under certain conditions in baker's yeast.

PHOTOSYNTHESIS, PIGMENTS

Richter, Sukhorukov, and Ostapenke, in experimenting with ten plant species belonging to five families, came to the conclusion that the initial stages of photosynthesis, the assimilation of carbon dioxide, and the elimination of oxygen in a leaf are independent of the developmental stage of the plant, nor was there any correlation in these respects between the leaf and the reproductive organs of the plant. They furthermore reported in a later paper that photosynthesis proceeds independently of growth processes and of the distribution of organic matter within the plant.

W. E. Foster investigated the supposed presence of formaldehyde-polymerizing enzymes in green leaves. Experiments show that production of reducing sugar by autolyzing leaf-tissues is not accelerated by adding formaldehyde to the systems. The evidence lends no support to the view of Bodnar that green leaves may contain an enzyme capable of polymerizing formaldehyde to reducing sugar.

GROWTH, REPRODUCTION

Measurements made by Cormack of immature and fully grown epidermal cells show that a cell continues to grow in length after a papilla begins to push out, and that more rapid growth occurs in the apical end of the cell than in the basal end. Morel isolated tissues of young shoots of grapevine and grew them in vitro. The shoots showed a marked degree of polarity and grew quite readily. They behaved more like herbaceous plants in such a medium than woody plants. Loo cultivated excised dodder (*Cuscuta Campestris*) stem tips in vitro in light for a period of five months through many transfers. The excised stem tips produced lateral buds and flowers without the formation of leaves and roots. This is probably the first case where floral organs have developed on excised stem tips in vitro. The chlorophyll produced in the excised stem tips of dodder seems to play an important part in maintaining the growth of the culture. In Argentina, Burgos came to the conclusion that the quality of the potato tuber is primarily dependent upon climate. A cool climate where insect vectors of virus diseases are less abundant is most beneficial.

Cube (*Lonchocarpus utilis*), a native rotenone-bearing plant of South America, has been grown as a fish poison for centuries by the native Indians. It has never been known to flower and has been propagated from cuttings by the Indians. Attempts to induce flowering experimentally at Tingo Maria revealed that girdling the main branches of Cube plants in May induces flowering in September. This is a practical field method which should prove a great aid to both genetical and taxonomic studies with Cube. This work was done in Peru at the agricultural experiment station and reported by Cooper, U. S. Department of Agriculture.

GROWTH SUBSTANCES

Various plant hormones were used in numerous experiments on plants and fungi, and the extraction of auxins from plants grown under many different nutrient conditions contributed much of the experimental work in this field. The new weed killer, 2,4-dichlorophenoxyacetic acid, was also being studied extensively to note its effect in varying concentrations of different plants under different controlled conditions. The literature indicates that it is very effective on most dicotyledonous plants but with monocotyledonous plants it may be an effective weed killer only in higher concentrations.

RADIATION EFFECTS

Scully, Parker, and Borthwick described the interaction of nitrogen nutrition and photoperiod as expressed in bulbing and flower stalk development of onion. Plants grown on a photoperiod at or near that critical for bulb formation exhibited the greatest bulb development with the lowest nitrogen concentration and the least with the highest concentration. Onion plants were grown from seed to seed without an intervening dormant bulb stage by controlling the photoperiod and concentration of nitrogen available for growth.

Effect of x-rays on vetch was noted, and other experiments showing the action of x-rays on the cytoplasm of vegetative plant cells were carried out. As yet no scientific reports have been made on the effect of atomic radiation on plants in Japan or in any of the experimental areas in the United States. Such studies are now in progress, and the effect of atomic radiation on plants, which did not prove lethal, may soon be reported.

OSMOSIS, PERMEABILITY

Osterhout demonstrated the effects of hydroxyl on negative and positive cells of *Nitella*. Potassium hydroxide was particularly effective while sodium hydroxide was less effective in transforming a negative cell to positive and *vice versa*. Furthermore, part of a cell may be changed to positive while the remainder of the cell continues negative. According to Osterhout, this shows that the protoplasmic surface can not be a pure system; "for in such a system all cations must have greater mobilities than all anions or *vice versa*."

GERMINATION, DORMANCY

Denny described a method for treating dormant gladiolus cormels to increase germination. He stored the cormels over winter at 5°C to 10°C, then 10 to 20 days before planting, treated them with 40 per cent ethylene chlorohydrin at the rate of one pint per 80 pounds of cormels. Barton and Gorman reported on the effect of age and storage condition of seeds on the yields of certain plants. Age reduced the percentage of germination, but in most cases the plants which germinated from old seeds were just as good at those kept a normal period and in some cases flowered earlier.

In the few cases where inferior plants developed it was found to be the result of storage conditions rather than age.

METABOLISM, DIFFERENTIATION

Determination of the freezing point of sap from peel and pulp of citrus fruit was investigated by Shiftan, who found that cold readily penetrated the fruit; at —4°C ice is formed, and the fruit is injured. Within the crown of the tree, the temperature may be 1°C higher than outside it on calm nights, and injury to fruit growing in this position is less likely.

Lundegardh maintains that data obtained from studies of bioelectric potentials are still consistent with the view that the surface of a root is a mosaic of positive and electric valences which become saturated hydrogen and hydroxyl ions when the medium is pure water.

TRANSLOCATION, STORAGE

Work by Meyer on the use of tagged atoms, radioactive or otherwise, has confirmed the accepted views that the xylem is the path of the ascent of minerals and that the phloem is the path of translocation of food. Carbon dioxide used in photosynthesis was found to appear next as carboxyl groups attached to molecules of high molecular weight.

TOXICITY

The effects of 2,4-dichlorophenoxyacetic acid on bindweed and sow thistle were observed by several workers at the New York Agricultural Experiment Station. Leaves were plasmolyzed first with the toxin eventually traveling to the roots, although in bindweed this movement was extremely slow.

Other substances studied by various workers included adrenaline, cyanic acid, and DDT. A study by Pulvertaft of London revealed that pollen grains show the same order of sensitivity to antiseptics as bacteria; but their sensitivity to penicillin is negligible and of the same order as vertebrate cells in tissue culture.

ECONOMIC BOTANY

CRESTED WHEAT GRASS

The history of crested wheat grass in America illustrates how the value of a potentially important plant introduction may remain unrecognized for a considerable period (*Journal of American Society of Agronomy,* 1946). Seed of this grass was first introduced into the United States from Russia in 1898. However, its special adaptability to the northern Great Plains area was not fully appreciated until after 1930, when many wheat fields that had been abandoned because of the drought of the middle thirties were being seeded to grass. Crested wheat grass proved to be the only grass available which possessed sufficient drought resistance and winter hardiness for successful establishment of sod.

WHEAT

One of the greatest hazards to wheat growing in the winter wheat region is the hessian fly. Although some degree of control is obtained by planting the wheat late in the fall, the most satisfactory method of controlling the fly appears to be the development of resistant varieties. In 1935 a high degree of resistance was discovered in several spring sown wheats. This resistance has now been transferred successfully to cold, hardy, soft red winter wheat types which are in the process of evaluation to determine their suitability (*Journal American Society of Agronomy,* 1946).

OATS

For almost 100 years it has been a commonly accepted opinion that the common wild white oat, *Avena fatua,* is the progenitor of the cultivated oat varieties belonging to the species *Avena sativa.* However, evidence accumulated in recent years suggests that cultivated oats may have been derived instead from the wild red oat species, *A. sterilis* (*Journal of American Society of Agronomy,* 1946). Evidence from the fields of Cytology and Genetics, Morphology and Histology, Plant Pathology, Physiology, and Phytogeography is more compatible with the theory that the cultivated oat species *A. sativa* was derived from *A. sterilis* than with the *A. fatua* origin of our cultivated oats. Practically all of the genes for resistance to the major oat diseases of the United States can be traced directly or indirectly to *A. sterilis* as a source.

In 1946, what is apparently a new species of the *Helminthosporium* fungus caused widespread damage in oats in the United States (*Phytopathology,* 36:406 and 407, 1946). The disease was reported as causing appreciable damage on oats throughout the eastern half of the United States. The new crown rust resistant varieties of oats which derived their crown rust resistance from the Victoria variety, such as Tama, Vicland, and Boone, proved particularly susceptible. Damage may be caused to all parts of the plant—roots, crown, stems, leaves and grain. The fungus has been referred to most frequently as *Helminthosporium "96,"* although it has recently been described and assigned the name *Helminthosporium victoriae.* A 50 per cent reduction in yield from the disease was obtained in tests conducted in Iowa. An encouraging degree of resistance was found in several new varieties of oats.

Crop rotation practices in the northern Great Plains influence considerably the activity of root rotting fungi of small grains and grasses (*Phytopathology,* 36:410-411, 1946). Several years of continuous fallow reduced greatly the damage from these organisms, while one year of fallow did not affect injury appreciably. Barnyard manure and green manure crops reduced root rot damage only during years of abundant precipitation. The use of grasses in long-term rotations reduced the incidence of root rotting on the small grain in the rotation, provided some crop other than a small grain followed the grass.

ALFALFA

Insects, particularly Lygus bugs, cause enormous reductions in the seed yields of alfalfa in the western alfalfa seed production area. The use of DDT offers considerable promise as an economical means of controlling these insects. Applications of 10 per cent DDT in Utah have increased seed yields by 50 per cent (*Journal of American Society of Agronomy,* 1946).

PASTURE RESEARCH

The organization, research program, and 10 years of progress of the U. S. Regional Pasture Research Laboratory have been described in *Miscellaneous Publication No. 590* of the U. S. Department of Agriculture. The Laboratory was established at State College, Pa., in 1936 under the Bankhead-Jones Act, to undertake "An Intensive and Fundamental Study of Pasture Improvement." The region which the Laboratory serves includes Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Delaware, Maryland, and West Virginia. The work of the Laboratory is divided into (1) establishment, fertilization, and management of pastures; (2) chemical problems in pasture research; (3) breeding new varieties of grasses and legumes; (4) plant disease problems of grasslands.

Kentucky bluegrass and white clover have probably constituted the predominant species in better permanent pastures in the northeastern region. One of the management problems consists of maintaining an adequate stand of white clover. Top-dressing of permanent pastures with lime, phosphorus and potash, and frequent grazing has been effective in increasing yields and aids in maintaining satisfactory stands of clover. In spite of this improvement, however, Kentucky bluegrass does not provide adequate forage during midsummer. Consequently, much of the research has been turned to the larger grasses and legumes, of which orchard grass, brome grass, Ladino clover and alfalfa seem to be the most promising. Other species that show promise include reed canary grass, tall oat grass, tall fescue, and birdsfoot trefoil. These larger species make better growth during midsummer and produce a greater total amount of herbage than Kentucky bluegrass. A mixture of orchard grass and Ladino clover seems particularly promising.

In the breeding work at the Laboratory, attention is being given primarily to orchard grass, brome grass, Ladino clover and alfalfa. Important characteristics being sought in new strains include winter hardiness, resistance to important diseases, tolerance to drought and flooding, and ability to withstand occasional periods of too little or too heavy grazing. In conducting the breeding program, material is collected from areas including the northeastern region. The collected material is planted as individual spaced plants in source nurseries of as many as 10,000 plants. A small percentage of selected plants are increased vegetatively to produce clones. A progeny test is obtained for each of the superior clones. After considering all records, a small number of the best clones are combined to synthesize new strains. Some degree of inbreeding is being practiced with all of the species under investigation. An extensive hybridization program is in progress with orchard grass, alfalfa, Ladino clover, and meadow fescue.

Plant disease research includes snow mold of grasses, stripe smut of grasses, leaf spot of orchard grass, crown rust and net blotch of meadow fescue, wilt and leaf spot diseases of alfalfa, and leaf spot of Ladino clover.

HYBRID VIGOR

The story of the role of hybrid vigor in increasing corn production is well known. A remarkable development occurred in this phase of plant improvement during the 1930's with the result that more than 90 per cent of the acreage of corn in the Corn Belt is being planted to hybrids. The phenomenon of hybrid vigor—the tendency for the first generation of a hybrid resulting from the crossing of certain combinations of lines to exceed the parents in vigor—is now being utilized in the improvement of other plants. High-yielding hybrid onions, tomatoes, and cucurbits have passed through the research phase and are being grown commercially on a limited scale.

WEED CONTROL

In spite of expensive control measures being practiced, weeds continue to extract an enormous toll in our agricultural economy through reduction in yield of economic plants. Consequently, a continuous search is in progress to find selective weed killers, effective against a wide variety of weeds, which cause little or no damage to economic plants. The chemical 2,4-dichlorophenoxyacetic acid, commonly known as 2,4-D, is the most promising found to date for the control of many broad-leaved weed plants. Most narrow-leaved plants appear to be injured only slightly or not at all by the concentrations required to kill broad-leaved weeds. 2,4-D has been effective against dandelion, plantain, pennywort, Japanese honeysuckle, false strawberry, annual morning glory, daisy, winter cress, wild mustard, chickweed, pokeweed, curled dock, ragweed, pigweed, burdock, Frenchweed, wild lettuce, and annual sow thistle. It destroys the leaves of such perennial weeds as bindweed, Canada thistle, leafy spurge, and perennial sow thistle, but whether the roots will also be killed ultimately has not been determined. Such woody plants as chokecherry, poison ivy, sumac, honeysuckle, hawthorn, and elder have been killed also by application of 2,4-D as a foliage spray.

On the other hand, spraying of tomato plants being grown in greenhouses with very low concentrations of 2,4-D has been found to be of value in obtaining maximum fruit setting.

In the report of The Policy Committee on New Herbicides of the North Central Weed Control Conference at the 1946 meeting, the following statements were made regarding 2,4-D: "Two years of research have proven 2,4-D preparations to be valuable herbicides—useful tools in the unending fight against weeds. They may be advantageously used: (a) To control broad-leaved weeds in lawns and turfed areas generally. (Caution is required on bent grass and buffalo grass lawns.) (b) To control and perhaps ultimately eradicate a large variety of broad-leaved weeds and many woody plants from ditch banks, right-of-way, fence rows, stony areas, and many other areas which it is not possible or desirable to plow. (c) For spot treatment of susceptible perennial weeds in pastures, or to control susceptible annual and perennial weeds in pastures where legumes are not an important component. (d) To reduce vigor and begin the eradication of susceptible perennial weeds, either alone or in tolerant growing crops. (e) To control many annual weeds, either alone or in tolerant growing crops."

It was emphasized that treatment of most weedy areas is necessary for complete control. One of the chief advantages of 2,4-D is that broad-leaved weeds may be controlled in grassed areas without injury to the desirable grasses. A 0.1 per cent solution of 2,4-D acid or its equivalent is considered the standard concentration. Application may be as a dust or concentrated spray. Seedlings, or plants in active growth have generally been more susceptible than mature or dormant stages. "Low temperatures (40° to 60° F) slow up the speed of action more than they reduce the final effect of 2,4-D. The early warnings against treating at temperatures below 60° F were much too drastic."

Leaching and decomposition generally will remove 2,4-D from the soil in a comparatively short time. No injury to livestock has resulted from standard treatment with 2,4-D.

POTATO

Four new varieties of potatoes were introduced in 1946 (*The American Potato Journal,* 23:315-329 and 343-347, 1946). The Calrose variety is important principally for its moderate resistance to late blight. It appears to be well adapted to environmental conditions in California. Three new scab-resistant varieties named Ontario, Cayuga, and Seneca have been developed through cooperative research of the U. S. Department of Agriculture and the New York Experimental Station. These varieties are highly resistant to scab, somewhat resistant to wilt, and compare favorably in yield with commonly grown commercial varieties.

Preliminary results indicate that DDT gives effective control of the major foliage-feeding insects of potatoes with phenomenal increases in yields reported from its use. Gains in yield as great as 150 per cent have been reported (*American Potato Journal,* 23, 1946).

TOMATO

One of the most destructive diseases of economic plants in 1946 was late blight of tomatoes. The disease caused serious losses in practically all of the important tomato-growing areas east of the Mississippi River. It has been estimated that tomato growers in the United States suffered a loss of $40,000,000 from late blight in 1946.

The disease is apparently caused by the same fungus which produced the destructive late blight epidemics of potatoes in Ireland with the resultant famine during the middle of the nineteenth century. However, it seems probable that the tomato losses in 1946 were the result of a new strain of the fungus which is especially virulent on tomatoes. Periodic spraying of the foliage with an insoluble copper fungicide gave effective control in tests in 1946.

SWEET POTATO

Soil rot of the sweet potato was observed first in serious form in 1934, occurring in small isolated areas in Louisiana. At present the disease is widespread in several parts of the United States (*Phytopathology* 36: 869-75, 1946). The causal organism, *Actinomyces ipomoea,* is unimportant in soils having a pH reading of 5.0 or less. By applying sulphur at rates of 500 to 800 lbs. per acre to Louisiana soils, where the disease is most serious, it has been possible to lower the pH to 5.0 for a period of four to six years. Losses have been practically eliminated by this application of sulphur with increases of 120 to 160 crates per acre. The disease causes more damage during dry seasons than in wet seasons.

PHYSIOLOGIC SPECIALIZATION IN PLANT PATHOGENS

One of the most efficient methods of controlling diseases of economic plants is the development of varieties of plants resistant to disease. Work toward this end has been in progress for many years with very favorable results for most of the serious diseases of crop plants. However, this is made a never-ending task through the variability of the parasitic organisms which cause plant diseases. Varieties which are resistant at the time of their introduction may not remain resistant indefinitely. Numerous instances have been observed in which new strains of a fungus capable of attacking a hitherto resistant variety develop and increase to an extent sufficient to render that variety susceptible. Such an instance was reported for rice (*Phytopathology* 36:950-952, 1946). The rice variety Rexora, the most important high-quality, long-grained variety of rice grown in the United States, has been resistant to all known races of the fungus, *Cercospora oryzae*. However, Rexora has proved susceptible to the disease in the last two years. Isolations of the fungus from diseased material of Rexora revealed a new strain of *Cercospora oryzae* to which Rexora is susceptible.

In a lecture delivered to several chapters of the Society of Sigma Xi (summarized in *Journal of Heredity,* 1946), Stakman elaborated on the tendency of plant pathogens to change in their ability to infect host plants and consequently assuring no rest for the plant breeder. The wheat variety and disease history in the spring wheat area of the United States illustrates effectively the role which diseases play in agriculture. About 1910, the principal spring wheat varieties were Preston, Haynes Bluestem, and Glyndon Fife. Stem rust and stinking smut were major diseases on these varieties while scab, loose smut, and leaf rust were relatively unimportant. With the replacement of these varieties by the Marquis variety, the scab disease was raised from a minor wheat disease to the rank of a major disease through the extreme susceptibility of this new variety. Marquis was somewhat resistant to stinking smut and early enough to escape serious damage from stem rust, so that the importance of these diseases diminished temporarily. However, in the devastating stem rust epidemic of 1916, Marquis was damaged so severely that many farmers refused to grow it again.

Farmers who continued to grow wheat shifted to durum varieties, and for several years the durums seemed to have eliminated the old disease hazards, but root rots and ergot, previously rare diseases of wheat, soon made the growing of durums a risky enterprise.

The first stem rust resistant bread wheats, such as Kota and Ceres, came into production in the 1920's and "shuffled" the ranks of diseases once more. Stinking smut again became prevalent; loose smut and leaf rust became destructive diseases. Finally, the popular and hitherto stem rust resistant variety Ceres was ruined by stem rust in 1935. It was largely replaced by the new variety Thatcher, which was more resistant to stem rust, stinking and loose smuts, but was very susceptible to scab and leaf rust. Thatcher has now been replaced by newer varieties with better combinations of resistance to various wheat diseases.

In spite of this rather pessimistic aspect of changing pathogens, reducing the value of new improved varieties, there has been constant progress in reducing total losses, so that risks from diseases are not as great as they were 35 years ago.

As an example of the extreme variability of fungi, more than 200 parasitic races of stem rust of wheat have been found since 1916. These arise largely through hybridization between existing races on the barberry plant, the plant on which the sexual stage of the rust fungus develops.

PLANT PATENTS

Since the plant patent act became law in 1930, 612 plant patents have been issued (*Journal of Heredity*, 1946). Since the act only permits patenting of vegetatively propagated plants, its application is limited rather largely to certain horticultural plants, particularly ornamental plants. Almost half of the patents granted (299) were for roses, and 151 patents were issued for other flowers. The 612 plant patents issued during this period represent less than one-tenth of one per cent of the total patents issued, suggesting that the patent law is not sufficiently broad to perform the services for which it was intended

DIVISION XXIII

MEDICAL SCIENCES

MEDICINE, PATHOLOGY, PHYSIOLOGY

By Hamilton Southworth
College of Physicians and Surgeons, Columbia University

GENERAL

In the medical sciences, the year 1946 witnessed the reconversion of teaching and research institutions to a more normal peacetime status. About 40,000 doctors from the services were reabsorbed into the peacetime ranks of physicians and had to readjust to civilian life. Research programs were reorganized to make room for the returning workers. At the same time, the extensive Federal support of medical research, through the Committee on Medical Research of the Office of Scientific Research and Development, came to an end, and budgetary readjustment was required in almost all of the leading institutions.

The release of wartime censorship, first felt in 1945, led to further publication of significant work hitherto known only to a few workers in each specific field. Some of this material emanated from civilian laboratories and some cleared through military channels and represented clinical experience from the field. For the first time it was possible to coordinate a number of subjects and to discuss them freely at medical meetings.

The particular emphasis on chemotherapy, commented on in 1945, became if anything still more pronounced, with streptomycin accepted as a close rival of penicillin in the field of antibiotics, and with the clinical trial of several substances that received pharmacological and toxicological study during the war. In particular, the universal concern over the advent of atomic power focussed attention on radioactivity and its various physiological effects.

STREPTOMYCIN

The efficacy of penicillin is largely confined to those bacteria which take a Gram stain and are therefore known as Gram positive organisms. To combat the other great category of bacterial infections, those due to Gram negative organisms, by far the most promising material for other than local use is streptomycin, an antibiotic derived from Actinomyces griseus. In fact, it appears that this newer agent will control some of the Gram negative infections as dramatically as penicillin handles gonorrhea. The material is being manufactured in sufficient quantities so that experimental needs have been satisfied, and some can be secured for appropriate cases in general practice through distributing centers in the large hospitals. The cost, however, is still such as to justify its use only in seriously ill patients.

At a meeting under the auspices of the National Research Council, it was decided to measure streptomycin in terms of the metric weight of the pure substance. By coincidence, it was found that one microgram had an activity almost identical with one S unit as originally described by Waksman. One gram of streptomycin, as now ordered, is therefore equivalent to 1,000,000 S units. Three crystalline salts of streptomycin have now been prepared, and though the structural formula is as yet unknown, it is generally agreed that the material is $C_{21}H_{39}N_7O_{12}$.

Absorption of streptomycin from the intestinal tract is very slight, and the agent is therefore administered parenterally, generally by intramuscular injection in divided doses every three hours. Total daily dosage varies from 750 mg. to 4 gm. As the agent is more active at a high pH, preliminary and coincidental alkalinization is indicated in the treatment of urinary infections. Resistance to streptomycin has been observed to develop very rapidly both *in vitro* and *in vivo* so that high initial doses seem advisable. Unless the urgency is extreme, it is always wise to test the sensitivity of the organism before commencing treatment. Dosage can thus be guided to a certain extent and futile administration often avoided. It has been suggested that the very rapid development of resistance is due to the selective growth of resistant mutants. rather than to an alteration in the enzymatic activity of the strain as a whole.

Clinical applications can be summarized as follows:

(1) *Urinary tract infections* due to Gram negative organisms resistant to sulfonamides can be cured at least four times out of 10. Dosage in the majority of the 400 cases reported was 1.0 to 2.0 gm. daily for 5-7 days, and results were best in the few cases in which the urine was kept alkaline (pH of 7 or more). Coincidental surgery was often required for good results.

(2) *Meningitis due to the Influenza Bacillus* has responded better to streptomycin than to any other agent, and so have other severe infections due to this organism. Of the meningitis cases which are particularly common in young children, 2 out of 3 were cured. Intraspinal as well as intramuscular injections were used.

(3) *Tularemia,* an acute febrile disease usually contracted from wild rabbits but occasionally from ticks, flies, and the bites of other animals, formerly ran a course of 2-3 weeks and if pulmonary involvement developed, had a mortality of 40 per cent. Now the small Gram negative bacillus which causes it, has been shown to be sensitive to streptomycin, and 55 out of 67 treated cases have shown an immediate and striking improvement when the antibiotic was started.

(4) *Pneumonia due to Friedlander's bacillus* seems to have been benefited by streptomycin. Of 17 cases treated, 6 recovered and 3 improved permanently. There is suggestive evidence that acute cases caught in the early stages before necrosis develops respond very well.

(5) *Bacteremia or Peritonitis due to Gram negative organisms* may be favorably influenced by streptomycin, and certainly this agent seems to be the antibiotic of choice in these conditions. The response is dependent on the sensitiveness of the bacteria involved and on the local lesion through which the organisms made their entrance.

(6) *Tuberculosis* has at times been favorably influenced by streptomycin in doses of 2.0 to 4.0 gm. daily. A few patients with miliary tuberculosis and a few with tuberculous meningitis have shown striking temporary improvement, but nearly all have later succumbed to their underlying disease. Pulmonary tuberculosis of the exudative type has also shown some palliative effect, while more chronic cases with caseation have proved resistant. Streptomycin appears to be the most active chemotherapeutic agent so far described in clinical tuberculosis, but its effect is bacteriostatic rather than curative, and administration must be continued for months at a time. Final evaluation must await the results of prolonged studies and will probably depend on whether it will prove possible to continue the palliative effect of streptomycin over a period of a year or more without interfering with the natural development of immunity.

Streptomycin is not a non-toxic agent. In spite of the best efforts to date towards purification, histamine-like effects, such as headache, flushing, and vomiting, still occur, though with diminishing frequency. Sensitization develops in about 5 per cent of cases and is characterized by fever and skin eruptions of various types. The most disturbing toxic effects, however, have been tinnitus, vertigo, and deafness, which appear as late manifestations after the prolonged administration of large doses. With continued use of the compound, the symptoms generally decrease in severity, but there is some evidence that this is due to compensation rather than to restoration of function. Clinical symptoms are not common, but it has been reported that subclinical impairment is frequent after several weeks of large doses.

Until more is known of this toxic effect on the 8th cranial nerve, streptomycin should be reserved for those infections that are truly dangerous and are caused by organisms which are susceptible to its action.

ANTIMALARIALS

In spite of over twenty years of research in Germany and intensive efforts both in England and the United States during the war, no ideal antimalarial drug has been discovered. Data on three valuable new agents have recently been released. Inasmuch as malaria is reputed to cause a million deaths a year, these compounds are of real importance.

(1) *Chloroquine:* 7-chloro-4-(4-diethylamino-1-methylbutylamino)-quinoline, first mentioned in 1945 as SN-7618, has now been officially designated as chloroquine. Extensive studies indicate that, though its action is essentially similar to that of quinacrine (atabrine), it possesses definite advantages over that compound. In the suppression of vivax and falciparum infections, the effective plasma level is so low that with the nearly complete absorption and slow degradation of the compound, it is possible to achieve satisfactory results by giving a single tablet of 0.3 gm. once a week, instead of the daily 0.1 gm. found advisable with quinacrine. Furthermore, the compound is colorless, and no yellow staining of the skin occurs. In the therapy of acute attacks, it is only necessary to give 4 doses (totaling 1.5 gms.) over the course of 3-4 days. This will eradicate infection due to falciparum malaria, and though it does not significantly reduce the incidence of relapses due to vivax malaria, the average interval before the relapse occurs is longer than that with quinacrine. Toxic effects are similar to those with quinacrine but at the dosages used seem to be less frequent.

(2) *Pentaquine:* The great weaknesses of quinacrine and chloroquine are (a) that suppressive doses do not prevent the later development of vivax malaria, and (b) that after treatment of the acute attack of this type of malaria, the relapse rate of certain Southwest Pacific strains is as high as 70-80 per cent. Following a suggestion made before the war, British investigators found that the relapse rate could be markedly reduced by means of a two-weeks' course of treatment with pamaquine (plasmochin) 30 mg. and quinine 2.0 gm. daily. Higher doses of pamaquine, while more effective, led to serious toxicity.

Announcement has now been made of a new American compound to which the name of pentaquine has been given. Structurally related to pamaquine, it is 6-methoxy-8-(5-isopropylaminoamylamino)-quinoline. At therapeutic doses, however, it is only 50-75 per cent as toxic as pamaquine to man. Severe anemia has only been encountered in 1 of 171 white subjects treated, and, in monkeys at least, no methemoglobinemia is produced. Some cases of postural hypotension and of drug fever have been reported.

Pentaquine is too toxic to be recommended in the suppression and prophylaxis of malaria, and its effect in preventing relapses is incomplete when used alone. A daily dose, however, of 60 mg. of the base and of 2 gm. of quinine administered concurrently in divided doses every 4 hours for 14 days is sufficient to produce radical cure of severe infections due to P. vivax. In 35 patients treated during their third relapse, no further attacks have occurred.

It is to be emphasized that these results are preliminary and it remains to be seen how they will stand up under field conditions both as to efficacy and as to toxicity.

(3) *Paludrine:* During the war British investigators explored a series of guanidine and biguanide compounds possessing antimalarial activity. The most promising, which is N_1-p-chlorophenyl-N_5-isopropylbiguanide, has been named paludrine. 147 cases of acute vivax malaria and 22 of falciparum malaria have been treated with doses ranging from 10 to 700 mg. every 12 hours for 14 to 28 days with clinical cure of a promptitude comparable to that with the standard course of quinacrine. Vomiting, diarrhea, abdominal pain and occasional red blood cells and hyaline casts in the urine may appear as transient toxic effects with dosages of 1.0 gm. a day. A report from Australia, however, indicates that relapses of the vivax infection subsequently appear, though probably not as frequently as with quinacrine.

More significant, however, are the tests of causal prophylaxis which indicate that daily doses of 300 mg. prevented the subsequent development not only of falciparum malaria but of 5 out of 6 cases of vivax malaria. Moreover, with smaller doses there was evidence that the drug acted on the early forms of the parasite so that invasion of the red blood cells did not occur, while quinacrine only destroyed the red blood cell forms as they developed. 0.1 gm. of paludrine twice a week has been found to be effective as a suppressive for vivax infection and to act as a complete causal prophylactic for falciparum ones.

Indications are that paludrine will be inexpensive to manufacture. If Australian results are confirmed, it may prove the best of the antimalarials. Such cases of vivax infection as escape its prophylactic action may be kept under control by occasional doses of paludrine or may be eradicated by a course of quinine combined with an 8-aminoquinoline such as pentaquine.

FOLIC ACID

The new antianemic factor originally described under such various names as L. casei factor, Vitamin M, Vitamin B_c, and Folic Acid, has now been made commercially available as synthetic Folic Acid. Structurally it is a complicated molecule containing glutamic acid, a benzoyl group, and the pteridyl ring. It is generally accepted as a member of the vitamin B complex, and accumulating evidence indicates that it is effective in macrocytic anemias whether due to pernicious anemia, sprue, liver disease or faulty dietary.

The blood count in pernicious anemia responds as well to folic acid as to the intramuscular injection of liver extract. The material can be taken in tablet form by mouth and is quite without toxic effects in the doses of 5-20 mg. daily which have proved adequate. Besides the reticulocyte response and the rise in red blood count, patients have a dramatic increase in vigor, and such other disease manifestations as sore tongue and intestinal symptoms disappear. Whether there is improvement in the neurological manifestations of pernicious anemia is still not settled, but the evidence to date suggests that in this one respect folic acid is inferior to liver extract.

Sprue, whether of tropical or nontropical origin, also responds to folic acid in doses of 15 mg. or more daily. The macrocytic anemia, fatty diarrhea, and weakness are relieved, and the patients regain weight. There is some evidence, however, that the stools do not entirely return to normal and in particular that their fat content may remain high.

The mode of action of folic acid has been the subject of much speculation. It has been shown that the effectiveness of liver extract is not due to its minute folic acid content. Moreover, folic acid does not correspond with either the extrinsic or the intrinsic factor whose interaction is believed by Castle to prevent pernicious anemia. The situation has been further complicated by the discovery that 5-methyl uracil, a totally dissimilar compound which generally goes by the name of Thymine, is also effective in pernicious anemia if given orally in doses of at least 6.0 gms. daily. It is doubtful if this compound will be of practical importance, since the effective dose is 1,200 times that of folic acid. Thymine, however, is a constituent of the nucleic acid molecule. It has been suggested that folic acid may act as an enzyme in the synthesis of thymine or a thymine-like compound. It is also possible that the anti-anemic factor in liver has to do with the conjugation of folic acid within the body or its release from some stored form.

HISTAMINE COMPETITORS

For several years evidence has been accumulating to indicate that many of the manifestations of allergy are mediated by the release within the body of the substance, histamine. It was logical therefore to try to control allergic diseases by administering compounds which would block the action of histamine, presumably by competitive action. French workers discovered that certain substances containing the ethylene-diamine radical had such an action. A series of these compounds has been explored, and at the present time antergan and neoantergan seem to be the most promising. Meanwhile, in this country, two rather similar compounds were developed and given the names of benadryl and pyribenzamine.

Extensive clinical tests of benadryl and pyribenzamine have now been reported. Both compounds have been particularly effective in urticaria and angioneurotic edema. The itching is almost always relieved, and in about 80 per cent of cases the swellings are modified. Serum sickness is also benefited, except for the arthralgia, which is often unaffected. About 80 per cent of cases of atopic dermatitis have experienced relief from their itching. In hay-fever and vasomotor rhinitis, pyribenzamine is generally preferred to benadryl, with favorable effects in 65 to 80 per cent of cases. Results with asthma have been more disappointing, but there is evidence that benadryl helps about 10 per cent of cases and pyribenzamine nearly 30 per cent. In food allergy there has been some benefit but the results can not easily be quantitated.

Benadryl is administered orally in 50 mg. doses 3-4 times a day. Serious toxicity has not been reported, but about 50 per cent of patients experience some degree of drowsiness, lassitude, or dizziness. Pyribenzamine is usually commenced in similar doses, but it is often possible to administer larger doses (100-150 mg. 3-4 times a day) without side-effects. Only about 25 per cent of patients complain of toxic manifestations. Drowsiness and lassitude are the commonest symptoms, but nervousness, insomnia and dry mouth also occur.

Comparison of pyribenzamine and neoantergan has not been adequately reported as yet. In a small series of respiratory allergy cases, pyribenzamine was preferred by more patients than was neoantergan. Doses of 100-200 mg. of neoantergan were required but the side-effects were, if anything, less.

It must be emphasized that all these compounds act as histamine competitors. There is no evidence that they modify the underlying sensitivity of the patient to his allergen, and relief is afforded only during the period of administration. It is not yet known how much this temporary relief will decrease the indication for desensitization.

NITROGEN MUSTARDS

The chief, blister-producing, chemical warfare agent in the First World War was sulfur-containing mustard gas. With the advent of the Second World War, research on war gases was resumed, and a series of new agents was studied in which nitrogen was substituted for sulfur. These compounds were known as the nitrogen mustards. It was soon discovered that in addition to a local vesicant action, they had profound systemic effects especially upon the formed elements of the blood and the mucosa of the gastrointestinal tract. In general, the more rapidly cells were multiplying the greater was their susceptibility to these compounds. The toxic action was shown to be due to the formation of a cyclic onium cation.

The use of nitrogen mustards, especially of methyl-bis (B-chloroethyl) amine hydrochloride, on neoplastic disease has been reported this year. In advanced Hodgkin's disease, a favorable though temporary effect was obtained in nearly every instance when small doses were given intravenously. Cases employed were, in general, those which had previously been treated with x-ray and which were considered resistant to further irradiation. Tumor masses regressed, fever receded, and many patients experienced an improvement in appetite, weight and strength that lasted from 2 weeks to 5 months. Similar but less marked results were obtained in some cases of lymphosarcoma. It was not possible to predict which cases would be benefited, and it was noted that with successive courses the effect decreased progressively. A few cases of leukemia have also been treated, and the results so far indicate some benefit in a number of the chronic forms, but probably no more than would be obtained with roentgen irradiation. In far advanced cases the thrombocytopenia and anemia have been felt to contraindicate the use of nitrogen mustards.

The toxicity of the compounds is such that very careful observations of the blood cells, especially of the white corpuscles and platelets, are needed. If the usual fall in these elements becomes excessive, transfusion may be required, and penicillin may be advisable to ward off severe infection. In addition, the gastrointestinal symptoms, especially nausea and diarrhea, may be distressing; and thrombophlebitis at the site of injection has not been uncommon.

The use of the nitrogen mustards in inoperable carcinoma is now being explored. Preliminary results, except in a few special types, have not been encouraging, but in a field where so little of promise is available, some limited application may be found.

PHYSIOLOGICAL EFFECTS OF ATOMIC ENERGY

Research on atomic fission is still surrounded with deep secrecy, but some reports of the physiological effects have been released. The destruction wrought by the atom bombs dropped on Hiroshima and Nagasaki, where a total of 125,000 persons was killed, has been available for analysis.

Study of the Japanese victims revealed the conventional type of high-explosive injuries (air-blast injury due to flying debris or impact against fixed structures and crush injury due to the collapse of buildings). But in addition, there was an extraordinary number of radiation deaths due both to the heat of the explosion and to the instantaneous dose of short-wave and neutronic radiation which accompanied it. The heat effects were of the flash-burn type, in which exposed surfaces were charred but body areas covered with light clothing or shadowed by a wisp of hair were completely protected. Radiation effects occurring within 48 hours consisted of weakness, malaise, fever, and vomiting. The confusion of the civil services in the bombed cities prevented autopsy of the early deaths, but it is presumed that the findings would have been those of extreme radiation sickness with leukopenia and loss of adrenal lipoid. Later effects included weakness, anorexia, weight loss, diarrhea, epilation of the scalp, gonadal atrophy, and severe blood destruction.

Of the blood disturbances, the leukopenic group became apparent earliest, and most deaths occurred within three weeks with Ludwig's angina as the prominent symptom. The rapidity with which the white count fell suggested that the circulating white cells were killed as well as their marrow precursors. Next in order of occurrence were the hemorrhagic cases with a peak mortality between the 3rd and 5th weeks. Thrombocytopenia due to bone marrow damage appeared to develop as the circulating platelets were used up, and both cutaneous purpura and massive hemorrhages occurred. Bleeding times were also found to be unduly prolonged. Cases which weathered the 1st few weeks often developed, still later, a severe anemia with a red cell count of one million or less. On biopsy the marrow of such cases was sometimes aplastic and sometimes hyperplastic.

It was interesting that in the largest survey yet reported no instances were found in which persons who had entered the areas after the explosion became victims of residual radiation.

RADIOACTIVE PHOSPHORUS

Many of the new radioactive isotopes produced by nuclear bombardment in the cyclotron or elsewhere are being tested both as therapeutic agents and as tracer elements to elucidate biochemical reactions in the body. The most conspicuous therapeutic find as yet is radioactive phosphorus or P^{32}, which with a half-life of 14.3 days is converted into sulfur after emitting a beta-ray.

Having the chemical properties of phosphorus, P^{32} is taken up by those tissues having a high phosphorus content, and especially by those having the most active growth and metabolism. The high concentration initially in the circulating red and white blood cells and later in the bone marrow, lymph nodes, liver and spleen makes possible the selective radiation of these tissues.

The best therapeutic results have been reported in polycythemia vera, in which there is an idiopathic overproduction of red blood cells. Over 200 treated cases have been reported, of which 90 per cent had satisfactory remission of their disease, often lasting over two years. Since the radiation affects white cells and platelets, careful blood counts are required following the intravenous administration, but the opinion of those who have treated the greatest number of cases is that radioactive phosphorus "is probably the best therapeutic agent available at the present time for polycythemia vera."

P^{32} has also been used in the treatment of leukemia and of various neoplastic diseases. In leukemia, the results are much the same as those obtained with x-rays, but radiation sickness is negligible. Hodgkin's disease and lymphosarcoma do not respond as well as to x-rays.

CYTOCHROME-C IN TISSUE ANOXIA

Among the substances which promote tissue oxidation are the cytochromes. It is believed that their action makes possible the resynthesis of adenylpyrophosphate, which, by release of the phosphate-bond aids in the transfer of tissue energy. It has been shown in animals that additional cytochrome will prevent the diminution of tissue organic phosphates which occurs in tissue anoxia.

Experiments indicate that cytochrome-C, which can be readily prepared from beef-heart, is non-antigenic and can be injected intravenously. After severe hemorrhage in dogs, it is possible with large doses to resuscitate a number of animals which otherwise would have succumbed to irreversible shock. In human beings subjected to anoxia by breathing 10 per cent oxygen, the electrocardiographic changes which occur in susceptible individuals have been reported to be regularly prevented. Electroencephalographic changes and impairment of visual discrimination similarly produced have been overcome.

The possible role of this material in severe shock and in high altitude flying is obvious.

CURARE IN MUSCLE SPASM

Curare has long been recognized as a poison with paralytic action upon the myoneural junction. In recent years the isolation of the active principle, d-tubocurarine, in pure crystalline form, has made it possible to conduct accurate pharmacological studies of the compound. Its clinical use became feasible when it was found that intramuscular administration in a vehicle of white wax and peanut oil led to a prolonged absorption that was consistent and yet at such low levels as to avoid unpleasant side effects. It was possible to produce a partial block of the myoneural junction sufficient to prevent transmission of abnormal nerve impulses resulting from a local disease process and yet insufficient to affect voluntary muscular action.

Tubocurarine in oil and beeswax has been shown to relax muscle spasm in various orthopedic conditions. Patients with acute low-back strain almost invariably obtained relief of major pain and were able to relax and sleep without sedation. Localized pain, however, continued in the region of actual disease where it was capable of local signature and proved useful in the diagnosis of underlying pathology. Muscular soreness also persisted, presumably as the sequel of prolonged contraction and ischemia. Where the spasm and major pain were secondary to a continuing stimulus such as nerve root compression, radicular pain persisted and the reflex spasm recurred as the effects of the tubocurarine wore off. Temporary relief was thus obtained in many cases, diagnosis was aided, and in those instances where reflex spasm was perpetuated by the vicious cycle of pain and splinting, permanent relief was at times obtained.

SURGERY

By Edwin J. Pulaski
Chief, Surgical Research Unit, Brooke Army Medical Center

GENERAL

Advances in basic sciences continue as in previous years to spearhead the progress in surgery. During 1946, wartime experiences, including many developments kept secret for reasons of military security, were published and evaluated in regard to civilian practice. Some of the outstanding contributions of the year are presented here.

STREPTOMYCIN

Streptomycin, the antibiotic developed from the mold, Streptomyces griseus by Waksman and his co-workers, now appears to have a place in the treatment of certain important gram negative bacterial infections. The types of infections most influenced by streptomycin are usually unaffected by penicillin and sulfonimides. The intramuscular injection of streptomycin in suitable doses produces therapeutic concentrations of the drug in the blood. Following injection streptomycin diffuses fairly rapidly through the body and it is mobilized for excretion in the urine, and to a slight degree in the bile. Unfortunately, streptomycin is very poorly absorbed from the gastrointestinal tract, and this route of administration can not be utilized for therapy of generalized infections. The antibiotic, when taken orally, is not destroyed in the gastrointestinal tract, and a large percentage of it is excreted with the feces. It sterilizes susceptible bacteria as it is passed along.

Streptomycin may be administered locally for the treatment of infections involving the brain, meninges, ear, pleural cavity, and the open wound. The usual daily dosage of streptomycin parenterally administered for the treatment of infections is 1 to 3 grams. The usual oral dosage for the treatment of enteric infections is 2 to 4 grams. These conditions have been found to date as indications for streptomycin therapy: (1) tularemia, including the pneumonic and the glandular types, (2) acute bacillary dysentery, (3) uncomplicated gonorrhea in the male, (4) bacteriemia due to organisms sensitive to the action of streptomycin in which the focus receives concomitant, appropriate surgical management, (5) infections of the urinary tract due to susceptible organisms uncomplicated by the presence of calculi or undrained pus, (6) meningitis due to Hemophilus influenzae and other gram-negative susceptible organisms.

Limited experience suggests that streptomycin administered parenterally and by nebulization is of value in the preparation of patients for pulmonary resection. The antibiotic is very effective in the treatment of tuberculosis experimentally produced in animals. It is too early to make final statements at this time concerning the value of streptomycin in the treatment of pulmonary and extrapulmonary tuberculosis in man. Extensive trials are now being made in a few clinics. Streptomycin is of doubtful or no value in the treatment of typhoid fever, undulant fever, chronic osteomyelitis and idiopathic nonspecific ulcerative colitis. Under certain conditions organisms develop resistance to streptomycin, both in the test tube and in the body, with a speed much greater than is noted with penicillin or the sulfonamides. The degree of sensitivity of organisms to streptomycin as determined in the laboratory, can be used as an index of the probable effectiveness of the treatment of infections in the patient with streptomycin.

This drug has a low but definite toxicity. Most reactions are not serious and disappear on withdrawal of the drug. On the other hand, if treatment with streptomycin is prolonged, that is, for periods beyond 2 weeks, irreversible toxic effects on the eighth cranial nerve may occur in an occasional patient.

PENICILLIN IN BEESWAX AND PEANUT OIL

Considerable information has accumulated regarding the suspension of penicillin in beeswax-peanut oil mixtures as a practical and effective method which permits a single daily intramuscular injection of penicillin instead of the usual eight injections a day. Usually 300,000 units to 500,000 units are given. Single daily injections have been shown to be successful in the treatment of gonorrhea and in a variety of other infections. There is a trend underway to extend this single injection technique to the treatment of infections in which a very high blood level is not a requisite. The most important drawback to this method is the occasional allergic reaction in the sensitive patient to either the penicillin or the beeswax-peanut oil base. It is of importance that these reactions are transient in nature.

PENICILLIN TYPES

Recent studies have shown that commercial penicillin consists of several fractions, alphabetically labeled, which differ in activity and potency. When penicillin was first produced commercially by the surface culture method, fraction F predominated. Later when deep fermentation came into use G was the predominant type. Following changes in strains of mold and methods of production some commercial preparations contained a mixture which is F, K and G penicillins. On these latest developments, the Council on Pharmacy and Chemistry of the American Medical Association made the following report which is here reproduced.

"(1) Commercial penicillin has consisted of varying mixtures of one or more of the five known fractions, F, G, X, K and dihydro F.

"(2) Penicillin K is apparently rapidly destroyed or eliminated in the body, and therapeutic levels are not achieved or maintained in the body fluids following ordinary doses.

"(3) Commercial penicillin now available is predominantly penicillin G, which is known to be effective although some of the penicillin produced for a few months in 1945 may have had relatively less G and more K than previous or subsequent batches.

"(4) As far as facts are available, penicillins F and X are as active clinically as penicillin G. Further research will be necessary to define their usefulness with preciseness.

"(5) Since precise methods are not available for the routine determination of the quantities of each fraction in each batch of penicillin, the National Research Council has recommended increased dosage of penicillin as a safety precaution; particularly in the treatment of syphilis, in which the end result of therapy cannot be evaluated for a long time.

"(6) Although bacteria have been made resistant to penicillin in the test tube, development of clinical resistance has not become a problem. Such an eventuality may be prevented, in part, by giving adequate and not minimum doses of penicillin.

"(7) All penicillin and penicillin pharmaceuticals currently on the market have been examined and certified as to safety and efficacy by the United States Food and Drug Administration.

"(8) It is possible that natural or synthetic variations of the penicillin molecule will result in the development of a clinically better penicillin. None better than penicillin G is now available." (Enormous advances have been made in our knowledge of the chemistry of penicillin. It is impossible to predict the far reaching effects of the information derived from the cumulative efforts of this wartime research.)

Crystalline penicillin G is now commercially available, and is nearly completely free of impurities. This highly purified penicillin is reasonably thermostable in the crystalline state.

PENICILLIN THERAPY IN PERITONITIS CAUSED BY RUPTURED APPENDIX

Recent experimental and clinical studies indicate the usefulness of massive doses of penicillin as adjuvant therapy in the management of peritonitis of appendical origin. This beneficial effect is remarkable since earlier studies with usual doses of penicillin cast doubt on the efficacy of the antibiotic in mixed infections, due to the penicillin destroying action of fecal gram negative bacteria. It has now been demonstrated that massive doses of penicillin selectively inhibit the gram positive bacteria of peritonitis. This action interferes with bacterial synergism which is an important feature of peritoneal infections. The remaining gram negative bacteria may then be eliminated by the defense mechanisms of the body.

The principle of massive doses of penicillin has been applied to other ordinary intractable infections, notably subacute bacterial endocarditis. Daily doses in excess of one million units for a month or longer may be given without apparent untoward reactions or harmful effects. Additional organisms may now be added to the list of penicillin susceptible ones.

LOCAL HEMOSTATIC AGENTS

During the war years, three new local hemostatic agents were introduced. These were human blood fibrin foam and gelatin sponge, both of which are soaked in thrombin solution prior to use, and oxidized cellulose gauze which is used in the dry state. All are packed in sterile form. The three agents have two common characteristics which make them desirable for use in all fields of surgery: (1) they are effective in the control of venos and capillary hemorrhage, (2) they are absorbed by the human body, with minimal but varying degrees of foreign body reaction.

Agents of this type were developed for use in neurosurgery but their use is now extended to other fields. They are particularly valuable in the control of hemorrhage in the liver, gall bladder bed, in areas denuded by the freeing of adhesions and in control of hemorrhage in inaccessible places where it is impractical to apply sutures or ligatures. It is too early to decide which agent is superior, or to outline any specific indications for the individual materials. Gelatin sponge is said to produce less foreign body reaction than the oxidized cellulose gauze.

All are contraindicated in the presence of infection except as a lifesaving measure in the control of inaccessible hemorrhage. Even though the use of local absorbable hemostatic agents is still not fully defined, these agents have proven so valuable that they are certain to be a permanent part of the surgeon's armamentarium.

The oral use of buffered thrombin in the arrest of certain types of gastric hemorrhage has been advocated recently. Thrombin is gradually inactivated in acid solution and actually destroyed at pH 4.8. The acidity of the stomach normally would destroy thrombin before it could become effective. This problem has been met by the preliminary and concomitant administration of phosphate buffer solutions.

SECONDARY CLOSURE OF SOFT PART WOUNDS

Considerable experience was gained during the war with the secondary closure of soft tissue wounds. Equally important experience was derived from the controlled use in certain theaters with chemotherapy as an adjuvant to secondary suture of these wounds. The usual criteria for determining the suitability for closure include: (1) the vascularity of the granulating bed, (2) absence of necrotic tissue, (3) relative absence of exudate, (4) lack of edema, (5) healthy appearance of the marginal skin, (6) minimal temperature elevation. Best results were obtained when these criteria were met and secondary closure was elected at the time of removal of the first dressing. Secondary closure after two or more dressings usually required chemotherapy to prevent infection in the wound. Important conclusions derived from these studies are (1) no chemotherapy is of value in the prevention of toxemia caused by the absorption of the products of tissue decomposition which occurs in wounds not properly debrided, (2) local application of sulfonamide drugs is of no value, (3) one of the most important wound pathogens is the hemolytic streptococcus. Systemically administered sulfonamides or penicillin effectively control impending streptococcal infections of wounds. It is stressed that no method of chemotherapy can substitute for technical and surgical management of wound suppuration.

DRESSINGS FOR WOUNDS

Dressings for open wounds such as burned areas and deep surface wounds should have certain physical properties. These include a low coefficient of friction so removal without trauma is possible, a fine mesh to block growth of granulation tissues into interstices, inertness and easy sterilization. Vaseline dressings are widely employed because they have come nearest to meeting these criteria. This type of dressing has the objection of causing maceration of the tissues, and, being a foreign body, of provoking exudation. During the war experimentation with other types of dressings than vaseline brought forth at least three substitutes which meet the aforementioned criteria, yet are free of the objections of vaseline. Included are (1) parachute nylon (2) rayon and (3) fiberglass. These materials are sterilized in appropriate sizes by dry heat or autoclaving. They are placed into the wound either dry or moistened with isotonic saline and trimmed to meet the requirements. Dry dressings are placed over the dressing next to the wound. At the time of change of dressings it is usually easy to remove the entire dressing mass without trauma. In an occasional case moistening the dressing before removal is necessary. Buds of granulation tissue do not penetrate dressings of this type and hemorrhage attending the change of dressings is kept at a minimum.

THERMAL BURNS

The war experience led to the development of new techniques and concepts in the management of the severely burned patient. The local treatment of the burned area and the management of the systemic effects of this type of injury were recognized as two distinct entities requiring equal and simultaneous attention. Conspicuous in the local therapy was the abandonment of tannic acid coagulation of the burn in favor of vaseline and pressure dressings, so that skin grafting could be accomplished as early as possible. The incidence of contraction deformities has been lowered by this means. The systemic treatment has focused attention on the huge losses of protein, salt and hemoglobin and the need for their replacement.

PYRUVIC ACID METHOD IN THE LOCAL TREATMENT OF BURNS

In 1944 a report appeared on the use of pyruvic acid method of promoting the separation of slough in experimental burns in animals. The method has been applied to a limited number of extensive deep burns in patients and shows promise. The application of pyruvic acid with a pH of 1.9 in patients caused a rapid separation of the slough of a deep thermal burn without significant damage to the living tissue. The result is that the wound is immediately acceptable for extensive skin grafting regardless of what the bacterial culture shows. The ultimate objective of modern burn therapy is application of skin grafts, that is, the conversion of the open wound to the closed wound. The advocates of pyruvic burn therapy state that the method permits advancement of early closure of the wound. The 30 reported cases in most instances were grafted within 20 days after burning, a significant advancement.

ANEMIA IN THE SEVERELY BURNED PATIENT

Recent studies have thrown considerable light on the fate of the red blood cells and hemoglobin in the severely burned patient. In one such study, tagged or radioactive red blood cells were used. It was demonstrated that severely and deeply burned patients may destroy 100 to 200 cc of red blood cells per day in the first three or four days after burning. Later the patients may develop a red cell disappearance which is probably a result of the so-called acute toxic loss of protein and wound infection. In these cases occasional small blood transfusions were shown to be inadequate. A practical aspect of this study is the conclusion that replacement therapy in burn shock must be directed toward the restoration of all deficits in the circulating blood. Frequent whole blood transfusions will fill these requirements more nearly than any other single agent. Water and electrolytes can be administered to best advantage by mouth in most patients, and this is the route of choice. The repeated administration of whole blood transfusions to correct the anemia has the additional advantage of helping to restore nitrogen balance equilibrium, an important factor in wound healing.

RADIOACTIVE ISOTOPES AND NITROGEN MUSTARDS

Several interesting by-products of the chemical warfare research program show promise as diagnostic as well as therapeutic aids in medicine. Included is BAL (British Anti-lewisite) which, given early is a potent antidote for acute heavy metal poisoning, particularly mercury and arsenic. Research on poison gases resulted in the development of Nitrogen Mustards, one of which, bis (chloroethyl) methylamine hydrochloride (Dema), may find chemical application because of its toxic effects on the bone marrow. Experimental work shows that members of this chemical group have a striking arresting effect on selected cases of Hodgkins disease, lymphosarcoma, leukemia and polycythemia vera. The result is not unlike that obtained following radiation therapy. These drugs must be used with caution since the margin of safety is narrow. Optimal dosage schedules remain to be determined. Like radiation therapy, these substances do not cure.

The possibility of the use of radioactive isotopes of certain elements for the treatment of disease has been entertained for many years. Difficulty of production made the procurement and cost of such isotopes prohibitive as regards extensive clinical research. Newer methods of producing isotopes are being developed as by-products of atomic energy research. Radioactive phosphorus shows promise in the treatment of leukemia and polycythemia vera. An apparent advantage is the same effect as that obtained with x-rays but without any accompanying radiation sickness. The full possibilities of radioactive phosphorus are being explored.

Radioactive iodine is obtained by bombarding organic iodine. When administered orally, the thyroid gland does not differentiate between radioactive and non-radioactive iodine. Distribution of radioactive iodine in the body may be followed by the use of the Geiger counter. This isotype is now being evaluated as a therapeutic agent for hyperthyroidism and for cancer of the thyroid gland. The beta rays from radioactive iodine deliver within the thyroid an internal radiation which is physically similar to roentgen radiation. The scheme of therapy is not yet defined, but limited observations show radioactive iodine is indicated in hyperthyroidism when the patient is sensitive to ordinary iodine or thiouracil, or it is not a good surgical risk. (Thiouracil still remains an "experimental drug" in the treatment of toxic goiter because of potential untoward depressant action on blood forming organs. Various derivatives are being explored in search of a drug with a wider margin of safety.)

A severe case of cancer of the thyroid, with multiple metastases and thyrotoxicosis resulting from metastic tumors, was brought under complete control following administration of radioactive iodine for a period of 2 months. While this case has been followed for 3 years and no secondary ill effects have resulted, there is much work yet to be done on determination of proper dosage and determination of potential side reactions.

VASCULAR SURGERY

A new diagnostic and therapeutic adjuvant has been introduced for the study and treatment of peripheral vascular disease and causalgic states. Tetra-ethyl ammonium bromide, in a 10 per cent solution, will produce a temporary blockade of the autonomic nervous system following parenteral administration, and promises to supplant such standard procedures as sympathetic nerve block. As the drug produces vasodilatation, a lowering of blood pressure results, and this must be borne in mind in using this drug.

Advances in vascular surgery have included as a routine procedure ligation of the major veins in the treatment of venous thrombosis of the lower extremities. Where the thrombosis extends into the pelvic veins, ligation heretofore has been considered a heroic measure. Present experiences in many clinics demonstrate the feasibility of ligation of even the inferior vena cava, or the common iliac veins. These procedures are frequently life saving.

SURGICAL TREATMENT OF CONGENITAL PULMONARY STENOSIS

A new and unique chapter in the surgery of congenital cardiac defects has materialized. The most recent advance concerns an operation designed for the cure of patients with pulmonic stenosis. The operation had its genesis in an experiment on animals, proving that one can anastomose without great risk, the end of one of the arteries arising from the arch of the aorta to the side or distal end of one of the pulmonary arteries. The increase in the pulmonary arterial blood flooding which results is followed by a gratifying elevation in the oxygen carrying capacity of the blood. After extensive experimentation on laboratory animals, the operation has been carried over to patients with pulmonary stenosis. The experience to date with the operation exceeds 100 cases, the patients ages ranging from five months to 25 years.

The results following operation in most instances have been even more striking than in the experimental animals. Children who are disabled by their congenital cardiac defects sustain and survive the operations much better than laboratory animals. As a result of the operation, collateral circulation is spontaneously developed in the stenotic child so that cyanosis disappears and his activity can be increased progressively without developing dyspnea. For the anastomosis, the innominate, subclavian and carotid arteries have been used. The subclavian artery is preferred, and the carotid is least used because interference with its function has occasionally resulted in brain complications. This achievement represents an important advance in the field of cardiovascular surgery and its implications will be watched with a good deal of interest.

TOMOGRAPHY IN THE DIAGNOSIS AND STUDY OF LUNG CAVITIES

A tomograph is defined as "a device by which it is possible to make an x-ray picture of a selected plane or layer in the body at any desired level and undisturbed by the shadows of other tissues, even bone, above or below this level. It is accomplished by giving the x-ray tube a curvilinear motion which is synchronized with a corresponding but opposite movement of the plate-holder; the unmoving center between them being the only part appearing on the plate after development."

The use of this device, while not new, has been gaining new advocates, particularly for the examination of the lungs. With tomography it is possible to demonstrate cavities in the lung with greater clarity and accuracy than by the usual x-ray technique. This applies to cavities due to carcinoma as well as other causes. It is exceedingly useful also as an aid in determining changes in the chest picture during the follow-up period after therapy. This technique has the advantage of detecting lesions in situations not visible or reachable by lipiodolography, bronchography or bronchoscopy. This technique should prove to be a valuable diagnostic aid to routine radiography of the chest.

TREATMENT OF MEDIASTINAL TUMORS BY SURGERY

The many advances in physiology, biochemistry and bacteriology, and their application to the fundamental problems of anesthesia and management of the patient as a whole, have resulted in making chest surgery a relatively safe procedure. A report on cases of mediastinal tumors at Army Thoracic Centers in the United States, based on 107 cases studied, bears out this assumption. In this series there was not a single operative death. Eighty-nine benign tumors in the mediastinum were removed successfully. All of the patients recovered promptly and returned to full activity. Where the malignant tumors were operable, equally good results were obtained. It is now felt that opening the chest to establish a definite diagnosis of a mediastinal mass is a safe and justified procedure.

LOBECTOMY AND PNEUMONECTOMY FOR PULMONARY DISEASES

While these surgical procedures have been utilized for a number of years for bronchiectasis, chronic lung abscess and neoplastic disease, it is only in the past five years that they have been employed widely in the treatment of pulmonary tuberculosis. In this condition lobectomy and pneumonectomy do not supplant the older standard forms of therapy, but are used in circumstances where the infection is not likely to be controlled by other means. The availability of such chemotherapeutic agents as streptomycin and penicillin has broadened considerably the role of surgical management of suppurative pulmonary disease.

GASTROINTESTINAL TRACT: SECTION OF THE VAGUS NERVES OF THE STOMACH FOR TREATMENT OF PEPTIC ULCER

Complete division of the vagus nerves to the stomach for treatment of intractable duodenal ulcer was carried out on 2 patients in 1943. These operations followed years of experimental work on the effect of the vagus nerves in experimental animals.

It has been shown that the chief secretory abnormality in ulcer patients is the secretion of abnormally large amounts of gastric juice in the intervals between meals, particularly at night when the stomach is empty. There is also evidence that this hypersecretion is neurogenic in origin and that gastric secretion can be greatly diminished by section of both vagus nerves to the stomach. Patients with peptic ulcer have been shown to have hypertonicity and hypermotility of the stomach during a resting period, and these reactions are returned to normal following vagus section.

The results with the original two patients in 1943 were very encouraging and the operation has now been performed on over 250 cases with a very high percentage of cures. Duodenal ulcers have been proven by x-ray and gastroscopy to have healed in, as early as, 7 days following vagus section. Secondary gastroenterostomy has been necessary in some patients to relieve the obstruction due to extreme scarring and fibrosis which was present at the time vagus section was undertaken.

No cases have, of course, been followed for longer than 3 years, but the salutary effect produced by vagotomy has continued throughout the period of observation. The only undesirable side effect which has followed vagus section has been distention and dilatation of the stomach which has occurred in some instances. This reaction has responded spontaneously in some patients, while in others it has been obviated by gastroenterostomy. A large percentage of the vagotomized patients have been able to resume a normal life following surgery with no restriction of diet and no medication. It is entirely possible that section of the vagus nerves may soon replace subtotal gastric resection for control of intractable peptic ulcers.

PUBLIC HEALTH

By William R. Willard
Assistant Professor, Yale University School of Medicine

WORLD HEALTH ORGANIZATION

The Year 1946 was the first full year of "peace," and Public Health was caught in the turmoil of "reconversion." In spite of this, notable progress was made in many directions.

"The most far reaching step in history to promote health among the World's people was the unanimous adoption of the Constitution of the World Health Organization and its signature by representatives of 61 governments in New York City on July 22, 1946" (Parran and Boudreau). The United Kingdom and China have already ratified the Constitution, and when 24 or more United Nations ratify it, the World Health Organization will come into being. Pending ratification, the existing international health services will continue. The existing services, it is planned, will be gradually merged into the World Health Organization. Anticipating approval of the United Nations' Assembly, the United Nations made funds available for the interim work of the World Health Organization.

This work will be conducted by an Interim Commission consisting of representatives of 18 governments. Within six months of organization, it will call a World Health Assembly to select the permanent location of the World Health Organization and to appoint a Director-General. Meantime the Commission will assemble a staff of experts and begin to negotiate agreements with the United Nations and other organizations so that it can assume the obligations of the Health Section of the League of Nations and the Office International d'Hygiene Publique. The Commission has already assumed the epidemiological functions of UNRRA, and it will meet any urgent health problems that may arise. Thus, in effect, a functioning organization is already in existence. The chairman of the Interim Commission is Dr. A. Stampar of Yugoslavia, and the Executive Secretary is Dr. G. Brock Chisholm of Canada. Thomas Parran, Surgeon General of the U. S. Public Health Service, is the representative of the United States.

The World Health Organization will have authority to adopt regulations concerning (1) sanitary and quarantine requirements designed to prevent the international spread of disease, (2) the nomenclature of disease and cause of death, and (3) standards of biological and pharmaceutical products. These regulations will be binding on all nations except those which specifically reject them or vote reservations within a specified time.

The World Health Organization will consist of an Assembly of three delegates from each nation which will meet annually to determine policies, name the states entitled to appoint representatives on the Executive Board, and appoint a Director-General. The Board, consisting of 18 members serving three-year terms, will meet at least twice a year to act as the Executive Board of the Assembly. The Director-General will appoint the staff of the Secretariat and serve as administrative officer of the Organization. It is provided that there shall be regional organizations within geographic areas determined by the Assembly as integral parts of the parent organization.

The International Conference was notable for its frankness, sincerity, and harmony. The Constitution was a statesmanlike document. The Preamble of the Constitution states, among other things:

"The health of all people is fundamental to the attainment of peace and security.

"The achievement of any state in the promotion and protection of health is of value to all.

"Unequal development in different countries in the promotion of health and control of disease, especially communicable diseases, is a common danger.

"Healthy development of the child is of basic importance: the ability to live harmoniously in a changing total environment is essential to such development."

The creation of the World Health Organization provides an opportunity for international cooperation in public health and for leadership in other activities (*Am. J. Pub. Health,* Sept., Nov., Dec., 1946, 36: 1041, 1267, 1315, 1466).

THE NATION'S HEALTH

During 1946 the health of the American people was remarkably good. The expectancy of life at birth advanced to 65 years. The mortality rate, as judged by the experience of Metropolitan Life Insurance Company policyholders during the first ten months of the year, exceeded only slightly that for the first ten months of 1945 (742.2 compared with 739.9 per 100,000 population). Unusually favorable rates during most of the year were offset by a mild influenza epidemic during the winter of 1945-46, and as usually occurs in such epidemics, the mortality rates for tuberculosis, pneumonia, and the chronic diseases increased. The death rates from home and automobile accidents, suicides and homicides, all at low points during the war, increased sharply to 1941 levels. The death rate from automobile accidents was 28 per cent above that for 1941 during the first six months of the year. However, death rates for typhoid fever, scarlet fever, syphilis, and diarrhea and enteritis reached all-time lows (*Met. Life Ins. Co. Statistical Bulletins,* vol. 127, 1946, May p. 1, July p. 7, Aug. p. 9, Nov. p. 17).

POLIOMYELITIS EPIDEMIC

Three communicable diseases presented special problems. The United States was visited by the worst epidemic of poliomyelitis since 1916; 24,517 cases being reported as of Nov. 30. As is customary with poliomyelitis, the epidemic was spotty, hitting hard in Minnesota, the Mississippi Valley, Florida, Colorado, the Dakotas, Wisconsin, California, and other widely scattered regions. Federal, state, and local health agencies, in cooperation with the National Foundation for Infantile Paralysis, by advance planning, pooling of resources, and mobilization of personnel skilled in poliomyelitis work, were able to minimize the effects of the disease by insuring adequate treatment of victims. (Report by Basil O'Connor, President National Foundation for Infantile Paralysis on 1946 Polio Epidemic.)

DIPHTHERIA

Although diphtheria was reported 14,777 times during the first 48 weeks of 1946, compared with 16,744 times for a comparable period in 1945, this disease remained a problem in many areas. The prevalence of the disease is attributed, in part at least, to returning Servicemen carrying virulent strains of diphtheria organisms acquired in foreign countries. Five per cent of soldiers sent to Army hospitals because of skin infections acquired in the tropics were found to be carriers of virulent diphtheria. This disease continued to attack somewhat older age groups than formerly. The need for continued efforts to immunize appropriate population groups exists (*JAMA,* 131: 1053, 1071, July, 1946).

SMALLPOX

Smallpox reached an all-time low in 1945 with 346 cases reported, compared with 765 in 1943 and 48,920 in 1930. It was apparent that this low would be maintained in 1946 with only 326 cases reported during the first 48 weeks of the year. In spite of this, a small epidemic occurred in the State of Washington with 61 cases and 15 deaths, and another in California with 13 cases. Vaccination programs were organized rapidly on a large scale, and epidemics were quickly extinguished. The epidemics were traced to soldiers infected with smallpox recently returned from Japan and Korea. This experience points to the need for continued vigilance against this disease and an increasing number of vaccinations (*Public Health Reports* 61: 911, 1860-61, June 14, 1946, Dec. 20, 1946).

The fears held by some that soldiers returning from the tropics would introduce serious epidemics of various diseases into the country have not materialized.

PERSONNEL PROBLEMS

As men were released from the Armed Services, many returned to their positions with official and voluntary health agencies, but many others did not. With the increasing demands for medical and public health services, health agencies were confronted with a serious shortage of personnel of all kinds, particularly of qualified professional personnel.

This situation resulted in a re-examination of personnel practices, salaries, working and living conditions, and other factors which determine whether people will enter or remain in the public health field. The American Public Health Association, through its Committee on Professional Education, has declared that salaries must be increased substantially. The nursing organizations in cooperation with the U. S. Bureau of Labor and Statistics began to query nurses by questionnaires and interviews to determine the reasons nurses left the profession, and to inquire into other socio-economic factors surrounding their positions (*Am. J. Nursing* 46: 811, Dec., 1946).

As a continuation of its efforts to increase the quality of professional workers in public health, the American Public Health Association augmented the services of its Merit System Unit which aids states in the effective application of merit system techniques in the selection of public health personnel (*Am. J. Pub. Health,* 36: 793, 1223, July and Oct., 1946).

PROFESSIONAL TRAINING

To ensure adequate professional training, the Association's Committee on Professional Education established requirements, visited and accredited schools of public health. For the academic year 1946-47, the following schools were accredited:

For the Master of Public Health

- Columbia University
- Harvard University
- Johns Hopkins University
- University of California
- University of Michigan
- University of Minnesota
- University of North Carolina
- University of Toronto
- Vanderbilt University
- Yale University

For the Doctor of Public Health

- Columbia University
- Harvard University
- Johns Hopkins University
- University of Michigan
- Yale University

(*Am. J. Pub. Health,* 36: 244, 1038, March and Sept., 1946.)

Teaching facilities in public health as in other fields, were swamped by applicants for admission. The number was materially augmented by returning veterans who wished to study, utilizing their rights under the G. I. Bill. Although many could not be accommodated, all schools had unusually large enrollments.

In addition, heavy demands were made for training foreign students in public health in United States' institutions. The demand was by no means satisfied but a number of physicians from the Orient, South America, and elsewhere were enrolled in schools of Public Health under the auspices of the Rockefeller Foundation and the Institute of Inter-American Affairs. Likewise, many foreign visitors came to observe public health work in this country, hoping to learn of developments made here during the war (*Am. J. Pub. Health,* 36: 1260, Nov., 1946).

PROFESSIONAL RESEARCH

As a reflection of the need and growing interest in training personnel in medicine and public health, several new medical schools were either projected or started (*e.g.* University of Washington and University of Mississippi), and new medical centers were planned in various places (*e.g.* Texas, New York City). Increasing interest in research and education was shown by many financial grants for this purpose from private sources, notably private industry.

The Federal Government also contributed to the impetus given research. Even though the Kilgore-Magnuson Bill to create the National Science Foundation was not enacted, Congress promoted research by appropriating to the U. S. Public Health Service several million dollars for research. (Public Law 410 as amended.) This money was specified for grants-in-aid to public and private universities, hospitals, other institutions, and to individuals. Advisory Committees of Experts in the various fields review all applications and recommend those which seem worth while. Congress also increased the appropriation for cancer research to the U. S. Public Health Service by $1,772,000.

FEDERAL LEGISLATION AND ADMINISTRATION

In Congress and in the various state legislatures, several enactments and some administrative changes of consequence to Public Health were effected. Among the latter was President Truman's Reorganization Plan Number 2 which became effective July 16. Among other things, this Plan transferred the Children's Bureau from the Department of Labor to the Federal Security Agency where it will function as an independent entity under the Social Security Administration. Here it will be coordinated more closely with the U. S. Public Health Service. At the same time the Vital Statistics functions of the Census Bureau were transferred from the Department of Commerce to the Federal Security Agency and organized as the National Office of Vital Statistics under the Surgeon General's office of the U. S. Public Health Service.

The Hill-Burton Bill (S. 191) was enacted into law with a $3,000,000 appropriation for grants-in-aid to the states to survey hospital facilities and needs. Under the law it is planned to expend a total of $375,000,000 of Federal money during five years for hospital construction. The law requires in effect a two-to-one matching of funds by the states, with the probable result that those states most in need of additional hospital facilities, the poorer states economically, will derive least benefit because of their inability to match funds. A further handicap is the lack of funds for maintenance and operation of hospitals which may be built under this act.

The Priest Bill (H.R. 4512) known as the National Mental Health Bill was enacted, appropriating $7,500,000 to the U. S. Public Health Service for the construction of mental hospitals and laboratory facilities for research and training of personnel in the study of mental diseases. An additional $1,000,000 is available to employ personnel in assisting states in research, training of personnel, and for conducting demonstration projects; $10,000,000 is available for grants-in-aid to states in developing mental hygiene programs.

The act requires a National Advisory Health Council which consists of six outstanding experts in psychiatric diseases selected by the Surgeon General. This Council will review, approve, and certify research grants, fix the number of research and training fellowships, and advise the Surgeon General in the administration of the act. This legislation represents a major advance on the national level in attacking the nation's most challenging health problem (*Am. J. Pub. Health,* 36: 1163, Oct., 1946).

Congress also doubled the appropriation to the Children's Bureau, allowing $22,000,000 for services in Maternal and Child Health and for Crippled Children. The May Act was made permanent, and the Social Protection Division of the Federal Security Agency was continued when it became apparent that commercialized prostitution was increasing in a number of areas. These measures will help in the campaign against venereal diseases.

STATE LEGISLATION

Parallel with this Federal activity, most states were active in meeting public health needs. Although only 66 per cent of the population in the United States is now served by full-time health departments, definite progress was made, particularly in Illinois, in organizing local health departments. In some areas only personnel is lacking to complete the organization. The chronic disease problem is receiving increasing attention with the establishment of Divisions or Sections of Geriatrics in the State Health Departments of Indiana and South Carolina (*Am. J. Pub. Health,* 36: 202, 693, Feb. and June, 1946). Other states have organized or projected Cancer Control Divisions (*e.g.* Maryland, Kansas, Louisiana). Ohio appropriated $3,727,000 to improve the care of the mentally ill. Increased appropriations for public health will permit many areas to attack major problems, fill existing gaps, and level up the public health services of the nation. This is particularly true in New York State where Governor Dewey's program was enacted, which among other things, made available approximately $5,500,000 for local health services and $6,000,000 for tuberculosis (*Am. J. Pub. Health,* 36: 526, May, 1946).

SCHOOL HEALTH

The National School Lunch Bill (H.R. 3370), enacted in 1946 by Congress, made available $75,000,000 in the form of grants-in-aid to state educational agencies through the Department of Agriculture. The permanent support of school lunch programs, by this act, has become a national policy (*Am. J. Pub. Health,* 36: 828, July, 1946).

Although no other outstanding development occurred in the field of school health, interest increased, program evaluation continued, and experimentation toward more effective programs progressed. The emphasis was on cooperation between Departments of Education and Health in planning, preparation of materials, and integration of medical and educational services. This is in keeping with one of the recommendations made by the National Committee on School Health Policies in its revised report entitled "Suggested School Health Policies," published in 1945 by the Health Education Council, 10 Downing Street, New York City.

VOLUNTARY HEALTH AGENCIES

The effect of the Gunn-Platt report on voluntary health agencies, issued in 1945, continued with many agencies re-evaluating their programs. With a grant from the Rockefeller Foundation, the National Health Council, under the leadership of a Citizens Planning Committee and a new director will assist in the development of cooperative enterprises. These will consist of joint planning and services, the organizing and strengthening of loca health councils, the conducting o demonstrations in the coordination o local health services, and providing consultation aid (*Am. J. Pub. Health* 36: 427, April, 1946).

The six national nursing agencies believing that their respective interests might be served better by closer coordination, employed the Rich Associates, Inc. to make a structure study. The recommendations of this survey, calling for the unification of the six national agencies into one, is now under consideration (*Am. J. Nursing,* 46: 648, Oct., 1946).

APPLICATION OF SCIENTIFIC ADVANCES

Discoveries of recent years found increasing application in medical and public health practice. Recognizing the value of plasma, gamma globulin, albumin, and other products derived from blood, the American Red Cross and several states are giving serious consideration to means of ensuring an adequate supply and proper distribution of these products for civilian use. Both Michigan and North Dakota have begun to collect, process, and distribute plasma on a statewide basis, and Massachusetts is developing a similar program. Health Departments must assume, if nothing more, a regulatory function in seeing that the public is protected from diseases carried by these products and ensuring their ready availability (*Am. J. Pub. Health,* 36: 1, 309, 389, Jan., March, April, 1946).

The discovery of the Rh factor is making possible the saving of many infant lives, and health department laboratories in a number of areas began to type blood specimens submitted by physicians for Rh factor (*Am. J. Pub. Health,* 36: 101, Feb., 1946).

The value of vaccine against influenza types A and B has been established, and will find increasing application for civilian use. During the fall of 1946 it was widely utilized in various industries.

Although penicillin has not been completely evaluated, it has already earned for itself an essential place in the treatment of gonorrhea, syphilis, and many other infections. Streptomycin offers promise of aid in the treatment of various diseases, including tuberculosis, but this product is still under study and is not generally available.

New drugs of promise have been developed for malaria (*Am. J. Pub. Health,* 36: 432, April, 1946), and the use of DDT in conjunction with other measure should make possible the eradication of this disease from the United States. DDT is finding many uses in the control of insects of public health importance, of which the treatment of pediculosis in school children is a lesser example. The new rodenticides ANTU and 1080 will also fill a need.

MEDICAL CARE

This subject continued to loom large in the attention of the medical and public health professions. Extensive hearings were held on the Wagner-Murray-Dingle Bill (S. 1060), which in Title 2, proposes compulsory health insurance, federally administered. The Taft-Smith-Ball Bill (S. 2143) was introduced. This bill, among other proposals, called for the development of programs of medical care for persons of low income only, these programs to be administered by the states and financed in part from Federal grants-in-aid to the states.

While the great debate raged over these proposals, voluntary plans for providing medical care on a pre-payment basis increased in number and membership. As of June 30, almost 3,500,000 persons were enrolled in medical society plans and the number was constantly increasing (*J.A.M.A.,* 132: 584, Nov. 9, 1946). Twenty-seven of these plans were awarded the Seal of Acceptance by the Council of Medical Service of the American Medical Association, and others awaited action by the Council. Blue Cross Hospital insurance plans approached an enrollment of 24,000,000 persons.

The Voluntary Health Insurance Plan of Greater New York completed organizational work. If successful, it will stimulate the organization of group medical practice in combination with pre-payment because, under this plan, medical care will be rendered only by groups of physicians (*Am. J. Pub. Health,* 36: 912, Aug., 1946).

The Maryland Program of Medical Care for the indigent and medically indigent went into effect July 1, 1945 with most counties actually operating under the program by Jan. 1, 1946. This program is the first of its kind to be operated by a State Health Department, and is being closely watched by all interested in the administration of medical care plans. The medical profession is paid a fee on a service basis and is actively cooperating. During the month of April, 1946, 2,147 persons out of a population of about 1,000,000 received care. Ninety-five per cent of these persons were on relief. Most were suffering from serious illness. About half were aged 60 or above (*J.A.M.A.,* 132: 326, Oct. 12, 1946).

MEDICAL CARE FOR VETERANS

Medical care for veterans was in the process of re-organization. Legislation creating a Department of Medicine and Surgery in the Veterans Administration was enacted early in the year (Public Law 293), and Major Gen. Paul R. Hawley was placed in charge. Continuous efforts to secure the best qualified men have been made, and rigid civil service procedures for appointment were relaxed. Contracts were made with medical societies to enable veterans to receive medical care at home when practicable. A building program for Veterans Hospitals near medical centers was projected. Arrangements by which medical centers assisted in staffing Veterans Hospitals were effected in a number of instances, and these arrangements are working to the mutual advantage of the institutions concerned.

HOSPITAL SERVICES

Integration and improvement of hospital services is being attempted under the Regional Hospital Plan at Rochester, N. Y. This program is financed by a grant from the Commonwealth Fund for a five-year period. Rural hospitals in the area will secure the advantages of contact and some interchange of staff with a city teaching center. Consultation and educational services will be provided for rural hospital staffs, and hospital facilities will be enlarged and improved as needed. If successful, this plan will be tried in other areas (*J.A.M.A.,* 130: 804, March 23, 1946).

INDUSTRIAL MEDICAL SERVICES

The National Bituminous Coal Mine Wage Agreement of 1946 was the most significant development on the Industrial Front. Under this Agreement, two funds are created: (1) Welfare and Retirement Fund by a 5 per cent per ton impost on all coal produced; and (2) Medical and Hospital Fund by a check-off from the miners' pay. Medical services, under this agreement, were transferred from the control of coal operators to the Union, and no doubt this is a precedent which will be followed in many other collective bargaining agreements (*J.A.M.A.,* 132: 453, Oct. 26, 1946).

Also of significance was the first joint meeting of the four large labor organizations, A. F. of L., C. I. O., R. R. Brotherhoods, and National Farmers' Union in St. Paul during February 1946 to discuss the development of health programs of interest to Labor. Plans were made to assist appropriate governmental agencies in the development of these programs. Additional meetings were scheduled. As in international relations, so in labor relations, it was possible to submerge rivalries in order to work for the common good in the field of public health.

ENVIRONMENTAL SANITATION

The failure of the Wagner-Ellender-Taft Bill to be reported out of the House Committee on Banking and Currency has delayed the formulation of a national housing policy and the development of slum clearance programs. However, the assignment of sanitary engineers from the U. S. Public Health Service to the National Housing Agency should ensure improved sanitation in Veterans' housing developments.

Progress in milk sanitation was recorded when the U. S. Public Health

Service reported that 192 municipalities require all market milk to be pasteurized; 277 permit raw milk for market sale only if it is certified; three others permit the market sale of certified raw milk only upon the prescription of a physician. Although half of these municipalities are in New York or Massachusetts, there are only 15 states with no municipality which requires market milk to be pasteurized (*Am. J. Pub. Health,* 36: 1466, Dec., 1946).

There was little progress in the abatement of stream pollution during the year, although general agreement on future legislation seems to have been reached.

DENTISTRY

By Houghton Holliday
School of Dental and Oral Surgery, Columbia University

POST-WAR ADJUSTMENT

During 1946 Dentistry endeavoured to readjust itself to caring for the needs of a civilian rather than a military population. The problem was not a simple one, and the close of the year did not find it solved. Large numbers of dental officers released from service with the Army and the Navy have returned to civil life, hoping to resume or begin a private practice. Particularly in the large cities, these dentists have been unable to find office space, and, regardless of location, it has been impossible to secure office equipment in less than six months to a year's time. As an alternative some have been able to associate themselves with older practitioners either on a full-time or part-time basis. Many have taken advantage of the opportunity afforded by the G.I. Bill of Rights to pursue postgraduate work in the various dental schools. Some are taking extended courses with a view to preparing to specialize in some particular branch of dentistry. Others are taking shorter "refresher" courses designed to help the dentist adjust himself to the needs of private practice and to bring him in touch with some phases of dental practice with which he has been out of touch while in military service.

THE EDUCATIONAL PROGRAM

While adjusting their curricula and teaching staffs to care for the large influx of postgraduate students, the dental schools, like the medical schools, have abandoned the accelerated program. The course again requires four years following the necessary college background. Students are admitted only once in a calendar year, and the summer vacation period is restored. After the chaos, the strain, and the doubtful advantage of the accelerated program under Army and Navy auspices, the return to the academic year basis is welcomed by students and faculties alike. One of the chief advantages is that teachers are now able to resume research projects that had to be put aside during the war years. In fact, a number of very important studies were reported during 1946. A brief review of some of these follows.

EFFECT OF VITAMIN K ON THE INCIDENCE OF DENTAL CARIES

It seems to be fairly well established that dental caries depends upon, first, the rate of acid formation in the mouth, and, second, the rate of neutralization of acid in the regions associated with the caries-susceptible portions of the teeth. On this basis it should be possible to retard dental caries by decreasing the rate of acid formation on the one hand or by increasing the rate of acid neutralization on the other. Most of the successful experiments to control caries have worked by decreasing the rate of acid formation, it being much more difficult to control the rate of neutralization. The reduction of acid has been accomplished by the reduction of fermentable sugars and carbohydrates in the diet or by eliminating the acids formed from the mouth by mouth hygiene. The difficulty with these methods is that they depend entirely upon the cooperation of the patient, and thus can not be expected to be successful when applied to large masses of the population.

Also, the formation of acids in the mouth may be retarded by using any one of several ingredients which interfere with the enzyme systems which are necessary to acid production. A 30-per cent urea solution used as a mouth wash destroys the enzymes and hence prevents the formation of acid from carbohydrate foods. It was found that synthetic vitamin K also had the ability to prevent the formation of acid in saliva-glucose mixtures. D. Y. Burrill, J. C. Calandra, E. B. Tilden and L. S. Fosdick have made a significant study of the effect of this later material (*Journal of Dental Research,* vol. 24, pp. 273-349). The occurrence of new decay and the progress of decay already present was studied clinically and by means of the x-ray over a period of 18 months. Commercial chewing gum was used as the vehicle for administering the vitamin K. Members of one group of 58 chewed gum containing the vitamin K for ten minutes following taking of food over a period of 18 months. Those in another group of 45 chewed gum in the same manner which did not contain the vitamin K. A third group under scrutiny did not chew gum. No restrictions were placed upon the diet of the members of any group. The vitamin K gum reduced the occurrence of new cavities 60 per cent, and the gum without vitamin K reduced the inception of cavities approximately 30 per cent as compared with the control group. Gum appears to be a very good vehicle for the vitamin K, and its popularity might make it possible to apply this method of caries control to a large group of individuals. It is hoped that further study may result in the discovery of a material or a method of applying an acid inhibitor by means of some universally used substance, such as drinking water or sugar.

ORAL CONDITIONS IN EXPERIMENTAL VITAMIN C AND B DEFICIENCY

A study of the oral conditions of five individuals deficient in vitamin C, four deficient in vitamins C and B, and two control subjects has been reported by Dan Y. Burrill (*Journal of the American Dental Association,* May 1946, pp. 594-600). Though the number of cases involved in this study is small, the findings corroborate those of several animal studies and observations made on large numbers of undernourished individuals. The deficiency was produced by a controlled diet and extended over a period of seven months. The subjects, all of whom volunteered for the study, were examined at regular intervals, clinically, by means of x-rays, and with color photographs. They were required to carry out a strict program of mouth hygiene. No oral changes of any kind were found that could be attributed to the vitamin deficiency. The author concludes that "... Even severe vitamin C and B deficiencies do not produce symptoms in clean mouths of young adults, at least in a period of seven months, and that, at least for the period of time covered by this study, dietary adequacy is less important for oral health than is oral cleanliness."

It is interesting to compare the results of this study with those reported in THE AMERICAN YEAR BOOK (1944, page 844), in which the oral conditions of children in the famine districts of Hissar were reported as being much better than those of the comparatively well-nourished children in America.

WORLD HEALTH ORGANIZATION

As a result of a declaration made at the United Nations Conference in San Francisco in 1945, an International Health Conference was held in New York in June 1946. Fifty-one nations were represented at this conference at which a charter was drawn for a World Health Organization.

This Organization has been given unprecedented power in the field of international health and will have, when ratified, a significant influence on international health. This agency will seek to throw up effective barriers against disease between and within countries, to stimulate and coordinate research on health menaces on an international basis, and to spread health information to all peoples. Dr. Frank C. Cady represented dentistry at the Conference.

DENTAL CARE IN PREPAYMENT HEALTH ORGANIZATIONS

The dental profession has long been aware of the relation between oral and general health. The public, however, has been slow to recognize this. The high percentage of young men rejected for service in the military forces has awakened the country to a greater appreciation of the importance of dental health. However, ignorance has been only one of the barriers to the more complete utilization of dentistry's services. The problem of cost is still an unsolved problem for many people. This same problem, as it applies to medical service, has been partially met by spreading the cost of hospital care over large groups of people. Something over 18,000,000 people are entitled to hospital care through Blue Cross plans alone.

The dental profession has made a study of the various medical plans in existence with a view to setting up similar plans for providing dental service. It is found that some type of dental service is provided for about one-third of the members of the various prepayment medical plans. A few organizations provide examinations, extractions, fillings, prophylaxes, roentgenograms, and surgery on a prepayment basis with an additional charge for prosthetic service. In the 229 organizations studied, the medical service is more or less complete, whereas the dental service is usually limited to roentgenograms and is included as a part of the medical diagnosis.

As a result of the study, the Council on Dental Health of the American Dental Association has recommended that experimental dental service prepayment plans be inaugurated under the supervision of the component societies. Owing to the shortage of dentists it is necessary that these plans be restricted to the care of children, where the greatest long-range benefits may be accomplished. The greatly increased demand for adult dental care during the war resulted in a reduction in emphasis on dental care for children.

SURGICAL ANESTHESIA

Oct. 16, 1946 was the centenary anniversary of the introduction of ether anesthesia into surgical practice. It is of interest that the nationwide commemoration of this event came so close to the end of a war that brought so much suffering to humanity. Though the anesthetic properties of ether had been referred to by others before Oct. 16, 1846, it remained for William Thomas Green Morton, a dentist, to administer it at that first public demonstration in the amphitheater of the Massachusetts General Hospital in Boston. Because of his courage on that day Morton will always be regarded as a central figure in that group of men who have brought the blessings of anesthesia to mankind. An appropriate ceremony was conducted in Boston on Oct. 16, 1946 under the direction of the American Dental Association.

At this celebration the production of anesthesia in limited areas without the loss of consciousness was also reviewed. Local anesthesia dates from the invention of the hypodermic syringe in 1845 and the discovery of cocaine in 1879. The highly toxic cocaine was largely replaced by a synthetic drug, novocaine, which was discovered in 1905. The use of this and similar anesthetic agents has grown by leaps and bounds in both the dental and medical professions. The methods of administering local anesthesia fall into two main groups: (1) the nerve block in which all of the nerve fibers peripherally to the point of injection are anesthetized, and (2) the infiltration method, in which the anesthetic is limited to the tissue through which the anesthetic diffuses from the point of injection.

The use of local anesthesia has greatly extended the field of dental surgery and has made it possible to perform many surgical procedures in the office that would otherwise require hospitalization and the added risk incident to a general anesthesia. Procaine (novocaine) has been the drug of choice for years, but it is to be hoped that an even safer and more effective agent may be produced as the result of extensive efforts which are being made in this direction.

DENTAL EDUCATION AT COLUMBIA

Turmoil over the announced further integration of dental with medical education at Columbia University, referred to in THE AMERICAN YEAR BOOK (1945, page 886), has partially subsided. The highly emotional reactions of a year ago have been replaced for the most part by serious appraisals of the plan, a good example of which is the following written by Dr. Arthur H. Merritt (*New York Journal of Dentistry,* March 1946, Vol. XVI, No. 3):

"One does not need to approve or disapprove of the changes which have taken place in dental education at Harvard and Columbia, to feel a certain measure of concern for the reaction of the dental profession toward these changes.

"As long as dentistry was looked upon as a craft to be practiced by craftsmen and nothing else, the public showed little interest in dental education. And this has been the situation throughout most of its history despite a hundred years in which great progress has been made. Dentistry has not been regarded by the public generally, as a learned profession. It has been thought of, rather, in terms of repair and replacement of diseased and aching teeth and the dentist as little more than a technician. With this attitude toward dentistry as a profession, little concern was felt for its educational requirements. But fortunately for all concerned, that day has passed or is passing—a fact that must be reckoned with if the recent departures in dental education are to be seen in their true perspective.

"No greater compliment was ever paid to American dentistry than that now being given to it, namely, the recognition that dentistry is an important health measure and should be made the educational equivalent of a specialty of medical practice. And to this, organized dentistry replies by pointing to its accomplishments in the past and by denying to the graduates of these schools the right to practice in certain states. This attitude on the part of the profession is given wide publicity by the lay press, creating the impression in the public mind that dentistry is more concerned with preserving its autonomy than in serving the public. This is unfortunate.

"No one, not even the Universities themselves, regard the present experiments in dental education as the final answer to the problem. They are nothing more or less than further steps in the evolution of dentistry. There can be no doubt, however, that they do represent a sincere desire on the part of those engaged in the experiment to advance the status of dental education, and as such, should be given respectful consideration by the dental profession.

"Dentistry must and will go forward. In so doing, it is as inevitable as the ebb and flow of tides that it will become more closely integrated with medicine. It cannot in the nature of things be otherwise. Pride in past accomplishments, resolutions of protest, denial of the right to practice to certain of its graduates, may delay but cannot turn back the wheels of progress.

"Dentistry's attitude, therefore, should be one of open-mindedness rather than one of opposition; wider opportunities for service rather than pride in past performances. If, in following such a course, it should become necessary to radically change dentistry's educational policy, or perhaps eventually to lose its identity as a separately organized profession, it would be a matter of little consequence if, in so doing, it was able to widen its sphere of usefulness."

VITAL STATISTICS

By Halbert L. Dunn
Chief, National Office of Vital Statistics,
U. S. Public Health Service

WARTIME BIRTH, MARRIAGE, AND DIVORCE RATES

During 1945 the birth rate for the United States declined further from the wartime high reached two years earlier. The crude birth rate for the United States in 1945, based on estimated total population, including the armed forces overseas, was 19.6 per 1,000 population, or 3.0 per cent lower than the corresponding rate of 20.2 for 1944. The birth rate was 21.5 in 1943. Rates for earlier years are shown in Table A. In terms of numbers, there were 2,735,456 registered births in the United States in 1945, as compared with 2,794,800 in 1944 and 2,934,860 in 1943.

Following the improved economic conditions of 1939, the marriage rate per 1,000 population began to increase (Table A), and many couples who had delayed establishing families started to do so. With the passage of the Selective Service Act in 1940 and the entrance of the United States into the war, the marriage rate rose further, reaching in 1942 a peak of 13.2 marriages per 1,000 population, excluding the armed forces overseas. The birth rate reached its wartime peak in the following year. The recession in the birth rate from 1943 to 1945 reflected the absence from the country of large numbers of men and the decrease in the marriage rate from 1942 to 1944.

Active demobilization of some units n the European theater began in June, 1945. By July, marriage licenses had begun to show a decided increase over the numbers issued during comparable months in the preceding year. July 1946 marked the beginning of an extraordinarily rapid rise in the number of registered births. On the basis of provisional figures it is estimated that over 3,240,000 births were registered in the United States during 1946, representing an increase of at least 18.6 per cent over the number reported in 1945.

The divorce rate rose steadily during the war period, from 2 per 1,000 estimated population (including the armed forces overseas) in 1940 to 2.9 in 1944. The divorce rate then rose more sharply, reaching 3.6 in 1945.

BIRTHS BY RACE AND STATE

White births numbered 2,395,563 during 1945, while Negro births totaled 324,264, and births to other race groups (primarily Indian, Chinese, Japanese and Filipino) amounted to 15,629. As percentages, the white comprised 87.6 per cent, the Negro 11.8 per cent, and the other races 0.6 per cent of the total number of births registered in 1945. Of total births reported in 1944, the white comprised 87.8 per cent, the Negro 11.6 per cent, and the other race groups 0.6 per cent.

Birth rates for 1945 by state of residence, based on estimated civilian population in each state, ranged from 18.4 for Illinois to 31.2 per 1,000 population for New Mexico. Four states showed higher birth rates in 1945 than in 1944, the increases amounting to 2.2 per cent for New York, 1.6 per cent for the District of Columbia, 0.9 per cent for California, and 0.9 per cent for Vermont. Largest decreases (6.4 to 8.5 per cent) in birth rates by state of residence occurred in Arizona, Louisiana, Nevada, and Oklahoma.

WARTIME DEATH RATES

The crude death rate in continental United States was the same in 1945 as

TABLE A

BIRTH, MARRIAGE, DIVORCE, AND DEATH RATES, AND MATERNAL AND INFANT MORTALITY RATES: UNITED STATES, 1937-1945

(Births and deaths exclusive of stillbirths)

Year	Rate per 1,000 Estimated Population			Rate per 1,000 Live Births		
	Birth	Marriage	Divorce[1]	Death	Maternal Death	Infant[2] Death
1945	[3]19.6	[4]12.3	[3]3.6	[4]10.6	2.1	38.3
1944	[3]20.2	[4]11.0	[3]2.9	[4]10.6	2.3	39.8
1943	[3]21.5	[4]11.8	[3]2.6	[4]10.9	2.5	40.4
1942	[3]20.9	[4]13.2	[3]2.4	[4]10.4	2.6	40.4

1940	[3]17.9	[4]12.1	[3]2.0	[4]10.7	3.8	47.0
1939	17.3	10.7	1.9	10.6	4.0	48.0
1938	17.6	10.3	1.9	10.6	4.4	51.0
1937	17.1	11.3	1.9	11.3	4.9	54.4

[1] Includes annulments.
[2] Deaths under 1 year of age.
[3] Based on total population including armed forces overseas.
[4] Excludes armed forces overseas.

in 1944, the rate for both years being 10.6 per 1,000 estimated population exclusive of the armed forces overseas. This rate was 10.9 during 1943, when an influenza epidemic caused a rise in the crude death rate. In terms of numbers, there were 1,401,719 deaths in continental United States during 1945, as compared with 1,411,338 in 1944 and 1,459,544 in 1943.

Interpretation of the crude death rate is subject to certain limitations because it is computed from the number of deaths and population within the continental United States. The overseas population has consisted largely of men in the younger age groups. Normally, the death rate for these men is low. Their absence from the country left an older population, and even assuming no change at all in underlying mortality risk, the crude death rate for the continental population of the war years would have to be higher than the crude death rate for the population of pre-war years.

For the war period, therefore, the crude death rate is a relatively poor measure of the change in mortality risk from year to year. A better picture is given by the data of Table B, which shows the number of deaths and the death rates for certain age groups in the population. Examination of the table shows that, in 1945 as compared with 1942, the death rate for the age group 5-14 years remained the same and the rate for the group aged 15-24 years increased somewhat, probably because the more physically fit young men were selected for military duty overseas. Otherwise, each age-specific rate shows a sigificant decline from 1942 to 1945. In general, therefore, underlying mortality conditions within the United States have shown real improvement during the war despite the higher crude death rate in 1945 as compared with 1942.

During 1945, death rates by state of residence varied from 8.2 for North Carolina to 12.9 for Vermont. Increases in these rates from 1944 to 1945 were largest (3.3 to 4.5 per cent) in Colorado, Idaho, and Virginia. The greatest decreases (5.3 to 5.8 per cent) were reported from Nevada, South Carolina, and Vermont. In some part these figures may reflect real changes in mortality risk, but variations in the composition of the populations of the states by age, race, and sex have probably been more important factors.

Provisional data indicate that, during the first 10 months of 1946, the number of deaths in the United States was approximately 1.6 per cent larger than the number recorded during the first 10 months of 1945. However, most of this increase in number of

[3] Excludes armed forces overseas.

deaths reflects the demobilization and return to continental United States of several million men, and probably does not indicate an unfavorable change in mortality risk in this country during 1946.

DEATHS BY CAUSE

During 1945, deaths from major infectious diseases declined to new lows in the United States. The year set a record low for pneumonia and influenza. Deaths from these respiratory causes totaled 68,386, which was 16.4 per cent less than the number reported for 1944, and 8.2 per cent less than the previous minimum (1942). Deaths from tuberculosis continued to decrease during 1945. The number of deaths in the United States from this cause was 52,916, or 3.3 per cent less than the number in 1944 and less than in any previous year. Meningitis, scarlet fever, whooping cough, dysentery, malaria, syphilis, measles, and poliomyelitis also declined (Table C).

Motor-vehicle accident deaths rose sharply to 28,076, increasing 15.7 per cent over the 1944 figure. Most of this increase took place in the second half of 1945 after gasoline rationing ceased. Deaths from other accidental causes totaled 67,842, which represented a decrease of 4.4 per cent from the 1944 figure.

The ten leading causes of death in 1945 were the same ones that headed the list in the pre-war years 1939-1941. Heart disease ranked first, accounting for 424,328 deaths or 30.3 per cent of the total 1,401,719 deaths in 1945. Cancer ranked second, claiming 177,464 deaths or 12.7 per cent. The next four causes were intracranial lesions (129,144 deaths), nephritis (88,078), pneumonia and influenza (68,386), and accidents other than motor-vehicle (67,842). The last four of the ten leading causes were tuberculosis (52,916), diabetes mellitus (35,160), premature birth (31,614), and motor-vehicle accidents (28,076). Except for motor-vehicle accidents, the rank order of these ten leading causes in 1945 was the same as in the period just preceding the war years. Owing chiefly to wartime restrictions on driving, motor-vehicle accidents dropped from eighth place in 1939-1941 to tenth place in 1942-1945.

INFANT AND MATERNAL MORTALITY

The infant mortality rate, or deaths under one year of age per 1,000 live births, was 38.3 in 1945, the lowest ever recorded for the United States. This rate represented a decline of 3.8 per cent from the corresponding rate of 39.8 in 1944. In terms of numbers. 104,684 infant deaths were registered in the United States during 1945, as compared with 11,127 in 1944.

In 1945, infant mortality rates by state of residence were lower than 30 in Connecticut, Nebraska, North Dakota and Oregon, while they were higher than 50 in Arizona, Colorado, New Mexico, and West Virginia. In general, infant and maternal mortality rates vary with the accessibility of medical and nursing care for mothers and infants, with the effectiveness of communicable disease control, and with the distribution of births by race and age of mother. Other factors influencing the infant mortality rate are incomplete registration of births and incomplete registration of infant deaths, but to some extent these factors tend to be canceled out in the rate as conventionally computed.

The maternal mortality rate was 2.1 per 1,000 live births in 1945, which represented a decrease of nearly 9 per cent from the corresponding rate of 2.3 in 1944. The 1945 figure was the lowest ever recorded for the United States. The numbers of maternal deaths (all puerperal causes) were 5,668 in 1945 and 6,369 in 1944.

A major factor contributing to the favorable trend in both infant and maternal mortality rates has been the marked increase in the proportion of infants delivered in hospitals or similar institutions. This proportion was 78.8 per cent in 1945, as compared with 75.6 per cent in 1944. Throughout the past decade this percentage has been rising steadily, from 36.9 per cent in 1935. As estimated from this trend, the proportion of births occurring in hospitals was probably close to 81.5 per cent in 1946.

TRANSFER OF VITAL STATISTICS TO THE U. S. PUBLIC HEALTH SERVICE

On July 16, 1946, in accordance with Reorganization Plan No. 2, the Congress of the United States transferred the Vital Statistics Division from Bureau of the Census to the Federal Security Agency. Within the Federal Security Agency, the Division was reconstituted and reorganized as the National Office of Vital Statistics, and placed in the Office of the Surgeon General of the United States Public Health Service.

Following the First World War, birth certificates began to be used extensively in the enforcement of regulatory laws dealing with child labor and compulsory education. From 1935, the use of the birth certificate for its legal and probative value began to increase rapidly throughout the country. This arose largely from public and governmental interest in proving the age of individuals so as to establish the rights to pensions and social security benefits.

This wholesale need for birth certificates, frequently for persons born prior to the establishment of such records in many states, led to the overloading of the bureaus of vital statistics in state after state. These organizations streamlined their offices, dropping statistical and other functions, in order to meet the public demand for birth certificates.

In 1941, wartime pressure for improvements gave rise to the introduction of various bills in the Congress aiming at either coordination or federalization of the loose-knit vital statistics system. In order to clarify the confusion, the President of the United States recommended opposition to the enactment of any legislation, pending a study by the Bureau of the Budget (House Document No. 242, 78th Congress, 1st Session—"Message from the President of the United States transmitting Report of the Bureau of the Budget on Measures Relating to Vital Records and Vital Statistics"). A Commission on Vital Records was appointed in December 1941.

The first recommendation of the Commission dealt with the possibility of a national population registration during wartime. This was not carried out. The second and third recommendations called for the creation of a single Federal agency to be charged with the problem of coordinating the existing vital records organizations of the country at national, state, and local levels into a complete system. In interpreting these recommendations, the Commission was unanimously of the opinion that the vital records structure at its local level should remain as at present in the hands of the health officers, but that there should be some Federal agency that would be charged with the responsibility of strengthening and coordinating the existing vital records organizations of the country, and that this coordinated system would have as its principal objective the serving of the various national, state, local and individual needs in the use of vital records and vital statistics.

The Commission's report gave particular stress to the need for a single locus of authority at the Federal level. With the transfer of the Vital Statistics Division from the Bureau of the Census to the United States Public Health Service and its reconstitution as the National Office of Vital Statistics, this locus of authority has been created, and the Office is developing a long-term program which should fully satisfy the needs for vital records and social statistics in the United States.

PROPOSED STATISTICAL CLASSIFICATION OF DISEASES, INJURIES, AND CAUSES OF DEATH

Uniform classification of causes of diseases and deaths is fundamental to the statistical study of illness and death. Since 1900, there has been for international use a uniform system for the classification of causes of death. This classification system, known as the International List of Causes of Death, is revised decennially by the International Conference. The preparatory work for the International Conference is done by the participating nations, and the proposed revisions are discussed and acted upon at a decennial meeting which has been held in Paris.

The United States Department of State has created a committee to conduct certain preparatory work on this subject. During 1946 this committee developed a "Proposed Statistical Classification of Diseases, Injuries and Causes of Death" and has begun pilot studies with its use in Canada, England, and the United States.

Much remains to be done in the refinement of the proposed classification, after which it will be submitted to the Interim Commission of the World Health Organization as a basis for the deliberations of the 1948 International Conference to revise the International List of Causes of Death. Since this is the first time that a combined morbidity-mortality list has been devised, the many problems that arise in classification are without precedent. Also to be considered are statistical practices and usages of medical terms in foreign countries as well as in the United States, so that the proposed List will be acceptable internationally.

MARRIAGE AND DIVORCE STATISTICS PROGRAM

A widespread and insistent demand for more complete marriage and divorce statistics has existed for many years. The principal reason for the neglect of these statistics in the past has been the lack of accessibility of marriage and divorce records owing to the absence in many states of centralized collection of such records. Lack of uniformity in state laws, a frequent disregard of the requirements for good registration, and wide diversity in the form and content of the records have contributed to the problem.

The successful development of birth and death registration areas points the way to the development of a similar mechanism for collecting national statistics for marriage and divorce. Marriage and divorce registration areas can be defined according to minimum standards of completeness and accuracy of data, and states with adequate registration systems can be admitted to the areas as soon as they are established. At present, 33 states have provisions for central registration of marriages and 23 states have provisions for obtaining abstracts of divorce decrees centrally. The marriage records are filed in the state department of health in all but one of these states, while transcripts of the divorce records are so located in all but two states.

At its annual meeting in December 1946, the Association of State and Territorial Health Officers went on record as endorsing the centralization of marriage records and certificates and official abstracts of divorce records in state health departments. The development of minimum standards for marriage and divorce registration areas analogous to those used to establish birth and death registration is now being considered by the National Office of Vital Statistics in cooperation with state registrars of vital statistics.

COOPERATION WITH AMERICAN REPUBLICS

The International Vital Statistics Cooperative Program, inaugurated in 1942 as a part of the State Department's program for cooperation with the American republics, has continued its work of assisting officials of the American republics in the study and development of their vital statistics and related statistics in the fields of public health and demography.

During 1946, new projects were instituted in Bolivia, Brazil, Cuba, and Panama, and training grants in vital statistics were extended to officials of the Dominican Republic, El Salvador, Honduras, and Nicaragua.

PUBLICATIONS

The following regular series of publications pertaining to vital statistics were issued during 1946 by the National Office of Vital Statistics: *Vital Statistics of the United States, 1944,* Part I (By place of occurrence), Part II (By place of residence); *Weekly Mortality Index; The Registrar,* a monthly release; *Monthly Vital Sta-*

tistics Bulletin; Current Mortality Analysis, a monthly release; *Marriage Licenses Issued in Cities of 100,000 Inhabitants or More,* a monthly release; Quarterly Marriage Report for States; *Vital Statistics-Special Reports, National Summaries,* Vol. 25, numbers 1-16, containing tables and analytical text on various topics in vital statistics for the United States, 1944; *Vital Statistics-Special Reports, State Summaries,* Vol. 24, numbers 1-53, containing summaries of 1944 data for the United States, each state, Territory of Hawaii, Puerto Rico, and the Virgin Islands; *Vital Statistics-Special Reports, Selected Studies,* Vol. 23, numbers 7-10, containing analytical and descriptive studies in the field of vital statistics; *Annual Summary of Motor Vehicle Accident Fatalities, 1944.*

DIVISION XXIV

PSYCHOLOGY, PHILOSOPHY, ANTHROPOLOGY

PSYCHOLOGY

By Wilbur S. Hulin
Professor, Pacific University

GENERAL

Mind and Mechanism.—E. G. Boring asks whether or not "robotism" is profitable in psychology; he accepts this type of hypothetical thinking until sufficient data in psychophysiology are obtainable for the complete description of mental processes as neural acts (*Amer. J. Psych.*, April 1946). Considering "our knowledge of other minds," J. Weinberg points out that our multiple accessibility to material objects has greater validity than has our limited inference of the existence of other minds (*Philos. Rev.*, Sept.). W. C. H. Prentice revives the discussion of operationism in psychology, declaring that experimental techniques give objectivity to hypotheses and thus permit a disregard of the "operationist kibitzer" who insists upon complete definitions of concepts (*Psych. Rev.*, July).

Presidential Address.—E. R. Guthrie, in his presidential address before the American Psychological Association, expressed the hope that the increasing number of young psychologists will not become mere technicians, but will realize that an accumulation of facts without an adequate background of theory is unstable (*Psych. Bull.*, Jan.).

Textbooks.—A widely adopted new textbook is found in the generously illustrated volume by N. L. Munn, called *Psychology* (Houghton Mifflin). W. Wolff's book, *What is Psychology,* aims at reaching the depth of personality (Drexler). J. S. Gray's *Psychology in Human Affairs* (McGraw-Hill) refers to such applications as vocational guidance, school and college life, drugs, and speech correction. B. V. Cunningham offers a *Psychology for Nurses* (Appleton-Century). *Twentieth Century Psychology,* edited by P. L. Harriman, contains a collection of special articles on the major topics of psychology (Philos. Lib.).

Post-war.—Troops on occupation duty in the conquered enemy countries suffered a decline in morale when combat duties ceased and occupation duties began with insufficient instruction regarding the political significance of their work (*Amer. J. Psychiat.*, May). À propos of the war criminal trials, D. R. Taft urges that, since all criminals reflect both their own social experiences as well as their cultures, we should think less of punishing the criminals and think more of reducing international tensions (*Amer. Sociol. Rev.*, Aug.). The post-war training of clinical psychologists is following the medical internship program rather than the academic Ph.D. program (*J. Consult. Psych.*, July).

PERSONALITY

Guidance.—*People in Quandaries* (Harper), by W. Johnson, deals with the "semantics" of personal adjustment; the author strives to prevent the practice of "reckless adviseering" of the popular sort.

Types.—C. C. Seltzer found a greater frequency of personal stability and sensitivity and less amount of ability for social adjustment and integration in young men who possess such bodily disproportions as excessive height and thinness, wider hips than shoulders, and broad faces and narrow chests (*Psychosomat. Med.*, Apr.). J. A. Boynton says that prejudice shows up among individuals whose personalities are restricted in the growth of natural impulses and lacking in harmonious relationships with close associates (*J. Psych.*, July). H. Gray and J. B. Wheelwright believe that Jung's "psychological types" still represent a useful classification; these authors have devised a questionnaire for the speedy analysis of a type; they find that the "introvert-sensation-thinking" type is the most common (30 per cent) and the "extravert-intuitive-thinking" type least frequent (5 per cent) (*J. Gen. Psych.*, Jan.). A. Roe, in a study of the personality of artists, indicates a need for vocational adjustment of personality characteristics for particular vocations (*Educ. & Psychol. Meas.*, Winter).

Tests.—A projective test of personality, by A. R. Rhode, consists of sentence completions which reveal objective needs, emotional conflicts, and longings (*J. Appl. Psych.*, Apr.). Electroshocks evoke characteristic personality traits such as infantile regressions; the shocks, according to E. P. Mosse, release repressed emotions or libido (*J. Nerv. & Ment. Dis.*, Sept.). H. Grant has designed a rapid personality evaluation, based on the *Minnesota Multiphasic Personality Inventory,* consisting of ten statements for each of the following scales: validity, lie, depression, hysteria, psychopathic deviate, masculinity-femininity, paranoid, psychasthenia, schizoid, and hypochondriasis (*Amer J. Psychiat.*, July).

ABNORMAL

Principles.—F. Alexander *et al* collaborate in a summary of present-day *Psychoanalytic Therapy* (Ronald). J. H. Masserman presents the second in a series of books on *Principles of Dynamic Psychiatry* (Saunders); the present volume develops the corollaries to the author's four criteria of motivation, experimental adaptation, deviation and substitution, and conflict. S. Z. Orgel describes *Psychiatry, Today and Tomorrow* (*Internat. Univ.*). J. L. Moreno explains *Group Psychotherapy* (Beacon).

Treatment.—*Shock Treatment and Other Somatic Procedures in Psychiatry* (Grune & Stratton), by L. B. Kalinowski and P. H. Hoch, evaluates the results of physical therapies and lobotomies in treating the insane. D. H. Yates cites both case studies and experimental findings from the literature on conditioned responses to support the value of Jacobson's method of relaxation for psychotherapeutic purposes (*J. Genet. Psych.*, Apr.).

Feeblemindedness.—L. A. Lurie proposes that the medical concept of feeblemindedness ought to be that of "a symptom underlying constitutional disturbances which may be remediable" rather than that it be regarded as a clinical entity with an overemphasis on social adequacy (*Amer. J. Ment. Deficiency,* April). Among recent advances in the application of medicine to mental deficiency is the emphasis upon proper nutrition during pregnancy; for example, much of the commercialized emphasis upon vitamins is confirmed by medical research; another example is the prevention of post-infectional deficiencies by the use of sulpha drugs and penicillin: W. G. Murray (*ibid.*, Jan.). From an analysis of 100 cases of epilepsy, O. Marburg and M. Helford conclude that this affliction is caused by head injuries oftener than has been supposed; the authors claim that this factor is more important than heredity (*J. Nerv. & Ment. Dis.*, Nov.).

Adjustment.—P. M. Symonds discusses in *The Dynamics of Human Adjustment* (Appleton-Century) the problems of drive, frustration, anxiety, defense, fantasy, love, the meaning of normality, and the techniques of dynamic treatment. K. Dunlap in *Personal Adjustment* (McGraw-Hill) describes the present-day methods of eliminating maladjustments.

Institutional Practices.—In an editorial in *Mental Hygiene* (July), the recent popular attacks on the conditions in mental hospitals are supported and the need for improvements is confirmed, but it is pointed out that the principal defect is in the general system of institutionalized care which ignores the causes and the beginnings of mental illness in the community. L. S. Kubie shows a way to break the bottleneck in the rehabilitation of war cases of mental illness; the need is for training more psychiatrists; the permanent illness of one veteran costs the taxpayer $40,000 whereas the training of one psychiatrist costs $25,000 (*Amer. J. Orthopsychiat.*, July). R. A. Clark and A. H. Baldinger describe a seminar for theology students, including a study of psychiatry, mental hygiene, and social phenomena, such as cultisms (*Ment. Hyg.*, Jan.). L. W. Fitzsimmons offers a simple *Textbook for Psychiatric Attendants* (Macmillan) to promote better morale and understanding.

SOCIAL

Public Opinion.—H. C. Link has drawn a summary of the Psychological Corporation's Index of Public Opinion on such subjects as the possibility of another war (*J. Appl. Psych.*, Aug.). B. L. Smith *et al* have prepared a comprehensive reference guide on *Propaganda, Communication, and Public Opinion* (Princeton Univ.). An extended discussion, including criticisms and rebuttals on the subject of "opinion-attitude measurement" by Q. McNemar and others, is to be found in the July and November issues of the *Psychological Bulletin*. R. N. McMurray has verified a surmise that employee opinion polls are favorably received by union members wherever the workers have confidence in the company (*J. Appl. Psych.*, June).

Attitudes.—G. W. Allport and B. M. Kramer point to some roots of social prejudice which include: lack of awareness of one's own prejudices, unpleasant childhood experiences and instruction, neurotic fears and suspicions, and non-scientific fields of interest (*J. Psych.*, July). Persons with a favorable attitude toward Russia have a significantly greater desire for freedom and new experience, according to G. H. Smith (*ibid.*, Jan.). Attitudinal changes during military service were measured by a questionnaire in which the subject responded with "more" or "less" or "no change" to such questions as, "Do you have more and wider interests now than you used to, or are your interests less wide?" H. M. Hildreth (*Educ. & Psych. Meas.*, Autumn). G. H. Seward's *Sex and the Social Order* (McGraw-Hill) deals with the social attitudes and adjustments of the sexes in war and peace.

Race.—Up to the present time there continues in industry to be a racial intolerance in the informal social groups working on the same job; and the only way that management can give security to members of rejected races is to give them an opportunity for individual effort (*Amer. Sociol. Rev.*, Oct.). F. H. Lund and W. C. Berg demonstrate that, in American-born children, it is possible on the basis of physical appearance alone to identify the national family origin to a better than chance degree; speech is less distinctive (*J. Soc. Psych.*, Oct.).

Religion.—In a symposium upon the contributions of psychology to religious education, E. M. Ligon stresses the aspects of character education which have received psychological study; precautions in the cultivation of feelings of guilt have been recommended; careful measuring instruments of attitude and belief have been constructed; respect for the basic fact of individual differences has been urged; the dynamics of motivation has been brought out (*Relig. Educ.*, Oct.). K. Dunlap depicts religion as a product of man's mental processes; the genetic development is stressed in his book, *Religion:*

Its Functions in Human Life (McGraw-Hill).

Industrial.—N. R. F. Maier's *Psychology in Industry* (Houghton Mifflin) surveys the most recent tests, personnel techniques, and safety devices, based on the human element in industry. E. G. and C. W. Flemming explain how the selection of salesmen by psychological tests can be improved if the combined scores of tests by Bernreuter, Moss, Washburne, Otis, Caufield, and Strong be used; these correlate plus 80.6 with the records of 348 salesmen (*J. Psych.*, Jan.).

Education.—J. I. Mursell's *Successful Teaching—Its Psychological Principles* (McGraw-Hill) emphasizes the importance of socialization in the classroom. In a study by S. L. Pressey it is seen that younger college graduates are more successful in life than are those who graduate at an older age (*J. Appl. Psych.*, June).

CHILD PSYCHOLOGY

Development.—L. P. Thorpe reviews the experimental studies of children in his book, *Child Psychology and Development* (Ronald). The faculty of the University School at the Ohio State University have prepared a collaborated study entitled *How Children Develop* (Ohio State Univ.). B. L. Beverly's *A Psychology of Growth* (McGraw-Hill), especially designed for use by nurses, outlines the human growth processes. L. Carmichael is the editor of a *Manual of Child Psychology* (Wiley). A new summary of human genetics and eugenics has been compiled by R. Cook and B. S. Burks: *How Heredity Builds Our Lives* (Amer. Genet. Assoc.).

Group Study.—M. C. Erickson finds systematic class differences in the training of children of different social status; for example, children of middle class families are taught to assume responsibility early and consequently encounter more frustrations than do children of lower class families (*Amer. J. Sociol.*, Nov.). Observations on *The Adolescent in Social Groups* (Stanford Univ.) have been gathered by F. B. Newman.

Therapy.—A new periodical, *The Journal of Child Psychiatry*, edited by E. Harms, C. M. Louttit, L. Kanner, and others, appeared in 1946. A psychiatrist's consideration of behavior problems in children should include the following six syndromes: the defiant child, the overinhibited child, the unsocialized, aggressive child, the socialized delinquent, the brain-injured child, and the schizoid child; consistent clusters of symptoms have been found at the Chicago Institute for Juvenile Research for these traits (*Amer. J. Orthopsychiat.*, Apr.). E. F. Robinson gives a detailed description of the play of children with dolls, and presents a careful diagnosis of the significance of the emotional aspects of their play, especially the aggressive aspects, which were more strongly and selectively exhibited toward groups of dolls which represented the child's actual family than toward standard sets of dolls (*Child Dev.* Sept.). According to L. W. Sontag, some of the significant psychosomatic aspects of the child's activities include: rapid growth causes continual modification of homeostasis; prenatal excessive fatigue of mother and also continuous excessive noise; "blood borne" anxieties; children 18 months old develop diarrhea, e.g., when mother is worried about her husband's participation in battle; so-called attention-getting devices of the child related to situations in which the parent exhibits undue concern (*The Nerv. Child*, Oct.).

PHYSIOLOGICAL

Drugs.—H. L. Freedman and M. J. Rockmore found that the use of marihuana produced marked difficulties in the emotional adjustment of 55 per cent of the addicts of this drug (*J. Clin. Psychopath.*, Apr.). A. R. Lindesmith disputes the claim that chimpanzees can become morphine addicts; the behavior of the animals who regularly receive the drug is similar to that of humans who are not addicts; true addiction requires a degree of intellectual development—perception and learning—possible only in man (*J. Comp. Psych.*, Apr.).

Electroencephalography. — E. H. Hsü has compiled a series of quantitative norms of the EEG of five significant syndromes: "slow activity," "epileptic," "psychomotor," "hyperventilation," and "fast activity," and pleads for a reference to such norms in the diagnosis of clinical findings (*J. Psych.*, Oct.). Emotions produce an electroencephalographic change characterized by spontaneous low voltage random high frequency patterns in the frontal lobes: R. Cohn (*J. Nerv. & Ment. Dis.*, Oct.).

Brain.—The post-rotational nystagmus in pigeons becomes impaired when the striate bodies of the brain are injured; apparently a continual neural flow, constituting a homeostasis, is interrupted: G. K. Yacorzynski (*Comp. Psych. Monog.*, Aug.). Sleep, as examined in rats, has been shown by W. J. H. Nauta, to be regulated by the hypothalamis: a preoptic region (a "sleep center") exerts an inhibitory influence over a caudal ("wake center") area of the hypothalamus (*J. Neurophysiol.*, July). D. H. Raab and H. W. Ades were able to establish auditory conditioned responses in cats with only the midbrain, and also with only the bulbar level intact (*Amer. J. Psych.*, Jan.).

Motor Patterns.—H. T. Griedanus describes some manifestations of sudden shift in action, especially observed in birds, from fighting to strutting, or preening, which are called "sparking-over actions," occurring presumably when the animal is faced with a conflict between incompatible impulses (*J. Comp. Psych.*, June). The "smile" has been traced ontogenetically by R. A. Spitz and K. M. Wolf who find that this facial expression appears or does not appear according to the normalcy of emotional relationships with the mother; the smile is a criterion of the normal inception of the infant's social relations (*Genet. Psych. Monog.*, Aug.). Blind persons are aided in their vocational adjustment by tests of motor skill: the blind make a better average score than do the seeing on motor tests; motivation is harder to establish in the blind because of the protected world in which they live; speed is relatively insignificant; emotional adjustment tests are needed in connection with the other vocational tests: M. K. Bauman (*J. Appl. Psych.*, April).

LEARNING

Conditions.—H. L. Kingsley's book on *The Nature and Conditions of Learning* (Prentice-Hall) gives particular emphasis to educational psychology; seven forms of learning are presented along with a course of suggested improvements in methods of learning. H. S. Tuttle calls attention to the growing volume of discussion of "two kinds of learning" which are to be treated as independent of each other: namely, "affective learning" and "cognitive learning"; the former is needed for social control (*J. Psych.*, Oct.). H. Woodrow says that the ability to learn depends on the specificity of the actions practiced (rather than upon general transferred effects) (*Psych. Rev.*, May). T. G. Alper distinguishes ego-involved behavior from task-involved behavior in the process of learning; he finds experimentally that the task-involved behavior is superior (*Amer. J. Psych.*, April). T. S. Krawiec demonstrated that the visual method of learning either nonsense syllables or nouns is superior to the auditory method of learning comparable material (*J. Gen. Psych.*, April).

Motivation.—Learning in rats is strongly influenced by the strength of the motivation, such as is procured by 12-, 24-, and 48-hour time intervals of hunger; M. M. Macduff found that, even though fewer trials are needed for learning a maze by the hungriest rats, still retention persists for a longer time afterward (*J. Comp. Psych.*, Aug.).

Conditioned Response.—K. S. Lashley and M. Wade deny the validity of Pavlov's theory that the generalization of conditioned responses is based upon some type of undetermined interaction of sensory nervous pathways (*Psych. Rev.*, March). The conditioning of vasomotor responses in humans is shown by L. A. Gottschalk to take place more readily in subjects who exhibit symptoms of autonomic nervous system imbalance; the subjects could not accurately introspect upon vascular changes which can be objectively recorded (*Psychosom. Med.*, Feb.).

ANIMAL PSYCHOLOGY

Adaptation Patterns. — Cockroaches relearn a maze better after periods of inactivity or rest than after intervening periods of enforced work, thus confirming the hypothesis that inhibition by intervening experience is the cause of forgetting: H. Minami and K. M. Dallenbach (*Amer. J. Psych.*, Jan.). H. C. Sharp *et al.* found that the electric shocks impair the performance of rats in a "reasoning" test consisting of generalized abstractions of maze patterns (*J. Psych.*, Oct.). A. O. England reports that timidity, as revealed in rats by purposive avoidance of electric shocks is more conspicuous in castrated rats and still more conspicuous in vitamin-B deficient animals than in normal rats (*J. Comp. Psych.*, Oct.). *Cats in a Puzzle Box* (Rinehart) is a monograph illustrated with motion picture stills of the ability of cats to solve problems of escaping from a variety of cages: E. R. Guthrie and G. P. Horton.

SENSATION

Vision.—Yet another theory of color vision is expounded by T. L Jahn who says that modern evidence indicates that the mechanism of vision involves Granit's wide-range "dominator" nerves and narrow range "modulator" nerves in various combinations of function, and will account for S. Hecht's data if these data be interpreted in terms of conscious color experience (*J. Opt. Soc. Amer.*, Oct.). J. Cohen, re-examining the process of color adaptation to prolonged visual stimulation, concludes that there is "a gradual but never complete loss of saturation, no change in hue, but an increase in intensity" (*Amer. J. Psych.*, Jan.). H. Foster, in comparing tests of color vision, finds that the Ishihara and Pseudo-Isochromatic plates are in close agreement with each other, while the Jensen test shows far less agreement with either of the other tests (*J. Appl. Psych.*, April).

Hearing.—M. Reymert and M. Rotman conclude that auditory acuity reaches its maximum between the ages of 13 to 15 years; visual acuity is best at 16 years (*J. Genet. Psych.*, June). Auditory sensitivity depends incidentally upon muscular tension, inter-sensory (especially visual) stimulation, and fatigue: L. D. Goodfellow (*J. Gen. Psych.*, July). Tonal memory is of high significance for musical ability, according to E. G. Bugg and L. Herpel (*ibid*). M. Rosenzweig reports that cats do not distinguish tones as well as do humans; after destruction of the so-called auditory cortex, the cats continue to exhibit auditory discrimination responses as well as before destruction (*Amer. J. Psych.*, Jan.).

Touch.—G. H. Bishop brings an up-to-date review of studies of the cutaneous senses and concludes that the concept of four distinct modalities is unjustified either in terms of conscious report, sense-organ structure, brain projection areas, or specificity of afferent impulses; the manner in which responses are aroused and adaptation occurs should be a significant basis of analysis; all parts of the sensory pathway have a useful function to perform (*Physiol. Rev.*, Jan. 1946). H. K. Beecher reports that of various battle wounds, 37 per cent caused no pain, 30 per cent slight pain, 16 per cent moderate pain, and 17 per cent bad pain; of abdominal injuries, 14 per cent caused no pain, 18 per cent slight pain, 28 per cent moderate pain, and 48 per cent bad pain (*Bull. U. S. A. Med. Dept.*, May). E. Herz *et al.* report that a successful objective method of testing anaesthetic areas of the skin, owing to peripheral nerve injury, is that of mapping the electrical skin resistance; the unreliability of the introspections given by patients is thus eliminated (*Arch. Neurol. & Psychiat.*, Oct.).

Taste and Smell.—C. A. Moore and R. Elliott explored the taste receptors of birds and found a few taste buds on the tongues of some birds and none in other birds; the inference is that the tongue is not significant for the sense of taste in the earlier stages of evolution (*J. Comp. Psych.*, Apr.). T. C. Ruch and H. D. Patton locate the projection area for the sense of taste in the opercular region of the cortex (*Fed. Proc. Amer. Soc. Exper. Biol.*, Jan. 1946). In a factorial analysis of olfaction E. H. Hsü found a distinctive plant factor and an animal factor in addition to a hydrogen factor and a nitrogen factor (*Psychomet.*, Feb.).

Perception.—Reviewing studies in time perception, A. R. Gilliland *et al.* conclude that time estimation is not given as directly as is space perception, but the time sense is readily developed by training (*Psych. Bull.*, March). Young children develop a sense of time first with a concept of "now" at 18 months; "in a minute" at 21 months; "pretty soon" at 24 months; "morning" and "afternoon" at 30 months; "all the time" and "for two weeks" at 36 months; "month," "next summer" at 48 months; and the days of the week and age at next birthday at 60 months: L. B. Ames (*J. Genet. Psych.*, March). In perceiving incomplete pictures, young men and young women react more quickly and accurately than older men and older women; in general, men reacted more quickly than women; an excellent new set of 10 incomplete pictures was introduced by E. Verville and N. Cameron (*ibid.*, June).

HIGHER MENTAL PROCESSES

Reasoning.—M. Wertheimer's *Productive Thinking* (Harper) employs the principle of "insight" as used by the Gestalt psychology school. Problem solving by two-year-old children reveals the distinct functioning of substitutional reactions, negative responses, primitive reaching (toward goals), trial-and-error, and immediate (insight) solutions; individual differences in personality already play a large part in the ability to solve such problems as the devising of "tools" to be used in obtaining desirable objects placed out of reach: B. Ling (*J. Genet. Psych.*, March).

Symbols.—C. Morris integrates the aspects of communication and meaning in *Signs, Language and Behavior* (Prentice-Hall). H. Helson and H. B. Helson suggest that abstract thought consists of symbols structured into various designs out of which concrete thoughts may emerge in a manner similar to that in which graphic figures or designs appear within a complex geometric design viewed from various angles (*Amer. J. Psych.*, July).

Intelligence.—H. H. Goddard, nearly 40 years after introducing the Binet Intelligence Test to America, now defines intelligence as "availability" of effective responses and "anticipation" of immanent problems (*J. Soc. Psych.*, Aug.). D. O. Hebb and K. Williams have designed a new method of rating animal intelligence: an enclosed field-elevated maze is used as the basis for making comparisons between various animals (*J. Gen. Psych.*, Jan.). H. Guetzkow and J. Brozek find that deprivation of B-Complex vitamins cause almost no deterioration in higher intellectual functions or in the rate of learning (*Amer. J. Psych.*, July).

AFFECTION

Emotion.—Anxiety, caused by heart trouble, is largely owing to a general overactivity of the autonomic nervous system, writes L. Hess (*J. Nerv. & Ment. Dis.*, Nov.). A. Lefford reports that, in thinking out logical syllogisms which are concerned with controversial matters, the arousal of feeling responses is likely; for example, a controversial syllogism, such as "All Communists believe in trade unions; therefore, all trade unionists are Communists," is not as accurately solved as a neutral proposition, such as, "All whales live in water; and all fish live in water too;

therefore, all fish must be whales" (*J. Gen. Psych.*, April). D. O. Herb portrays the nature of fear as consisting of spontaneous (unlearned) reactions when the physiological cerebral processes are disrupted (*Psych. Rev.*, Sept.). O. H. Mowrer and R. R. Lamoreaux assert that fear is distinct from the process of avoidance reactions in animal subjects; fear itself is the result of learning, and can not therefore be regarded as a basis for explaining further learning (*J. Comp. Psych.*, Feb.). J. L. Despert and H. O. Pierce claim that increases in I. Q. of 10 to 31 points were developed in children who were successfully relieved of neurotic ailments (*Genet. Psych. Monog.*, Aug.).

Aesthetics.—The relation of aesthetic appeal to efficiency in work is dealt with in the book, *Music and Sound Systems in Industry* (McGraw-Hill) by B. E. Benson. L. Zucker treats "speech-melody" as an affective aspect of language: much of the unhappiness of transplanted races is owing to the "funny" sound of their efforts to speak the local language of their new environment (*J. Soc. Psych.*, Feb.). In an extensive bibliographical research upon the use of color in literature, S. Skard discloses the existence of highly divergent concepts of color, both between national groups and between periods of artistic style (*Proc. Amer. Philos. Soc.*, July).

PHILOSOPHY

By Ledger Wood

Associate Professor, Princeton University

GENERAL

The year 1946 was characterized by a considerable expansion of philosophical activity both in volume of literary production and in the number of conferences and meetings. The literature of the year covered a wide variety and range of topics both on the application of philosophical techniques to problems of culture, history and education, and in the purely technical disciplines of metaphysics and the theory of knowledge.

PHILOSOPHY AND CULTURAL SYNTHESIS

The recognition that war is, at least in part, the expression of ideological conflict between diverse cultures, has imposed upon philosophers the urgent obligation of analyzing the philosophical issues underlying cultural conflict and of seeking to effect a cultural synthesis at the philosophical level.

The most ambitious and responsible effort at cultural synthesis to emerge since the war is Prof. F. S. C. Northrup's *The Meeting of East and West: An Inquiry Concerning World Understanding* (Macmillan). "The time has come," warns Professor Northrup in his preface, "when these ideological conflicts must be faced and if possible resolved" (ix) and, he adds: "Because the basic problem turns out to be philosophical in character, its solution provides a philosophy of culture." The author does not claim that philosophical and ideological conflict is the sole source of cultural antagonism but states: "It is maintained, however . . . that these ideological factors are very important in the total situation —much more important than most people suppose, and that any approach to the issues of war and peace which neglects them does not face the full complexity of the difficulties confronting our world, and to that extent is doomed to failure . . ." (p. 13).

The democratic conception of a society of free and autonomous individuals is traced to its philosophical source in the Newtonian world-scheme and the Lockean philosophy. "In the modern Newtonian and Lockean theory the conception of those two factors is clear. Nature is a set of material substances located in infinitely extended Euclidean space. A person is a single atomic mental substance . . . consequently, the individual person is absolutely free and independent" (p. 93). In sharp contrast to the individualism of the democratic tradition is German political authoritarianism which reflects the Absolute idealism of post-Kantian philosophy in Germany. "To understand the Germans of our time is to realize that their culture was built predominantly on Fichte and Hegel, as Anglo-American culture has rested on Locke, Hume and Aristotle" (p. 214). The philosophical affiliations of communism are, of course, with the German rather than the English philosophers. "The primary thing to remember here is that the Marxian attitude is precisely that of the post-Kantian Hegelians. . . . With Hegel and Marx modern society passed on to a higher synthesis in which democratic societies grounded in the philosophy of Locke and Hume are definitely outmoded" (p. 239). Northrup doubtless overstates his ideological theory of culture when he asserts that "Russia is what it is today not because there is any necessity that it be that way, but largely because, for the reasons indicated, the leaders of the Russian revolution took the speculative philosophical theory of Marx, and by persuasive and forceful means brought others to its acceptance, and built political action and cultural institutions in terms of it" (p. 246. This entire sentence is in italics).

Professor Northrup's philosophical resolution of the cultural conflicts of our time obviously can not be adequately summarized, and it will perhaps be wisest to reproduce the exact words of Northrup's final solution, while referring the reader to Chapter XII for the elucidation of its meaning: "The answer to the basic problem underlying the ideological issues of these times is, therefore, as follows: *the aesthetic, intuitive, purely empirically given component in man and nature is related to the theoretically designated and indirectly verified* component, not as traditional modern Western science and philosophy suppose, by a three-termed relation of appearance, but instead *by the two-termed relation of epistemic correlation*" (p. 443, author's italics).

Another recent application of philosophy to the problem of cultural conflict is found in *"Plato's Theory of Man: An Introduction to the Realistic Philosophy of Culture* by John Wild (Harvard Univ. Press). The agreement between the two books is confined to the initial belief in the centrality of philosophy in the resolution of the cultural conflicts of the present age. Professor Wild seeks to accomplish two distinct, but for him, closely related tasks: the first, an examination of the Platonic conception of human nature and human culture, and the second the diagnosis of the crisis of modern culture. The philosophical context of the Platonic theory of man was an ontological hierarchy culminating in God. Present-day democracy is confronted with cultural crises in which it must choose between control by rational authority (the Platonic ideal) and control by irrational tyranny (the Nazi ideal). If, as Professor Wild claims, modern man is confronted with the choice between these two forms of authoritarianism—albeit one of them is rational—the future of democracy is gloomy indeed.

The interplay between philosophy and culture, so strikingly, though tragically, exemplified in the Nazis' propagandistic exploitation of Rosenberg's philosophy of Nordic culture is the subject of Prof. Albert R. Chandler's *Rosenberg's Nazi Myth* (Cornell Univ. Press). Alfred Rosenberg's *Der Mythus des 20 Jahrhunderts* (Munich, 1930) untranslated into English, exerted an influence on the Nazi mind second only to Hitler's *Mein Kampf*. The term "Mythus" of the title was not used by Rosenberg to suggest that the doctrines of Nordic superiority are false but useful political fictions. A "myth" is an intuitive truth superior to common sense and science. Professor Chandler describes Rosenberg's works as "eloquent partisan propaganda, dressed up in voluminous but uncritical erudition" (p. 6); he devotes most of his attention to the propagandistic features of the work, because as a philosophical production he finds it undeserving of serious consideration.

PHILOSOPHY AND THE PROBLEMS OF PEACE

Prof. Glenn R. Morrow, in opening the symposium on "The Distinctive Contribution of Philosophy to the Issues of the Peace" at the annual meeting of the Eastern Division of the American Philosophical Association, asked the question: What can philosophy contribute to the stabilization and maintenance of peace in the world? In his own reply to the problem he defined the task of philosophy as the creation of a "climate of mutual understanding by clarifying and universalizing our ends, by loosening the hold of national prejudices, by broadening the range of our sympathies and imaginations, and by centering our attention upon the purposes in which we are united, rather than on the traditions and dogmas that divide us" (*Journal of Philosophy,* Vol. XLIII, pp. 72-3). More specifically, he stated that the issues between Russia and the Atlantic nations are "less material than psychological and ideological." The ideological differences are not insurmountable, since there is basic ideological agreement between "communism" and "democracy" in their belief in the extension of the opportunities of education and enlightenment to all members of society and the conviction that science and technology should be applied to "the enrichment of the life of the common man."

Prof. R. B. Perry enumerated among the philosopher's possible contributions to world peace an attitude of mind which promotes disinterestedness and magnanimity; the creation of ideas and ideologies which may be causally effective in fostering peace; a critical attitude which destroys the effectiveness of "bad" propaganda; and a moral consciousness which should help to achieve the aims of peace.

THE PHILOSOPHY OF EDUCATION

The revision of the curricula in the institutions of higher learning throughout the country has stimulated philosophers to scrutinize the philosophical issues underlying the conflicting educational schemes. Unquestionably certain features of the new programs of higher education are traditionalist and stem philosophically from Scholasticism, but more liberal and progressive tendencies in education which find the philosophical basis of educational theory in pragmatism and experimentalism, have not been without their strong advocates. The lines of battle between the traditionalists and the experimentalists have been sharply drawn and the conflict is carried on with ever increasing vigor.

Sidney Hook, in his recent book, *Education for Modern Man* (Dial Press), plausibly argues that a sound philosophy of education is indispensable in the reform of our higher educational system. He clearly defines the issues between the traditionalist and the experimentalist theories and makes out a strong case for the conception of education advanced in Dewey's *Democracy and Education.*

Under the challenging title, *The Authoritarian Attempt to Capture Education* (New York, King's Crown Press, 1945), John Dewey, Arthur E. Murphy, Irwin Edman, Bruce Bliven, and 28 other participants in the Second Conference on the Scientific Spirit and Democratic Faith, present vigorous arguments for liberalism against the new traditionalism.

The more liberal and experimentalist philosophy of education is also well represented in "A Symposium on Educational Philosophy," published in *Philosophy and Phenomenological Research* (Vol. VII, 2, pp. 187-293) which consists of the following papers: "Philosophical Aspects of the Recent Harvard Report on Education," by Raphael Demos; "Synthesis or Eclecticism," by Sidney Hook; "Philosophical Aspects of the Harvard Report," by Harold Taylor; "Freedom and Responsibility in Education," by Claude E. Puffer; "Education and Its Modifiers," by Horace M. Kallen and "Reply," by Raphael Demos.

PHILOSOPHY OF BUSINESS

In a book entitled *Philosophy of Business,* by Rupert C. Lodge (Univ. of Chicago Press), the author undertakes the novel task of interpreting philosophy to the business man. He describes his project as "the first systematic attempt to think out a *Philosophy of Business* and, in so doing, to bring together two sides of human experience which have been growing rather far apart, namely, the academic speculations of philosophers and the practical reflections of businessmen" (v). The author distinguishes three basic types of philosophy—realism, idealism and pragmatism—and delineates the business policies and attitudes fostered by each type of philosophy. All three types of philosophy have their counterparts in business but pragmatism seems to harmonize best with the American type of economy.

THE NATURE AND FUNCTION OF METAPHYSICS

Signs of the revival of interest in metaphysics are apparent in recent attempts to redefine the methods, the criteria, and the function of metaphysics. The eclipse of metaphysics during the pre-war period was owing in large measure to the anti-metaphysical implications of logical positivism. Extreme positivism sought to discredit metaphysics in its entirety by showing that metaphysical statements are meaningless nonsense because they are empirically unverifiable. The positivist regarded metaphysics as a pretentious pseudo-science consisting entirely of emotive propositions devoid of cognitive significance. The positivistic critique of metaphysics has exerted a salutary influence on philosophy, since a large part of traditional metaphysics was sheer edification having no more cognitive worth than poetry. The present revival of metaphysics, taking cognizance of the positivistic critique by thoroughly examining the methods and criteria and presuppositions of metaphysical enquiry, is proceeding along the following diverse lines: (1) admitting that *most* traditional metaphysics is meaningless, if judged by strict empirical and positivistic criteria of the meaningful, *some* metaphysical statements can meet the most rigid standards of meaningfulness and truth; (2) metaphysics has its own distinctive empirical method. irreducible to the restricted empiricism of the factual sciences; thus metaphysics is conversant with domains of experience: for example the religious and other forms of value-experience, which transcend the domain of sensory fact; (3) the function of metaphysics is the formulation of comprehensive world-schemes, which, though not factually meaningful, have cognitive significance in the organization of knowledge.

A recent criticism of Logical Positivism from the point of view of Critical Realism is found in an article by Roy Wood Sellars, entitled "Positivism and Materialism" (*Philosophy and Phenomenological Research,* Vol. VII, 1, pp. 12-41). Professor Sellars, while sympathetic to certain aspects of empirical positivism, directs his attack against their phenomenalism. "It is my thesis," he says, "that physical things, in the quite literal meaning of that term, that is, the realistic meaning are observable *through* sensory data and that we can make confirmable statements about their structure, probably endurance, and behavior" (*Philosophy and Phenomenological Research,* Vol. VII, 1, p. 23).

Among the indications of a revolt against the violently anti-metaphysical tendencies of logical positivism in its earlier formulations is the recognition even among writers who are positivistically oriented of the significance of metaphysics. E. T. Mitchell in an article on "Metaphysics and Science" (*Philosophy of Science,* Vol. III, 4, pp. 274-280) writes: "Mainly metaphysical speculation differs from scientific hypothesis in scope" (p. 274) and concludes his article with the statement: "Metaphysical speculation serves an essential function in the intellectual enterprise and in personal and social action. If metaphysics were buried by philosophers it would rise again among scientists and laymen" (p. 280). In an article in the same issue of *Philosophy of Science*, David L. Miller similarly contends that metaphysics makes an essential contribution to the methodology of science and to an understanding of the wider implications of science: "Metaphysics; in speculation, is guided by phenomena in physics, and is never unrelated to phenomena. Yet such speculation always goes beyond phenomena in an attempt to complete the physical system" (p. 282).

One of the features of the forty-second Annual Meeting of the Eastern Division of the American Philosophical Association, held at Sarah Lawrence College, Feb. 21-23, 1946, was a symposium on "Metaphysics. Its Function, Consequences, and Criteria." Prof. W. E. Hocking, the first speaker, advocated the synoptic definition of metaphysics "as the systematic effort to know the real and the whole." The real, he defined as "independent being on which other things depend." Whereas the task of science is empirical and descriptive, the task of science is explanatory. "The problem of explanation involves the recognition of necessity, and is dialectical in method" (*The Journal of Philosophy,* Vol. XLIII, 3, p. 62; also Vol. XLIII, 15, esp. pp. 371-78).

Prof. Sterling P. Lamprecht, in the same symposium, while acknowledging the value of the synoptic definition as an ideal of the unity of all knowledge, questioned its realizability. He proposed a more modest conception of metaphysics as a problematic and hypothetical science "which seeks to formulate, in terms that will apply to any and everything which exists, the meaning of cause and effect, the sense in which the course of events is both determined and contingent, the relation of causality and chance and contingency, the nature of law in the course of events, the relation of natural law to particular events which are said to 'obey' the law, the sense in which the existential order is teleological, the degree and kind of unity the world has, the relation of structure and function, the relation of actuality and potentiality, the meaning of becoming or of process, the status of mind in nature, etc." (*Journal of Philosophy,* Vol. XLIII, 3, pp. 63-4; also Vol. XLIII, 15, pp. 393-401.)

Prof. J. H. Randall, Jr. also repudiated the synoptic definition of metaphysics as the search for "the whole" or "the Real" and attacked as particularly vicious the traditional definition of metaphysics as the science of reality as opposed to appearance. "The contrast between reality and appearance is a distinction of value, not of existence. Everything encountered is somehow real; the significant question is not whether it is 'real' or not, but how and in what sense it is real" (*Journal of Philosophy,* Vol. XLIII, 3, p. 66; also Vol. XLIII, 15, p. 407). Professor Randall proposed a Deweyan reflective definition of the function of metaphysics as the "criticism of criticism," "the ground-map of the province of criticism." "The metaphysical analysis of any specific subject-matter is to be defined as a critical analysis of its distinctive traits, of the intellectual instruments or concepts for dealing with it, and of its implications for the nature of existence" (*Journal of Philosophy,* Vol. XLIII, 3, p. 67; also Vol. XLIII, 15, p. 411). Metaphysics does not possess a method *sui generis* but shares the empirical method of the sciences. "For the empirical metaphysician, his method is no different from the ordinary experimental methods of observation and tested generalization employed in any existential science, and his conclusions share in the probable and corrigible character of the findings of all experimental science" (*Journal of Philosophy,* Vol. XLIII, 3, p. 67).

THE HISTORY OF IDEAS

Investigation of the history of ideas, continues as one of the most absorbing interests of contemporary American philosophy. These studies in the history of ideas exemplify several divergent approaches to the history of ideas, each of which has its advocates among historians of ideas: (1) The narrowly intellectualistic approach, which sees in the history of ideas a dialectical development governed by the internal logic of the meanings of these ideas, an approach which stems largely from Hegel and which either ignores the influences on the history of thought of the social and cultural milieu or considers such influences accidental and negligible; (2) the narrowly socio-historical approach which considers the philosophical ideas as mere reflections and useful indices of the basic social technological and cultural forces operative in human history; (3) the narrowly philosophical approach which regards the history of philosophy as a mere repository for past philosophical ideas from which the creative philosopher may derive his inspiration and materials for his own constructive thought. Each of the approaches, in its exclusive version, is narrow and restrictive but there is a growing appreciation that a fruitful history of ideas may combine all three approaches and thus that the history of philosophy, when properly interpreted, presents strands of continuously developing ideas and concepts which are causally related to their socio-historical medium and which make a positive contribution to contemporary philosophical enterprise.

Prof. Abraham Edel, in a paper entitled "Levels of Meaning and the History of Ideas," distinguishes between a history of ideas which seeks to discern the immanent patterns in the development of an idea and a study of the genesis of an idea in its socio-historical matrix. Professor Edel's paper advocates an historical method which, though it stresses the causal nexus of the idea, does not preclude a consideration of its meaning and socio-historical significance. Prof. Paul Oskar Kristeller, in a paper on "The Philosophical Significance of the History of Thought," rejects the Hegelian extreme identification of philosophy and the history of philosophy, but insists that philosophical history *is* an integral part of philosophy (*Journal of Philosophy,* Vol. XLIII, 3, pp. 68-9). Prof. Philip P. Wiener attacks the extreme intellectualist who imputes the genetic fallacy and the errors of historicism to philosophers who advocate an historical method in philosophy and finds that "the cumulative continuity of the history of thought has currently significant methodological, epistemological, and cultural implications" (*Journal of Philosophy,* Vol. XLIII, 3, p. 69; the three papers of the symposium are published in full in the *Journal of the History of Ideas,* VII, 3). The catholicity of the three contributors who, though differing in emphasis, recognize the three-fold function of the history of ideas, is an encouraging sign in this important branch of philosophical-historical study.

ANTHROPOLOGY AND ETHNOLOGY

By Marian W. Smith
Department of Anthropology, Columbia University

EMPHASIS ON PACIFIC ISLAND AND ASIATIC CULTURES

It was noted in 1945 that the extensive demands of the war upon academic curricula in anthropology and ethnology had served to emphasize interest in Pacific Island and Asiatic cultures, and in the lives of the peoples of Europe. This interest has now become one of the major trends in modern anthropology.

Courses in Asiatic and European materials have increased in number, and an ever-increasing amount of research time is being devoted to these fields, earlier hardly recognized within the provenience of anthropology and ethnology. This new area of investigation in anthropology was foreshadowed by certain pioneer studies, but the application of anthropological methods to highly developed Asiatic and European civilizations, and the general acceptance of such research within the standard academic curricula, serves to cloud any previously held distinctions between primitive and advanced cultures. Social scientists in general, and anthropologists in particular, are working more and more in terms of a basic unity of mankind in respect to innate characteristics and to mental and cultural processes.

At the same time, there has been in anthropology a growing interest in the reexamination of basic theoretical considerations and an increasing awareness of the continuing value of the classic areas of investigation. Work in the so-called primitive field has not abated.

THE PRIMITIVE FIELD

The Arctic Institute of North America has expanded its work in Alaska, Canada, and Greenland. Margaret Lantis, for instance, returned to Nunivak Island to obtain additional information on the Eskimo there. A volume on the social culture has already appeared under the auspices of the American Philosophical Society, and a volume on ceremonialism is in press under the auspices of the American Ethnological Society.

The American Indian work has continued in all its previous branches and has shown a sustained interest in Latin America. Several volumes of the *Handbook of the Indians of South America* have been issued under the editorship of Julian H. Steward and the auspices of the Bureau of American Ethnology, Smithsonian Institution. The John Simon Guggenheim Memorial Foundation, which has awarded a series of fellowships each year since 1930 to artists, scholars, and scientists from certain Latin American countries, announced the extension of the program to Colombia, Ecuador, Paraguay, and Bolivia. Thirty fellowships were granted to citizens of Argentina, Brazil, Chile, Cuba, Mexico, and Uruguay in the fields of anthropology, music, art, medicine, chemistry, and history. The University of Chicago Library announced the publication, in the medium of microfilm, of a series of manuscripts on the ethnology and linguistics of Middle America embodying the major field work done in the area over the past 15 years. These manuscripts will not be published in other form.

There has been a pronounced revival in the field of primitive art. Beginning with an exhibit of "The Art of the Pacific" at the Museum of Modern Art, New York, a popular interest in primitive art has been paralleled by a growing attention to these materials on the part of the fine arts specialists. An *Outline Guide of Pacific Art* by Paul Wingert appeared and a similar outline of African Art is scheduled. Enthusiasm for this field is somewhat dampened by information received from abroad as to the total or partial destruction of irreplaceable collections of primitive art materials formerly housed in the great museums of Europe.

PHYSICAL ANTHROPOLOGY

Problems of race continued to be a matter of major concern to many anthropologists. Lectures and popular articles reiterated the sober facts of racial equality as opposed to prejudicial racism.

A Summer Session in Physical Anthropology was held in New York with headquarters at the School of Physicians and Surgeons and the Viking Fund. Sherwood Washburn, secretary of the American Association of Physical Anthropologists, and Paul Fejos were largely instrumental in inaugurating this program which promises to be repeated in the future. One immediate result was the publication of a *Yearbook of Physical Anthropology*, under the auspices of the Viking Fund, which reprinted key contributions in 1945 in physical anthropology and related fields.

ARCHAEOLOGY

Seven institutions cooperated with the Institute of Andean Research in an extensive archaeological expedition to the Virú Valley on the northern coast of Peru. These, with the personnel concerned were: the Bureau of American Ethnology (Gordon W. Willey and F. Webster McBryde), Institute of Social Anthropology of the Smithsonian Institution (Julian H. Steward), Columbia University (William Duncan Strong, James A. Ford, and Clifford Evans), Yale University (Wendell C. Bennett), American Museum of Natural History (Junius Bird), Instituto de Estudios Etnológicos de Peru (Jorge Muelle). The valley is near the great ruins of Chanchan, and it is planned to augment the archaeological work with sociological work within the present valley population.

In addition to participation in the Virú Valley project the Chicago Natural History Museum had an expedition working on a Mogollon site in New Mexico under the direction of Paul S. Martin. The University of New Mexico Sixteenth Annual Field Session program under the direction of Paul Reiter worked at a surface site and a cave site just outside of Albuquerque. Senior members of the same program undertook limited excavation in caves near the Mexican border in western New Mexico.

The United Fruit Company began a five-year project of archaeological research in the Guatemalan Highlands which aims at the excavation and restoration of some of the late and relatively well-preserved ruins. Operations are under the direction of John M. Dimick, and A. V. Kidder is acting in an advisory capacity for the company.

L. J. Giddings, Jr. spent the summer collecting tree-ring material in the arctic for the University of Alaska and Douglas Leechman of the National Museum of Canada spent a season on the upper Yukon and Porcupine Rivers. The University of Washington conducted a field course in archaeology in the San Juan Islands under the direction of Arden R. King. The John Day region of north central Oregon was worked by the Oregon State Museum of Anthropology of the University of Oregon under L. S. Cressman.

The Robert S. Peabody Foundation for Archaeology, which excavated the famous Boylston Street fishweir in Boston, obtained additional material for analysis from the same sediments as revealed in a foundation excavation a short distance from the original site. Douglas S. Byers conducted a limited reconnaissance and sampling of shell heaps in Hancock County, Maine. The Rochester Museum of Arts and Sciences, in collaboration with the New York State Museum, sent a group under the direction of William A. Ritchie to Howland Island on the Seneca River, New York. The Cincinnati Museum of Natural History engaged in an exploration of a former Indian village site and cemetery one-half mile east of the Union Levee.

A group of 45 specialists in Southwestern archaeology met informally in August at the Laboratory of Anthropology at Santa Fé, continuing the tradition of the Pecos Conferences and Chaco Canyon Conferences. Dr. Emil W. Haury was elected chairman of the meeting and Katherine Bartlett, secretary. The discussions served to emphasize the growing tendency to integrate archaeological findings with other anthropological interests.

FOLKLORE

The Library of Congress established a Folklore Section within its Music Division. Dr. Duncan B. M. Emrich was made chief of the section and Mrs. Rae Korson, reference assistant. The section will perform reference and bibliographical functions and serve as custodian of recordings in its field of specialization, including the Archive of American Folk Song.

The second session of the Folklore Institute of America was held at Indiana University from June 19 to Aug. 16, 1946. The New Mexico Folklore Society, first organized in 1931, was formally reorganized as an active society at the University of New Mexico in May. In the same month the twelfth annual National

Folk Festival was held in Cleveland, and the Texas Folklore Society held its thirtieth annual meeting at Austin. The sixth annual Western Folklore Conference was held at the University of Denver.

The American Folklore Society established a Committee on Research in Folklore with Ann H. Gayton as chairman. The function of the committee will be to report upon work in progress in the field of folklore. In addition to itemizing numerous manuscript materials, the committee reports that six major collections of American Indian myth materials are now in press. The organ of the Hoosier Folklore Society, which had been previously mimeographed, is now being issued as a quarterly under the title of *Hoosier Folklore*. The editor is Ernest W. Baughman of Indiana University. The French Folklore Society's *Bulletin,* which previously appeared in photo-offset, is also now being published in printed form.

MEETINGS

The end of the war has seen a renewal of international relations in anthropology. The International Congress of the Anthropological and Ethnological Sciences, which last met in Copenhagen in 1938, was reconstituted by a meeting of the Permanent Council in April. Sessions were held in Oxford and later in London. A. L. Kroeber represented the United States, and delegates from 16 other countries were present. A conference on Peruvian archaeology was held at the Museo Rafael Larco Herrera, Hacienda Chiclín, in August, for the promotion of greater intellectual exchange and cooperation between Peruvian and North American scholars.

The forty-fifth annual meeting of the American Anthropological Association was held at the Palmer House in Chicago Dec. 27-31 in conjunction with the American Association of Physical Anthropologists, the American Folklore Society, Linguistic Society of America, Society for Applied Anthropology, and Society for American Archaeology. Symposia on Africa and early man were featured. In addition to the scientific materials presented, the Committee on Reorganization of the American Anthropological Association offered a report of their year's work recommending certain constitutional changes.

The Linguistic Circle of New York, now in its second year, held monthly meetings with speakers from various related branches of linguistic studies. The American Ethnological Society and the Anthropological Section of the New York Academy of Sciences held frequent meetings with speakers at the American Museum of Natural History in New York; the Viking Fund held meetings in their own building in New York; and other organizations such as the Central States, Philadelphia and Washington branches of the American Anthropological Association, and university groups, held important meetings of a similar nature throughout the country. One feature which emerged at these meetings was the increasing emphasis upon the use of visual materials, including motion pictures.

The Anthropological Section of the American Association for the Advancement of Science met with other sections and affiliated societies of the Association in Boston Dec. 26-31. One of the anthropological sessions was devoted to a relatively new field, that of economic anthropology, which was approached from modern American Indian and Japanese materials and considered in the light of theory and method.

THE HUMANITIES

DIVISION XXV

LITERATURE AND LANGUAGE

FICTION

By MAY LAMBERTON BECKER
READER'S GUIDE, *New York Herald Tribune*

PRIZES AND AWARDS

The decision of the Pulitzer Prize committee, announced in 1946, to award no fiction prize for 1945 was received not only without strong protest but, apart from commercial interests concerned, with something approaching satisfaction. All that could be said for that period was that a level of competent mediocrity was well maintained, and not much more.

The lesser prizes of the year were thoughtfully awarded: the significant Harper prize went to *Wasteland*, by Jo Sinclair, the pseudonym of Ruth Seid, a character study of a news photographer, revealed in talks in a psychoanalysis office, of a situation and a state of mind tragically familiar to those concerned with the problems of a racial minority. The interest now being taken among thoughtful Americans in any feature of this general problem was reflected in the award of the Intercollegiate Prize to Karon Kehoe's *City in the Sun,* a novel of a Japanese family and its surroundings in an Arizona relocation center. The League of American Penwomen gave its prize to *This Side of Innocence,* a best-seller by Taylor Caldwell.

The Southern Authors' Award which has previously gone to books of the caliber of Richard Wright's *Black Boy,* Harnett Kane's *Plantation Parade,* and Robert Molloy's *Pride's Way,* having led off with *Gone With the Wind,* maintained its judgment this year by choosing Josephine Pinckney's Charleston novel, *Three O'Clock Dinner.* Another Southern region, Kentucky coal-mining country, appeared in *Tomorrow Achieved,* by William R. Furr, winning the Chapman Prize for a novel of contemporary life, and the prize annually offered by *Red Book Magazine* in collaboration with Dodd, Mead, was won by Loula Grace Erdman's *Years of the Locust,* which takes place in a small Midwestern community. The Doubleday Prize went to *Before the Sun Goes Down,* by Elizabeth Metzger Howard.

BESTSELLERS

Among the bestsellers whose popularity kept up throughout the year was a satirical attack on the radio-advertising business, Frederick Wakeman's *The Hucksters,* whose success was largely owing to the surcharged state of popular feeling on this subject. J. P. Marquand's *B.F.'s Daughter,* coming late in the season, went at once to the head of the sales column, largely on the cumulative effect of his earlier novels; its post-war fatigue and pervading sense of aimlessness after the let-down of artificial heroics, make it a disquieting document of its time. The state of mind in Arthur Koestler's *Thieves in the Night,* was that of the violent commotions of modern Palestine. *All the King's Men,* by Robert Penn Warren, drove its way to general popularity by the sustained drive of its story of a Southern political boss—suggesting Huey Long—and won critical approval by the color and power of its presentation; it was an outstanding novel of the year. The third novel of the Flicka series, *Green Grass of Wyoming,* by Mary O'Hara, though complete in itself, revealed the series as really a three-part novel; its place in popular literature seems assured by its treatment of themes perennially beloved by the American reading public and too often worked out by formula, with originality and vitality. Conrad Richter's beautiful novel of the Ohio frontier, *The Trees,* (1940); goes on in its successor, *The Fields,* a distinguished addition to fictional treatment of early American history.

LITERATURE OF PROTEST

Later in the season the prosecution of Edmund Wilson's *Memoirs of Hecate County* made this collection of satiric short stories a center of controversy and aligned it with the "literature of protest" now being put forward by "intellectuals." The return of the word "intellectual" to something approaching everyday use is in itself a minor sign of the times. Granville Hicks, in *Small Town,* a faintly fictionized study of personal experience as resident in such a community, uses the word, "pretentious and dogmatic" as it is, apparently because it has taken on a meaning that fits the moment.

DREISER AND OTHERS

There was a posthumous novel about a Quaker family by Theodore Dreiser, *The Bulwark,* which will not add to his stature as an artist, and a good-natured addition to the works of William Saroyan, *The Adventures of Wesley Jackson.* Pearl Buck's *Pavilion of Women* maintained her standard in a study of life and love among cultured, comfortably situated Chinese. John T. Farrell made a minor addition to his output with *Bernard Clare.*

SHOLEM ASCH

Sholem Asch's *East River* belongs in a sense with his *Nazarene* and *Apostle,* a two-part New Testament masterpiece, and with his appeal to conscience in *One Destiny,* for, though it is a realistic novel, on the grand scale, of life on the East Side of New York City, it demonstrates in action the possibility of the voluntary merging, for that destiny, of the ideals of Christian and Jew.

NOVELS OF FAMILY LIFE

There have been several novels of earlier family life, in the predominant character of various regions, such as Mildred Walker's *The Quarry,* in Vermont, and *The Good Crop,* by Elizabeth Emerson, a large Quaker family in Eastern Illinois, from the Civil War period to the present.

NOVELS OF THE SEA

Though the nature of action and suspense in Jacland Marmur's *Andromeda* is due to desperate war conditions in the Pacific, this story of a tramp steamer and those on it has qualities well beyond that of a war thriller. *Mr. Roberts,* by Thomas Heggen, is a cargo-ship war story that also qualifies among stories of the sea.

REGIONAL AND HISTORICAL NOVELS

Holdfast Gaines, by Odell and Willard Shepard, returns to the tradition of long stretches of strenuous American history centering in a strong pioneer character. A novel of middle-distance history rapidly receding into the background of New York life is Marjorie Northington's *The House on the Park,* a turn of the century tale strong in the customs of the time among the well-to-do.

It could scarcely be expected that lighter fiction should neglect the possibilities of an atomic age: Pat Frank's *Mr. Adam,* treats with a type of humor that put the book at once on best-seller lists, the problem of what to do about the continuation of the human race. James Branch Cabell brought fantasy into history with the highly imaginative plot of *There Were Two Pirates,* purporting to be what happened to historic Spanish pirate Gasparilla before he became a ghost resident in St. Augustine, Florida. Christine Weston's *The Dark Wood,* a departure from her admirable *Indigo,* dealt with the psychological aftermath of war in lovers' lives. Among regional novels two stand out, Ruth Moore's *Spoonhandle,* for Maine, and for the Deep South, *Delta Wedding,* the first novel of the distinguished author of short stories, Eudora Welty.

SERIES FICTION AND OTHERS

Various series novels pursued their course. Inglis Fletcher's *Toil of the Brave,* fourth to take place in the Albemarle district of North Carolina; the Jalna novels of Mazo de la Roche reached the tenth volume in *Return to Jalna* with its public well in hand; and the fifth of the Hornblower series, C. S. Forester's historical thriller concluded Hornblower's adventures in the Napoleonic period with *Lord Hornblower.* A short novel of restrained power and true understanding, Mort Friedlander's *The Yellow Leaf,* took place in an old folks' home, and though Jerome Wechsberg's *Homecoming,* a work of the same length, is the story of the actual return of an American soldier to his war-wrecked home in Czechoslovakia, it employs in its narration so distinctive a technique of fiction that it may well be included in this survey. Another newcomer among the novelists made a most promising start with a study of youth, aggressive age, and solidified society in a small midwestern city, *The Charity Ball,* by Jessie Scott.

CLINICAL NOVELS

The Snake Pit, by Mary Jane Ward, a pseudonymous study of life in a mental hospital, dealt with the desperate struggle of the human spirit to retain identity in the midst of chaos. Another clinical novel, a first attempt, was *No Wind of Healing,* Dorothy Parker Kines' study of emotional problems in a tuberculosis sanitarium.

BRITISH FICTION IN AMERICA

Now that in respect to books the Atlantic is no longer, as in the past six years, a one-way street open only to military traffic, British fiction is once more represented on the publishing lists of America in greater variety than could be provided in wartime by a few established writers with a large public assured in advance. *The Fair Field,* by Robert Moore, a beautifully rounded story of a small English town as remembered through a far-flung lifetime, was received by a discriminating audience with the same enthusiasm it aroused in England as *Portrait of Elmbury.* George Orwell's *Animal Farm* showed in satire, more tolerant than bitter, how easy it would be for brutal dictatorship to make use of the ideals of democracy. T. H. White, whose modern treatment of Arthurian legend struck out a new path in an old field, gave an even more unusual handling to the descendants of the Lilliputians brought to buy land by Lemuel Gulliver, in the delicately satiric *Mistress Masham's Repose.* W. Somerset Maugham's *Then and Now* has for its hero Nicolo Macchiavelli; Kate O'Brien's *For One Sweet Grape* centers in Philip II of Spain and Ana de Mendoza; Bruce Marshall's *Yellow Tapers for Paris,* is a realistic, sympathetic presentation of pre-war spiritual disintegration. Barbara Fitzgerald's *We Are Besieged,* is the story of a minority group, a Protestant Unionist family in the Dublin of the 1920's. A. A. Milne's *Chloe Marr* attempted a new technique in the indirect presentation of a character through its effect on others. Two Yorkshire novelists did some of their best work in 1946: J. B. Priestley's *Bright Day,* true to the region's scene and character; Phyllis Bentley's *The Rise of Henry Morcar,* personality and problems of a successful self-made man, woven into the fabric of the wool trade which Miss Bentley has installed in British literature.

Rumer Godden's *The River,* is in Bengal, where a small child discovers life. Stella Gibbons' heroine in *The Gentle Powers* breaks away from small town life into artistic circles of post-war London. Barbara Noble's *Doreen* is a sensitive, sensible study of a slum child transplanted in wartime evacuation. In Stephen Bagnall's *The Crater's Edge,* a wounded man lying in a shell crater lives through the loves of his life. Angela Thirkell's *Miss Bunting* uses the same milieu and methods that have endeared her to so many Americans. Nancy Mitford's comedy of manners, *The Pursuit of Love,* proved that light fiction need not be light-weight; so did Eric Linklater's *Private Angelo.* In G. B. Stern's *The Reasonable Shores,* a charming, tenacious parasite conditions life for his family circle. Nigel Balchin's dramatic *Mine Own Executioner,* involves psychiatry. Evelyn Waugh's *Brideshead Revisited* is a story of a wealthy Roman Catholic family between the two world wars.

The American following of C. S. Lewis, steadily and rapidly increasing since *The Screwtape Letters,* was further augmented by *That Hideous Strength,* a fantasy of the type of his *Perelandia.* Margery Sharp, whose popularity has been hitherto based on the gayety of her romances, greatly increased it by *Britannia Mews,* a richly realized story of character developing solidly from Victorian ideals to the present in a steadily changing London.

THE SHORT STORY

The short story, whose publication in book form had been largely in abeyance during the war, returned in unusual strength. Stephen Vincent Benet's latest stories were collected in *The Last Circle,* a posthumous collection that shows no let-down from his high standards. Paul Green had another volume of stories of the South, *Salvation on a String,* and Jesse Stuart of mountain life in Kentucky, *Tales from the Plum Grove Hills.* Victoria Lincoln's *The Wind at My Back* included three novelettes concerned with childhood and youth. Edward Newhouse's *The Iron Chain* had 20 stories recording war's effect on the human spirit. Irwin Shaw's stories in *Act of Faith* reflected war with deep feeling. Kay Boyle made her own selection, including some long out of print, for her volume of *Thirty Stories.* James T. Farrell's *When Boyhood Dreams Come True* included a play written in collaboration with his wife. Minor incidents and keen appraisal characterized *Borrowed Summer* and other stories by Elizabeth Enright; *An Afternoon* by Elizabeth Parsons; and two collections from *The New Yorker, The Pleasure Was Mine,* by James Reid Parker, and *French Follies and Other Follies,* by Francis Steegmuller. The ironic insight of Rhys Davies distinguished his volume from overseas, *The Trip to London.*

POETRY

By August Derleth
Author and Editor

GENERAL

A slightly greater number of volumes and collections of poetry was published in America during 1946 than in the preceding war years. Several distinguished volumes dealing with poetry saw publication, among them *A History of American Poetry, 1900-1940,* by Horace Gregory and Marya Zaturenska (Harcourt); *William Blake: The Politics of Vision,* by Mark Schorer (Holt); and *The Nature of Poetry,* by Donald A. Stauffer (Norton). The Yale Younger Poets volume of the year was *Family Circle,* by Eve Merriam, with a foreword by Archibald MacLeish, and Eve Triem's *Parade of Doves* (Dutton) was the book award of the League to Support Poetry.

Various awards of the year in poetry were made. The Shelley Award went to Karl Shapiro, who was also named as Consultant in Poetry in English by the Library of Congress. The Harriet Monroe Prize was awarded to Wallace Stevens, and the Lola Ridge Awards were given to Jules Alan Wein and Sidney Shanker. Three poets were named Guggenheim Fellows: Randall Jarrell, Gwendolyn Brooks, and George Zabriskie. *Poetry*'s annual prizes were awarded in 1946 as follows: the Levinson Prize to John Ciardi; the Guarantors Prize to Richard Eberhart; the Young Poets Prize to John Nerber; the Harriet Monroe Lyric Prize to Patrick Anderson; the Edward Bland Memorial Fellowship Prize to John Manifold; the Eunice Tietjens Memorial Prize to Alfred Hayes; the First Appearance Prize to Douglas Newton.

ANTHOLOGIES

Unquestionably the most distinguished anthology of the year was *A Little Treasury of Modern Poetry,* edited by Oscar Williams (Scribner). It is a comprehensive, ably edited volume, which begins with Hopkins and ends with MacNeice; there is also an additional little "treasury" of modern light verse. Of particular interest also are the first *Poetry Society of America Anthology* (Fine Editions), with an introduction by J. Donald Adams, a volume exemplifying the wide variety of talent within the Society; *Dark of the Moon: Poems of Fantasy and the Macabre,* edited by August Derleth (Arkham), the first anthology of its kind in two decades; *The Winged Serpent,* an anthology of American Indian prose and poetry, edited by Margot Astrov (John Day). Of somewhat less importance, though entirely adequate within their boundaries, are *War and the Poet,* edited by Richard Eberhart and Selden Rodman (Devin-Adair); *1000 Years of Irish Poetry,* edited by Kathleen Hoagland (Devin-Adair); *Ted Malone's Adventures in Poetry* (Morrow); *All the Best Dog Poems,* edited by Edwin Burtis (Crowell); and the *Golden Book of Catholic Poetry,* edited by Alfred Noyes (Lippincott).

SELECTIONS AND COLLECTIONS

Few notable selections or collections saw publication in 1946. Perhaps the most interesting was a selection of the country poems of Mark Van Doren, published under the title of *The Country Year* (William Sloane Associates), with delightful illustrations by John O'Hara Cosgrave. Kenneth Patchen's *Selected Poems* (New Directions) revealed that, while Patchen can write extremely well, he is so given to high-jinks in typography as to be for all intent and purpose considerably short of poetic maturity. Dylan Thomas' *Selected Writings* (New Directions) contains a large body of notable poetry by a comparatively new poet who is too little known in America. Stephen Vincent Benét's *The Last Circle* (Farrar, Straus) contains both prose and poetry; though the poems are largely minor, they are still very fine. An adequate selection of Mayaskovsky's verse is afforded in *Mayaskovsky and His Poetry,* edited by Herbert Marshall (Transatlantic Arts), and the best of Lorca is included in *Selected Poems of Lorca,* translated by Stephen Spender and J. L. Gili (Transatlantic Arts). A new translation of *Petrarch's Sonnets and Songs* has been made by Anna Maria Armi (Pantheon).

Other selections or collections meriting the attention of discriminating readers include *Selected Poems,* by Raymond Holden (Holt); *The*

Bridge: Poems 1939-1944, by Ruth Pitter (Macmillan); *Poems: 1938-1945,* by Robert Graves (Creative Age); *Late Lark Singing,* by T. A. Daly (Harcourt); *Collected Poems,* by Theodore Maynard (Macmillan); and *Selected Verse,* by John Manifold (John Day).

LONG NARRATIVE VERSE

Four long narrative poems, each book-length, warrant attention. Each in its own way is distinguished, and one—William Carlos Williams' *Paterson,* Book I (New Directions)—long as it is, is but the beginning of what promises to be one of the longest poems ever written. As usual, Dr. Williams' poem, at times chaotic and uneven, as if written on different planes, is nevertheless commanding and well worthy of study. Norman Rosten's *The Big Road* (Rinehart) is perhaps the most provocative of the long narrative poems; it is a poem about the roads men have made in the progress of civilization, a poem about the Appian Way, the Alcan Highway, etc., done with considerably more power than was potential in Rosten's earlier, shorter work. *Man and Shadow,* by Alfred Kreymborg (Dutton), is an allegory of man's wanderings on the face of the earth. told in the portraits of characters met by a man wandering through New York's Central Park for a day. Kreymborg deliberates on the problems of society and mankind in readable verse. Finally, Helen Wolfert's *Nothing Is a Wonderful Thing* (Simon & Schuster) demands consideration, though it is perhaps less noteworthy than the other long narrative poems of the year.

FIRST BOOKS

Quite possibly the most exciting and distinguished first collection of 1946—though not technically his first, the young poet having had a limited edition of some of his poems published privately in 1945—is Robert Lowell's *Lord Weary's Castle* (Harcourt), a book of sharp, incisive poems, remarkable for their freshness of imagery, the vividness of Lowell's concepts, the mature mastery of form and idea which is evident. Martha Keller's *Brady's Bend and Other Ballads* (Rutgers) is a surprisingly good collection of poems in ballad form; though Miss Keller is far from at her best in her war poems, these comprise the minority of the book; her ballads are excellent. Among the experimentalists who have something to say and say it well, Lorine Neidecker's first book, *A New Goose* (Decker), is outstanding. *North and South,* by Elizabeth Bishop is the Houghton-Mifflin Poetry Prize book; it is very largely orthodox verse, but vivid and fresh and quite unmistakably the product of a strong new talent.

Brewster Ghiselin in *Against the Circle* (Dutton) says what he wishes to say in new idioms, but his verse somehow lacks the strength and force which it ought to have, and it is often too prolix, despite being well worthy of attention. Probably second only in vivid imagery to the verse of Robert Lowell, who is in the classic tradition, is the poetry of Byron Vazakas, in *Transfigured Night* (Macmillan), who is more modern in his treatment of his subjects, and, perhaps because of this, his poems will tend to impress quite apart from their shortcomings, all of which spring from immaturity. Together with the collections by Lowell and Vazakas, two other first books of poetry stand head and shoulders above the others; they are John Nerber's *The Spectre Image* (Simon & Schuster), and *The Earth-Bound,* a first collection by a distinguished master of prose, Janet Lewis (Wells College).

John Waller's *Crusade* (Macmillan) contains some of the best poetry to come out of this war, though Hargis Westerfield's first large collection, *Soldier Words* (Bruce Humphries), also contains some noteworthy, if uneven, war verse. Two first volumes in translation merit reading: *Secret Country,* by Jorge Carrera Andrade, translated by Muna Lee (Macmillan), and *Residence on Earth,* by Pablo Neruda (New Directions).

Among other first volumes, these will also reward reading: Edwina's delightful aphorisms in *Alec the Great* (Crown); *Initiate the Heart,* by Sister M. Maura (Macmillan); *Doomsdays' Cue,* by Robert Tallman (Doubleday); *Dr. Johnson's Waterfall,* by Helen Bevington (Houghton Mifflin), and *The Living Stone,* by Marion S. White (Coward-McCann); two amusing collections of light verse; *Lough Derg and Other Poems,* by Denis Devlin (Reynal & Hitchcock); *The Long Reprieve,* by Hubert Creekmore (New Directions), clearly the work of a sensitive young poet of decisive talent; *The Quiet Center,* by Edith Henrich (William Sloane Associates), simple, compact, refreshing poetry; *Poems from Several Wildernesses,* by Meade Harwell (Swallow); *A Clear Bell,* by Wightman Williams (Cummington); *Rockets in the Afternoon,* by Geoffrey Fitzgerald (Fine Editions); *The Northern Stranger,* by Lysander Kemp (Random); *For the Unlost,* by Josephine Jacobson (Contemporary Poetry); and *Powerful Long Ladder,* by Owen Dodson (Farrar, Straus).

NEW VOLUMES BY FAMILIAR POETS

The largest number of volumes of poetry published in 1946 was the work of poets long familiar to the American reading public. Books were published by the usually steady productive poets like Robert P. Tristram Coffin, whose *People Behave Like Ballads* (Macmillan) is in his usual, most readable vein; and *The Wind-Swept Harp,* by Grace Noll Crowell (Harper), which is no less than Mrs. Crowell's sixteenth collection of poems! Robinson Jeffers published a new, free adaptation of *Medea* (Random), and, after a long silence, Roy Helton again became memorably articulate in a new collection, *Come Back to Earth* (Harper), distinguished for its quiet strength and restraint.

All the poems written by John Gould Fletcher since his Pulitzer prize-winning selection in 1938 appeared in *The Burning Mountain* (Dutton). Edward Weismiller, one-time Yale Younger Poet, published *The Faultless Shore* (Houghton Mifflin), marking a definite advance in mastery of form over his initial volume, *The Deer Come Down,* though that earlier volume contained more graceful and memorable poems. Frances Frost, writing in the naturalist tradition, published *Mid-Century* (Creative Age), and August Derleth appeared with a new slim collection of love lyrics, *Habitant of Dusk: A Garland for Cassandra* (Walden Press). Objectivist Louis Zukofsky had his first collection in some time published by Decker under the title of *Anew,* but, by and large, 1946 was not a particularly good year for the experimentalists, only one other modern poet meriting attention—Ivan Goll, with *Fruit from Saturn* (Hemispheres Editions).

Perhaps the most laudable spiritual verse, strongly religious, was published in *A Man in a Divided Sea,* by the young religious, Thomas Merton (New Directions), a volume of almost classically distinguished poetry. Nancy Bruff's *My Talon in Your Heart* (Dutton), while much touted on the strength of a sex-ridden novel, was perhaps the year's poorest excuse for "poetry," though it was run a close second by the uneven work of Stanton A. Coblentz in *The Mountain of the Sleeping Maiden and Other Poems* (Mill Valley Press). Edith Sitwell's sprightly verse filled *Green Song* (Vanguard), and Seumas O'Sullivan's *Dublin Poems* (Creative Age) afforded ample variety, from the lighter side to the more thoughtful. Genevieve Taggard's *Slow Music* (Harper) is one of that poet's best collections, the result of much introspection, and gives evidence of some marked alteration in approach and poetic method. Still too little appreciated, Haniel Long published a new volume in 1946, *The Grist Mill* (Rydal Press), and Alan Swallow in *The Remembered Land* (Decker), provided convincing proof of his growing awareness and maturity. Josephine Miles, one of the most satisfactory of modern poets, and also one of the most skilled and careful writers, published *Local Measures* (Reynal & Hitchcock), and Richard Aldington appeared with *A Wreath for San Gemignano* (Duell, Sloan & Pearce).

Other collections of merit include *Spirit Level,* by Christopher Morley (Harvard Press), a first collection in some time by the urbane Morley; *The Garden,* by V. Sackville-West (Doubleday); *The Time Piece,* by Frank Kendon (Macmillan); *No Rain from These Clouds,* by Kenneth Porter (John Day); *The Feudalist,* by Woodridge Spears (Fine Editions); *Release the Lark,* by John Black (Fine Editions); *Freedom's Farm,* by Josephine Young Case (Harcourt); and *Stars and Atoms Have no Size,* by A. M. Sullivan (Dutton). The Dierkes Press Award book of 1946 was Joseph Joel Keith's *The Hearth Lit,* which, while not as strong as Keith's two preceding collections, still warrants reading. Few of the usual brochures and collections from the professional poetry publishers merited discriminating attention during 1946.

HISTORY

By Richard W. Leopold
Assistant Professor, Harvard University

PAUCITY OF HISTORICAL STUDIES

During 1946 American historiography continued to suffer, both quantitatively and qualitatively, from the effects of the war. Very few works merit extended special notice, while the number of worthwhile books remained far below the pre-war number. As usual, many of the best contributions were made in the field of biography.

The causes of this continuing depression in history are obvious. Research projects, interrupted by the war, have not yet been carried to completion. Specialists concerned with Europe and Asia are still cut off from source materials. College teachers returning from war service have been, along with their colleagues who remained at their posts, overwhelmed by heavy schedules imposed by swollen enrollments under the G. I. Bill of Rights. Finished manuscripts can not command prompt publication as book firms everywhere grapple with the problems of paper shortages, rising costs of printing, and previous commitments. Prospects for an early amelioration of these conditions are not bright.

WAR HISTORIES

The torrent of war volumes by participants, journalists, and ghost writers did not slacken in 1946, but the more scholarly works by trained historians have not yet appeared. It is possible that the ambitious historical enterprises of the armed forces and civilian agencies, previously noted in these pages, may be curtailed by the rapid demobilization, conflicting policies on security, and a diminution of popular interest. Still it is reasonable to hope that the story of the national effort in the Second World War will be more fully recorded than it was in the First World War. Basis for that hope can be found in J. P. Baxter III, *Scientists against Time* (Little, Brown), a clear but comprehensive account, intended for the intelligent layman, of the Office of Scientific Research and Development.

GENERAL WORKS

Of primary interest to historians is F. S. C. Northrop's *The Meeting of East and West* (Macmillan), a masterly comparative study of Eastern and Western cultures. M. R. Beard's *Woman as Force in History* (Macmillan) is a mature statement of a much-neglected subject. Wallace Notestein considers in an erudite but charming manner the interplay of national character and history in *The Scot in History* (Yale). The importance of Utopias is treated in A. E.

Morgan, *Nowhere Is Somewhere* (North Carolina). *The Story of the Faith* (Macmillan) by W. A. Gifford is subtitled "A Survey of Christian History for the Undogmatic." Two popular accounts of medical progress by Victor Robinson are *White Caps* (Lippincott), the story of nursing, and *Victory over Pain* (Henry Schuman), the story of anesthesia.

Every member of the historical guild should read *Theory and Practice of Historical Study* (Social Science Research Council), a group of essays by C. A. Beard and others devoted "to a fuller understanding of certain methodological problems in the writing of history."

UNITED STATES HISTORY

The most valuable contributions of a general nature dealt in 1946 with the influence of ideas. Joseph Dorfman's two volumes on *The Economic Mind in American Civilization, 1606-1865* (Viking) are the first installment of a larger study. Encyclopedic in character and prolix in style, it breaks new ground in many places. H. W. Schneider's *A History of American Philosophy* (Columbia) is less concerned with systematic expositions by American philosophers than with their views on democracy as a political form and a way of life. The story of American patriotism is competently told, with an emphasis on the years to 1876, in Merle Curti's *The Roots of American Loyalty* (Columbia). Two series of stimulating essays are E. E. Robinson's *The New United States* (Stanford) and C. McA. Destler's *American Radicalism, 1865-1901* (Connecticut College).

ILLUSTRATED HISTORIES

Further impetus was given during 1946 to the growing tendency to describe the American past by contemporary paintings, photographs, woodcuts, and engravings, accompanied by a minimum of textual comment. The third volume of the *Album of American History* (Scribner), edited by J. T. Adams and covering the years 1853-1893, is the most successful thus far. Roy Meredith, *Mr. Lincoln's Camera Man* (Scribner) is more than a biography of Mathew B. Brady; it is an indispensable tool for any treatment of the Civil War. Stefan Lorant's (ed.), *The New World* (Duell, Sloan and Pearce) reproduces as the first pictorial record sixteenth century water-colors of the Huguenot settlements in Florida and the Roanoke colony in Virginia. Bellamy Partridge and Otto Bettmann depict family life from 1850 to 1900 in *As We Were* (Whittlesey); *The Santa Fe Trail* (Random House), assembled by the editors of *Look* magazine, is a popular cavalcade of an important transcontinental road.

THE AMERICAN COLONIES

The sixth volume of L. H. Gipson's monumental but sometimes controversial panorama of the British Empire before the American Revolution is entitled *The Great War for the Empire* (Knopf) and deals with the years of defeat, 1754-1757. R. B. Morris' *Government and Labor in Early America* (Columbia) is a scholarly work that concentrates on the legal and social position of free and bound labor. *America, 1355-1364* (Duell, Sloan and Pearce) represents the latest investigations of H. R. Holand in the pre-Columbian era.

POLITICAL HISTORY

The ever popular Civil War is the subject of four books of varying merit. B. J. Hendrick's *Lincoln's War Cabinet* (Little, Brown) reworks familiar materials with such skill and unobtrusive scholarship as to stamp it an outstanding publication of the year. J. G. Randall's *Lincoln and the South* (Louisiana) is a brief synthesis by a leading Lincoln authority. A full sketch of the Confederacy is attempted in Clifford Dowdey's *Experiment in Rebellion* (Doubleday); while Richmond's checkered war history is traced in A. H. Bill, *The Beleaguered City* (Knopf).

G. E. Mowry, in *Theodore Roosevelt and the Progressive Movement* (Wisconsin), has exploited hitherto unused Roosevelt manuscripts. Less significant essays in political history are R. E. Noble's *New Jersey Progressivism before Wilson* (Princeton) and Marvin Wachman's *History of the Social-Democratic Party of Milwaukee, 1897-1910* (Illinois).

SOCIAL HISTORY

Various aspects of American society claimed the attention of historians in 1946. *Learning How to Behave* (Macmillan) by A. M. Schlesinger, a pioneer in this expanding field, contains a brief but illuminating discussion of the evolution of American manners as reflected in etiquette books.

Willard Sperry's *Religion in America* (Macmillan) is a short survey designed for English readers. Other phases of American religion are considered in E. C. Chorley's *Men and Movements in the American Episcopal Church* (Scribner); F. X. Curran's *Major Trends in American Church History* (America Press); and P. E. Shaw's *The Catholic Apostolic Church, Sometimes Called Irvingite* (Crown).

Developments in American education are reflected in Frank Aydelotte's *The American Rhodes Scholarships* (Princeton); J. T. Ellis' *The Formative Years of the Catholic University of America* (Catholic Historical Association); R. W. Hale, Jr.'s *Tercentenary History of the Roxbury Latin School* (Riverside Press); Barbara Jones' *Bennington College* (Harper); Thomas Le Duc's *Piety and Intellect at Amherst College, 1865-1912* (Columbia); O. M. Voorhees' *History of Phi Beta Kappa* (Crown); and T. J. Wertenbaker's *Princeton, 1746-1896* (Princeton), a readable survey prepared for that university's bicentennial celebration.

LITERARY TRENDS

Literary trends receive attention in Roger Burlingame's *Of Making Many Books* (Scribner), an account of 100 years of publishing by the house of Scribner; F. J. Hoffman, Charles Allen, and Carolyn Ulrich's *The Little Magazines* (Princeton), which rescues from oblivion some short-lived efforts of the 1920's; R. M. Dorson's *Jonathan Draws the Long Bow* (Harvard), a study in New England folklore; and in Horace Gregory and Marya Zaturenska's *A History of American Poetry, 1900-1940* (Harcourt, Brace). Music and the drama are the concern of Rudi Blesh's *Shining Trumpets: a History of Jazz* (Knopf); Raymond Morin's *The Worcester Music Festival, 1858-1946* (Worcester Music Festival); and W. S. Hoole's *The Ante-Bellum Charleston Theatre* (Alabama).

ARCHITECTURE AND MISCELLANEOUS THEMES

The history of American architecture has been enriched by T. T. Waterman's *The Mansions of Virginia, 1706-76* (North Carolina); Deering Davis, S. P. Dorsey, and R. C. Hall, in *Alexandria Houses, 1750-1830* (Architectural Book Publishing Co.); W. H. Kilham, in *Boston after Bulfinch* (Harvard), dealing with the Nineteenth Century; G. A. Cochran, in *Grandeur in Tennessee* (J. J. Augustin), covering the Classical revival; and C. F. Schmidt, in *Greek Revival Architecture in the Rochester Area* (published by the author). Other phases of American art are considered in Frances Lichten's *The Folk Arts of Rural Pennsylvania* (Scribner); Henry Kauffman's *Pennsylvania Dutch* (American Studio Books); and W. E. Howe's second volume of the *History of the Metropolitan Museum of Art* (Columbia), recording the years of expansion from 1904 to 1941.

Miscellaneous social themes are treated in R. S. Jones' *History of the American Legion* (Bobbs-Merrill); Albert Deutsch's *The Mentally Ill in America* (Columbia), an analysis of their care since colonial days; and two popular accounts of famous baseball teams, *The Chicago Cubs* (Putnam) by Warren Brown and *The Detroit Tigers* (Putnam) by W. G. Lieb.

DIPLOMATIC HISTORY

Despite popular preoccupation with world affairs, no major contribution was made during the year to the history of American diplomacy. General in scope but exceedingly brief is Edwin Borchard's, *American Foreign Policy* (National Foundation Press). The Far East continues to claim attention. K. S. Latourette, in *The United States Moves across the Pacific* (Harper), discusses our position in East Asia; F. R. Dulles, in *China and America* (Princeton), retells in an engaging manner American relations with that nation since 1784. More specialized studies include Arthur Walworth's *Black Ships off Japan* (Knopf), the story of the Perry expedition; Daniel Henderson's, *Yankee Ships in China Seas* (Hastings House); and E. H. Zabriskie's, *American-Russian Rivalry in the Far East, 1895-1914* (Pennsylvania). Diplomatic action affecting Jews during the last century is the theme of *With Firmness in the Right* (American Jewish Committee) by Cyrus Adler and A. A. Margalith. A. C. Millspaugh recounts his missions to Iran in *Americans in Persia* (Brookings). Recent developments are treated in C. A. Beard's *American Foreign Policy in the Making, 1932-1940* (Yale), a minute and sometimes misleading examination of Roosevelt's public utterances, done in the manner of a prosecuting attorney, and in Vera M. Dean's *The Four Cornerstones of Peace* (Whittlesey), a résumé of the conferences at Dumbarton Oaks, Yalta, Mexico City, and San Francisco.

CONSTITUTIONAL HISTORY

C. B. Swisher's *The Growth of Constitutional Power in the United States* (Chicago) is a readable summary by a recognized authority of the developing conceptions of the Constitution through the decisions of the U. S. Supreme Court. C. O. Gregory's *Labor and the Law* (Norton) covers the legal status of the workingman from the days when belonging to a union was a crime. More specialized are B. H. Nelson's *The Fourteenth Amendment and the Negro since 1920* (Catholic) and M. R. Konvitz's *The Alien and the Asiatic in American Law* (Cornell).

ECONOMIC HISTORY

Significant books on economic subjects were few in number in 1946. Continuing interest in business history was reflected in S. B. Clough's *A Century of American Life Insurance* (Columbia), dealing with the Mutual Life Insurance Co. of New York. The oil industry is treated in S. W. Tait, Jr.'s *The Wildcatters* (Princeton); Harry Botsford's, *The Valley of Oil* (Hastings House); and C. M. Wilson's, *Oil Across the World* (Longmans, Green), a saga of American pipelines. *America's Fabrics* (Macmillan) by Zelma Bendure and Gladys Pfeiffer is an exhaustive treatise. Different phases of transportation are considered in Edward Hungerford's *Men of Erie* (Random House); Devon Francis' *The Story of the Helicopter* (Coward-McCann); W. N. Leonard's *Railroad Consolidation under the Transportation Act of 1920* (Columbia); and B. R. Brazeal's *The Brotherhood of Sleeping Car Porters* (Harper). The human resources of the South are authoritatively discussed in *All These People* (North Carolina) by R. B. Vance and Nadia Dainlevsky. W. R. Van Dersal and E. H. Graham tell the story of soil conservation in *The Land Renewed* (Oxford); D. M. Ellis' *Landlords and Farmers in the Hudson-Mohawk Region, 1790-1850* (Cornell) is a scholarly presentation.

REGIONAL AND LOCAL HISTORY

Except for a few items, the American West was singularly neglected in 1946. Walter Havighurst's *Land of Promise* (Macmillan) is a popular treatment of the Northwest Territory. Indian affairs are the concern of Grant Foreman in *The Last Trek of the Indians* (Chicago) and M. L. Starkey in *The Cherokee Nation* (Knopf). W. R. Hogan's *The Texas Republic* (Oklahoma) is a social and economic history of the Lone Star government. Wayne Andrews' *Battle for Chicago* (Harcourt, Brace) recounts the contest for domination of the Windy City by the new aristocrats of industry and journalism. Other books of local interest are R. E. Barclay's

Ducktown (North Carolina) and Mrs. Lipscomb Norvell's *King's Highway* (published by the author).

The many series dealing with American lakes, rivers, mountains, and cities continue to produce volumes that are part history, part guide books, and part fiction, the exact proportion depending upon the competency of the author. The best of the year are F. F. Van de Water's *Lake Champlain and Lake George* (Bobbs-Merrill); Donald Davidson's *The Tennessee* (Rinehart), the first of two installments; C. P. Smith's *The Housatonic* (Rinehart); and Carey McWilliams' *Southern California Country* (Duell, Sloan and Pearce). Less successful are W. A. Roberts' *Lake Pontchartrain* (Bobbs-Merrill); Frank Waters' *The Colorado* (Rinehart); and I. McC. McMeekin's *Louisville: The Gateway City* (Julian Messner).

MILITARY AND NAVAL HISTORY

Aside from war histories, considered elsewhere, only two books are worthy of notice. Alfred Vagts' *Landing Operations* (Military Service Publishing Co.) is an encyclopedic survey of strategy and tactics from ancient times. D. W. Mitchell's *History of the Modern American Navy* (Knopf) makes no original contribution but does combine in one volume the findings of other scholars.

THE OTHER AMERICAS

The exploits of Lewis and Clark, Balboa, and Alexander Mackenzie are skillfully retold in *The Westward Crossings* (Knopf) by Jeannette Mirsky. J. A. Crow's *The Epic of Latin America* (Doubleday) is a popular account, somewhat weak on the later period. Other books about our neighbors north and south are John McDiarmid's *Commercial Policy in the Canadian Economy* (Harvard); S. W. Eastman's *Canada at Geneva* (Bruce Humphries); Miron Burgin's *Economic Aspects of Argentine Federalism, 1820-1852* (Harvard); P. E. James' *Brazil* (Odyssey); and T. L. Smith's *Brazil: People and Institutions* (Louisiana).

EUROPEAN HISTORY

Deprived of customary source materials, American scholars could make but limited contributions in 1946 to the history of countries other than their own. Perhaps the outstanding work of the year on a non-American subject is A. A. Vasil'ev's *The Russian Attack on Constantinople in 860* (Medieval Academy of America).

Books on the Ancient and Medieval eras include Jack Finegan's *Light from the Ancient Past* (Princeton), the archeological background of the Hebrew-Christian religion; W. W. Hyde's *Paganism to Christianity in the Roman Empire* (Pennsylvania), and E. H. Kantorowicz's *Laudias Regiae* (California), a study in liturgical acclamations and Medieval ruler worship.

For the Modern period the following should be noted: Stephen Bonsal, *Suitors and Suppliants* (Prentice-Hall), the role of the small nations at the 1919 Peace Conference; R. P. Casey, *Religion in Russia* (Harper); T. G. Chase, *The Story of Lithuania* (Stratford House); K. A. Douglas, *The French Railroads and the State* (Columbia); Nathan Edelman, *Attitudes of Seventeenth Century France toward the Middle Ages* (King's Crown Press); Albert Guerard, *France: a Short History* (Norton); S. W. Halperin, *Germany Tried Democracy* (Crowell), a political history from 1918 to 1933; Martin Hill, *The Economic and Financial Organization of the League of Nations* (Carnegie Endowment for International Peace); A. E. Kahn, *Great Britain in the World Economy* (Columbia); J. B. Mason, *The Danzig Dilemma* (Stanford), a study in peacemaking by compromise; S. T. McCloy, *Government Assistance in Eighteenth Century France* (Duke); G. E. Mylonas, *The Balkan States* (Eden Publishing House); Fletcher Pratt, *Empire and the Sea* (Holt), a popular account of England's war against Napoleon; Michael Sayers and A. E. Kahn, *The Great Conspiracy* (Little, Brown), the secret conflict against Soviet Russia; F. L. Schuman, *Soviet Politics at Home and Abroad* (Knopf); N. R.

Smith, *Land for the Small Man* (King's Crown Press), a study of publicly supplied small holdings in England and Wales from 1860 to 1937.

HISTORY OF ASIA AND AFRICA

No single work is outstanding. Among those to be noted are J. C. Archer, *The Sikhs in Relation to Hindus, Moslems, Christians, and Ahmadiyyas* (Princeton); Leon Arpee, *A History of Armenian Christianity* (Armenian Missionary Association); Ruth Benedict, *The Chrysanthemum and the Sword* (Houghton, Mifflin), a summary of patterns of Japanese culture; Nelson Glueck, *The River Jordan* (Westminster Press); W. S. Haas, *Iran* (Columbia); G. E. von Grunebaum, *Medieval Islam* (Chicago).

BIOGRAPHY

By MALCOLM OAKMAN YOUNG
REFERENCE LIBRARIAN, PRINCETON UNIVERSITY

GENERAL

To the Fiftieth Anniversary Number of *The New York Times Book Review,* dated Oct. 6, 1946, the biographer Marquis James contributes "Opening New Horizons for the Biographer," an interesting and illuminating survey of American biographies written since 1896. As if to complement this, there appeared in the *Saturday Review of Literature,* May 18, an article by J. C. Long, "Biography Now and Tomorrow." Both articles are thought provoking. On the technique of biography writing, the student should read the foreword to Laura L. Hinkley's *Charlotte and Emily: The Brontës* (Hastings). The Pulitzer Prize was awarded to the life of John Muir, *Son of the Wilderness,* by Linnie Marsh Wolfe.

COLLECTIVE WORKS

Stewart H. Holbrook's *Lost Men of American History* (Macmillan) portrays obscure men who have played significant parts in the development of the country. Seventeen essays on as many individuals make up Hermann Hagedorn's *Americans* (Day) and include, among others, Mark Twain, John Dewey, Woodrow Wilson. A chapter on Wilson is also found in *Great Teachers* (Rutgers Univ. Press), edited by Houston Peterson. Still another essay on Wilson is in *The Lives of Eighteen from Princeton* (Princeton Univ. Press), edited by Willard Thorp. *Public Men: In and Out of Office* (Univ. of North Carolina Press), edited by J. T. Salter, has 27 sketches, including such figures as Wendell Willkie, Henry Wallace, President Truman, a composite of our varying types of public officials. *Master Works of Autobiography* (Doubleday), edited by Richard D. Malley, includes condensations of such classical autobiographies as those of St. Augustine, Cellini, Pepys, Rousseau, Henry Adams. David Ewen adds to his list of similar books with *Men and Women Who Make Music* (Readers Press), with 26 sketches. *Fathers of Classical Music* (Beechhurst), by Charles Angoff, deals with lives of predecessors and contemporaries of Bach. *Russian Writers* (International Book Service) is a brief but useful biographical dictionary by Valentine Snow. A useful reference book is *Who's Who in Labor* (Dryden).

THE PRESIDENTS

Thomas Jefferson, American Tourist (Univ. of Oklahoma Press), by Edward Dumbauld, is an interesting account of many journeys in an active life, and of contemporary conditions. Two biographies of James Monroe appeared: *James Monroe,* a scholarly work by W. P. Cresson (Univ. of North Carolina Press), and *The Last of the Cocked Hats* (Univ.

of Oklahoma Press) by Arthur Styron. Likewise, two lives of Zachary Taylor were written: *Zachary Taylor,* by Brainerd Dyer (Louisiana State Univ. Press) and *Old Rough and Ready* (Vanguard), by Silas B. McKinley and Silas Bent.

The collection of works on Lincoln is numerous, as usual. A valuable critical, selective bibliography of Lincolniana is Paul M. Angle's *A Shelf of Lincoln Books* (Rutgers Univ. Press). *Lincoln and the South* (Louisiana State Univ. Press) is by J. G. Randall. *Legends that Libel Lincoln* (Rinehart) is by Montgomery S. Lewis. Another valuable work is Burton J. Hendrick's *Lincoln's War Cabinet* (Little, Brown). Other sidelights are found in F. Lauriston Bullard's *Abraham Lincoln and the Widow Bixby* (Rutgers Univ. Press), and the book by Oliver Carruthers and R. G. McMurty, *Lincoln's Other Mary* (Ziff-Davis), pertaining to Mary Owens. A revealing picture of Lincoln is in the *Diary of a Public Man* (Rutgers Univ. Press), by an unknown author and reprinted, with a foreword by Carl Sandburg, from the text of the 1879 appearance. To be included here, also, is Roy Meredith's *Mr. Lincoln's Camera Man* (Scribner) which deals with Matthew B. Brady.

Theodore Roosevelt and the Progressive Movement (Univ. of Wisconsin Press) is by George Mowry. A factual work is *The True Woodrow Wilson* (Revell) by Harold G. Black. *Woodrow Wilson, Some Princeton Memories* (Princeton Univ. Press), edited by William Starr Myers, includes impressions by several of his academic colleagues. *White House Physician* (Putnam), by Vice-Admiral Ross T. McIntire, reveals sidelights on Franklin D. Roosevelt. *As He Saw It* (Duell), by Elliott Roosevelt, dealing largely with the war years, stirred controversy. One of the books receiving excellent reviews was *The Roosevelt I Knew* (Viking) by Frances Perkins. Readable and illuminating is *Starling of the White House* (Simon and Schuster), memoirs of Col. Edmund Starling of the White House Secret Service Detail during the terms of our last five presidents, as told to Thomas Sugrue.

MEN IN PUBLIC LIFE

In *The Randolphs* (Bobbs, Merrill), H. J. Eckenrode chronicles a family prominent in Virginia and national affairs during early, critical days. *Alexander Hamilton* (Appleton), interpreted by Nathan Schachner, was well received. Another biography of the Vice-President of the Confederacy, *Alexander H. Stephens,* is by Rudolph Von Abele (Knopf). A Pennsylvania politician and educator is portrayed by Robert L. Mohr in his *Thomas Henry Burrowes, 1805-1871* (Univ. of Pennsylvania Press). *The American* (Duell), by Howard Fast, tells in the form of a novel the active story of the former Illinois governor, John Peter Altgeld. *A Georgia Lawyer* (Univ. of Georgia Press) is the autobiography of Stirling Price Gilbert, of the state Supreme Court. *The Wilson Era 1917-1923* (Univ. of North Carolina Press) is the fourth volume in the memoirs of Josephus Daniels. *Journey Through the Years* (Simon and Schuster) is the reminiscences of James M. Cox, once presidential nominee. One of the best received and outstanding books is the scholarly *Brandeis* (Viking) by Alpheus T. Mason. *Bernard M. Baruch* (Page) is a portrait by Harry I. Shumway.

THE MILITARY

General George Crook, His Autobiography (Univ. of Oklahoma Press), edited by Martin F. Schmitt, includes letters and memoirs of a frontier figure. His active life before the Civil War is presented in *Robert E. Lee in Texas* (Univ. of Oklahoma Press) by Carl C. Rister. Two books receiving considerable notice were *Touched with Fire* (Harvard Univ. Press), being the Civil War diary and letters of Oliver Wendell Holmes, Jr.; and *Memoirs of a Volunteer* (Norton) by John Beatty and concerned with the same period. *Born to Fight* (McKay) is Ralph B. Jordan's picture of Admiral William F. Halsey. *Patton, Fighting Man*

(Putnam) is by William B. Mellor, Jr., and *General George S. Patton, Jr.* (Dodd Mead) is by James Welland. General Marshall's wife presents their life together in *Together* (Tupper and Love). Seen from two angles is Gen. Dwight D. Eisenhower: *My Three Years with Eisenhower* (Simon and Schuster), the diary of Capt. Harry C. Butcher; and *Sergeant Mickey and General Ike* (Putnam), the tale of Michael J. McKeogh, orderly.

AUTHORS AND THE PRESS

Isabelle W. Entrikin wrote, as her dissertation, *Sarah Josepha Hale and Godey's Lady's Book* (Univ. of Pennsylvania Press). The Hossier novelist of the late 19th century, Edward Eggleston, is the subject of a book by William P. Randel (King's Crown Press). Perhaps the first all-round biography of Lafcadio Hearn is by Vera McWilliams (Houghton Mifflin). *Hubert Howe Bancroft* (Univ. of California Press) is the story of the historian of the West, by John W. Caughey. Containing much hitherto unpublished material is *Mark Twain, Business Man* (Little, Brown) by his great-nephew Samuel C. Webster. A brief biography is *Edwin Arlington Robinson* (New Directions), a critical study by Yvor Winters. Beautifully written and bringing clearly to the reader the late poet's memories and recalling her ancestors, is the posthumous *The Lost Horizon* (Holt) by Winifred Welles.

Opinions and recollections are found in *And Hearing Not* (Scribner) by the writer and advertising expert E. E. Calkins. Another agreeable book to be read is *The Happy Profession* (Little, Brown) by Ellery Sedgwick, former editor of the *Atlantic Monthly*. Kent Cooper tells in fiction *Anna Zenger: Mother of Freedom* (Farrar) the story of the wife of John Peter Zenger of the early 18th century, whose names are connected with the freedom of the press. The printer, editor, crusader, Horace Greeley, is recalled once more, by Harry L. Stoddard (Putnam). *An Honorable Titan* (Harper) is Gerald W. Johnson's picture of Adolph Ochs of *The New York Times*. Two newspaper men recall their youth: Gene Fowler in *A Solo in Tom-Toms* (Viking), and Charles Driscoll in *Country Jake* (Macmillan). *How to Grow Old Disgracefully* (Duell) is an outspoken self-portrait of the artist, writer, editor, Norman Anthony. What is called a "biography in pictures" is Lee G. Miller's *An Ernie Pyle Album* (Sloane). *Washington Tapestry* (Whittlesey) is the readable story of Olive Ewing Clapper, widow of the correspondent Raymond Clapper. To conclude this section, should be listed one of the most valuable books of the year, *The Autobiography of William Allen White* (Macmillan), which appeared not long after the death of the Emporia newspaper man.

TEACHERS, PREACHERS, AND OTHERS

William Torry Harris, nationally a leader in education, is well drawn in *Yankee Teacher* (Philosophical Library) by Kurt F. Leidecker. The first president of Johns Hopkins University, Daniel Coit Gilman, has as his biographer another educational leader, Abraham Flexner (Harcourt). Rush Rhees, long president of the University of Rochester, is the subject of a work by John R. Slater (Harper). *James Harvey Robinson, Teacher of History* (King's Crown Press) is by Luther V. Hendricks. *River of Years* (Lippincott) is the recollections of the eminent preacher, Joseph Fort Newton. Another life of the great surgeon is *Harvey C. Cushing* (Springfield, Ill., Thomas) by John F. Fulton. Largely concerned with his own career in China is Dr. Edward H. Hume's *Doctors East, Doctors West* (Yale). *Five Million Patients* (Scribner) is by the public health authority, Dr. Allen W. Freeman.

David Rittenhouse (Univ. of Pennsylvania Press) recalls the 18th century scientist, and is by J. Edward Ford. A Hoosier inventor is sketched in Fred Kelly's *David Ross: Modern Pioneer* (Knopf). Two contemporary minor thinkers of the 19th century receive attention in the publication of their journals, with some biographical data: Charles King Newcomb's *Journals* (Brown Univ. Press), edited by Judith K. Johnson; Ezekiel G. C. Wood's *Wandering in the Wilderness* (Dietz Press), journals edited by William E. Wood. Covering practically all American history and most of the professions here mentioned is *The Lowells and Their Seven Worlds* (Houghton Mifflin) by Ferris Greenslet, one of the lasting productions of the year.

VARIOUS ARTISTS

John Lloyd Wright's *My Father Who Is on Earth* (Putnam) is his picture of the unconventional architect, Frank Lloyd Wright. A frank self-revelation is by the painter Ione Robinson, *A Wall to Paint On* (Dutton). *Singin' Yankees* (Univ. of Minnesota) by Philip D. Jordan, presents the New Hampshire family who, from the 1840's until nearly the end of the century, traveled on concert tours. A pioneer in teaching music in schools, Lowell Mason, is portrayed by Arthur L. Rich (Univ. of North Carolina Press). Bruno Walter's *Theme and Variations* (Knopf) is the autobiography of the orchestra conductor. Readable with its anecdotes and personal pictures is *From the Top of the Stairs* (Little, Brown) by Gretchen Finletter, daughter of Walter Damrosch. *Paul Robeson* (Messner) is by Shirley Graham, written for juveniles.

The artist, James Montgomery Flagg, in *Roses and Buckshot* (Putnam), presents a candid picture of himself and of many others. The German artist and refugee, George Grosz, has written an autobiographical work in *A Little Yes and a Big No* (Dial). James J. Sweeney has written of another refugee artist in his *Marc J. Chagall* (Museum of Modern Art). This same artist's wife, Bella Chagall, has written her recollections *Burning Lights* (Schocken Books). *Duke Ellington* (Creative Age) is by Barry Ulanov. *Really the Blues* (Random) is the frank story of the jazz musician Mezz Mezzrow, by himself and Bernard Wolfe. *Stardust Road* (Rinehart) is the self-story of the popular composer Hoagland (Hoagy) Carmichael. *From Gags to Riches* (Fell) is the anecdotal story of Joey Adams, comedian, written by himself. With stories of many celebrities, *Impresario* (Random) is an amusing compilation by the manager, S. Hurok.

INDUSTRIALISTS AND OTHERS

A 19th century Pennsylvania industrialist leads this group: Eleanor Morton has written *Josiah White: Prince of Pioneers* (Day). *Henry Merggs: Yankee Pizarro* (Duke Univ. Press) by Watt Stewart, tells of the man who went to Reno in the 70's and developed railroads and other enterprises. A saga of the Tabors of the Colorado gold mines is *Here They Dug the Gold* (Reynal), by George F. Willison. *Fabulous Empire* (Houghton Mifflin) is Fred Gipson's narrative of George Washington Miller, his sons, and their huge ranch developments in Oklahoma. A pioneer in industrial research is recalled in John T. Broderick's *Willis Rodney Whitney* (Albany, Ft. Orange Press). A colorful railroader is the subject of Frank Cunningham's life of Big Dan Cunningham (Deseret News Press). Hubert Herring's *The Education of George W. Marston* (Pomona College) is the story of a west coast merchant, while Richard E. Day's *Breakfast Table Autocrat* (Moody Press) is the life story of the Chicago manufacturer, Henry Parsons Crowell. A too short, delightful volume is *My Boyhood in a Parsonage* (Harper) by the partner of the Morgans, Thomas W. Lamont.

INFORMAL NARRATIVES

Sometimes verging on fiction, this type of book portrays real characters, typical of American life. *Papa Went to Congress* (Doubleday), by Kenneth Horan, is largely set in the late 19th century. *We Shook the Family Tree* (Random) is a picture of small town life in the 1920's, by Hildegarde Dolson. *Three Parts Scotch* (Bobbs, Merrill) by Guthrie Burton, gives the recollections of a professor's wife. *Skinny Angel* (Whittlesey) is another picture of a professor's family set in the Midwest by Thelma Jones. *Abbie* (Putnam) is a vivid picture of his English aunt, by Dane Chandos. *Grandfather Objects* (Doubleday) presents another amusing figure, by Walter Beebe Wilder. A pleasant portrait of her grandmother is *Right as Rain* (Random) by Bernice Richmond. The list concludes with R. E. Gould's memorable *Yankee Storekeeper* (Whittlesey).

MISCELLANEOUS

To Master—A Long Goodnight (Creative Age) is the title chosen by Brion Gysin for his portrait of the former slave and probable original of "Uncle Tom," Josiah Henson. *Jim Bridger, Mountain Man* (Morrow) is the lively story of a pioneer figure and explorer, by Stanley Vestal. *Last of the Bad Men* (Bobbs, Merrill) is Jay Monaghan's record of Tom Horn.

Women are the subject of several books: *Mary Richardson Walker* (Caxton) in which Ruth K. McKee portrays an early pioneer across the Rockies; Mary Hobson Draper recalls her mother's pioneer experiences in *Though Long the Trail* (Rinehart); *No Time for Tears* (Houghton Mifflin) is the autobiography of Lora Wood Hughes, nurse from early Kansas days to the present.

The center of a long, famous New Orleans lawsuit is Nolan B. Harmon's subject in *The Famous Case of Myra Clark Gaines* (Louisiana State Univ. Press). *American Daughter* (Univ. of Chicago Press) is recollections of the Negro, Era Bell Thompson. An Iowa childhood is recalled in Martin Yoseloff's *No Greener Meadows* (Ackerman). *Broadside to the Sun* (Norton) by Don West, and *For Here Is My Fortune* (Whittlesey) by Amos R. Harlin, are pictures of Ozark farm life and small town life in the Missouri hills respectively.

Eddie Rickenbacker (Macmillan) is Hans Christian Adamson's story of the famous aviator. A thought-provoking book is *Boy from Nebraska* (Harper), Ralph G. Martin's narrative of Ben Kuroki, of Japanese parentage. James R. Fair's *Give Him to the Angels* (Smith and Durrell), is the very frank portrait of the prize fighter, Harry Grebs. Lawyer, architect, politician, book-collector Messmore Kendall labels his reminiscences *Never Let Weather Interfere* (Farrar, Straus). Lilly Daché, milliner, tells of her career in *Talking Through My Hats* (Coward). This varied group ends with two inspiring books: the first by a cripple, Louise Baker, *Out on a Limb* (Whittlesey), and the other by blind Hector Chevigny, *My Eyes Have a Cold Nose* (Yale Univ. Press).

FOREIGN SUBJECTS

Harold Lamb, already known as a chronicler of ancient history, has now produced *Alexander of Macedon* (Doubleday). A study of the man and his work is R. Langston Douglas' *Piero di Cosimo* (Univ. of Chicago Press), as is Arthur S. Rigg's *Titan the Magnificent* (Bobbs, Merrill). *Spinoza* is an analysis by Rudolf Kayser (Philosophical Library). Herbert Weinstock's *Handel* (Knopf) and Karl Geiringer's *Haydn* (Norton) present musicians we associate together. Although a translation from the German, *Secretary of Europe* (Yale Univ. Press) is by a former United States soldier, Golo Mann, and deals with Friedrich von Gentz, "enemy of Napoleon."

The musician, philosopher, doctor, Albert S. Schweitzer, receives honor in a work by George Seaver (Harper). *Pushkin, Poet and Lover* (Doubleday) is by Lydia Lambert. One of the best interpretations of the man and writer is *Leo Tolstoy* (Little, Brown) by Ernest J. Simmons. *Priestess of the Occult* (Knopf) is Gertrude M. Williams' sympathetic story of Madame Blavetsky, founder of the Theosophical Society.

Hugo Leichentritt studies the conductor Serge Koussevitzky, along with the Boston Symphony Orchestra, in a book published by the Harvard University Press. Clarence A. Manning's *Soldier of Liberty* (Philosophical Library) recalls Casimir Pulaski. *In Search of Two Characters* (Scribner), by Dormer Creston, deals with Napoleon I and his son, while the former's sister Pauline receives attention in *Pauline Bonaparte* (Rinehart) by Harrison Brent. *A Prince in Their Midst* (Univ. of Oklahoma Press) is A. J. Hanna's narrative of the adventurous life of Achille Murat on the American frontier.

A valuable study is *Stendhal* (Doubleday), by Matthew Josephson. A well reviewed book was *Geoffrey Chaucer of England* (Dutton) by Marchette Chute. There have been two books on Christopher Marlowe: Charles M. Rinehart's *The Muse's Darling* (Rinehart) and the rather more scholarly *Christopher Marlowe, A Study of His Thought, Learning and Character* (Univ. of North Carolina Press), by Paul H. Kocher. A minor writer of the 17th century is found in Howard W. Troyer's *Ned Ward of Grubstreet* (Harvard Univ. Press). Two scholarly works appeared concerned with a little known dramatist of the 18th century, Arthur Murphy, one by H. H. Dunbar (Modern Language Association) and the other by John P. Emery (Univ. of Pennsylvania Press).

Two doctors of 18th century London are portrayed in *New Aspects of John and William Hunter* (Schuman) by Jane M. Oppenheimer. Together with a panorama of London life are the activities of a journalist, biographer, editor in *Isaac Reed's Diaries 1762-1804* (Univ. of California Press), edited by Claude E. Jones. A fascinating figure and the period 1745-1826 are brought to life in *Lady Sarah Lenox* (Putnam) by Edith R. Curtis. A fabulous character is found in *Raffles of Singapore* (Doubleday) by Emily Hahn. *Charlotte and Emily: The Brontës* (Hastings) by Laura L. Hinkley is a successful production. The minor 19th century poet Owen Meredith (Lord Lytton) receives critical analysis by Aurelia B. Harlan (Columbia Univ. Press).

The months spent by Robert Louis Stevenson in Monterey, Calif., are chronicled in *No More a Stranger* (Stanford Univ. Press), by Anne B. Fisher. Hilton Brown's *Rudyard Kipling* (Harper) is regarded as one of the more successful surveys of the subject. *The Man from Limehouse: Clement Richard Attlee* (International Mark Twain Society), by Cyril Clemens, is a factual compilation. *G. B. S. 90* (Dodd, Mead), edited by S. Winsten, is a collection of numerous essays on every side of Shaw, his philosophy and his work.

In concluding, one should call attention to the difficulty in distinguishing who are definitely American authors and American subjects, a condition increasing largely because of refugees whose stay here has become more or less permanent.

TRAVEL

By McFall Kerbey

Chief, Research Division, National Geographic Society

GENERAL

Publication of travel books took a step forward in 1946 after the meager output of the war years. Most of them were built on observations of several years past. There were still deterrents such as continuing disruption of travel facilities and, on the production side, shortage of paper.

The book of widest scope was *Great Adventures and Explorations* (Dial Press) edited by Vilhjalmur Stefansson, one of the most comprehensive summaries that has been published in a single volume of the long story of "how man came to know his world." Told in large part in the words of the chief discoverers themselves, it covers world-wide explorations from the time of Pytheas (330 B.C.) to the present. Spanning two continents, *Pacific Crest Trails* (Superior Pub.

Co.) by Joseph T. Hazard deals with the trails and highways and recreational areas in the Pacific coast highlands from central Alaska to Cape Horn.

CANADA

Aspects of many-sided Canada, the mountains of British Columbia, the mining towns of Ontario and the Dominion's chief city, are presented in four books. *Driftwood Valley* (Little, Brown) by Theodora C. Stanwell-Fletcher is the story, written with sensitiveness and insight, of the stay of two naturalists, husband and wife, in an almost untouched wilderness area in north central British Columbia, while they studied and recorded the ways of birds and beasts as season followed season. The volume is enriched with excellent charcoal sketches by John F. Stanwell-Fletcher and includes also complete lists of the plants and animals of the region. Nearer the U. S.-Canada border J. Monroe Thorington in *The Purcell Range of British Columbia* (American Alpine Club) sketches the topography and history of this mountain group which gives birth to the Columbia River, and relates his own mountaineering experiences. The timber, fertile soil, hydroelectric power, and mineral wealth of Northern Ontario—"an almost unknown country within a day's journey of our richest city"—is described by O. T. G. Williamson in *The Northland* (Ryerson Press). The combined charm of Montreal's setting on the slopes of its island mount, and its atmosphere, half-French half-British, is brought out in *The Lure of Montreal* by W. P. Percival.

EASTERN UNITED STATES

The diversity of scenery, industry, architecture, and ways of life throughout the United States are shown in *Look at America* (Houghton Mifflin) by the editors of *Look Magazine*, a collection of striking photographs, a few in color. *Cruising to Florida* (McGraw-Hill) by Morley Cooper recounts the adventures and misadventures of the author and his wife during a leisurely three-months' journey in a cabin cruiser along the canals, rivers, sounds, and lakes that make up the Intracoastal Waterway from the Delaware River to southern Florida.

An addition in the East to the American Lakes Series is *Lake Champlain and Lake George* (Bobbs-Merrill). Frederic F. Van De Water traces the history of the two bodies of water from glacial times, through their turbulent frontier days, to the serene present when they are "museum-piece lakes" sought by vacationists. *The Housatonic, Puritan River* (Rinehart) by Chard Powers Smith is one of the Rivers of America Series. It is the story of a 115-mile valley through Massachusetts and Connecticut whose people, for 300 years, have struggled successfully against cupidity, inflowing wealth, worldliness, and over-industrialization. In *A Pilgrim Returns to Cape Cod* (Yankee Pub. Co.), Edward Rowe Snow tells of a seven-weeks' hiking tour around the Cape in the spring of 1946, spicing his narrative with anecdotes and bits of history. Katharine Crosby, in *Blue-Water Men and Other Cape Codders* (Macmillan), reports on Cape Cod's "people, present and past, and their houses and their ships and their way of life."

THE SOUTH

The Tennessee River of pre-Civil War days, in whose valley Indians, white traders, and settlers from the Atlantic States made early American history, is the theme of Donald Davidson's *The Tennessee* (Rinehart). This is another of the Rivers of America Series, the first of two volumes. *Lower Piedmont Country* (Duell, Sloan & Pearce), a volume in the American Folkways Series, by H. C. Nixon, is the story of the people of the hill country of Tennessee, Alabama, and Georgia and of their problems and patterns of life. *Charleston* (Corinthian Pubs.) is a collection of 74 full-page photographic studies by F. S. Lincoln showing the charm of the city's many structures of early American design. In *Wild Acres* (Dutton), the naturalist-author, Henry Hazlitt Kopman, introduces the reader to the strange, alluring flat country of the Louisiana-Mississippi Gulf Coast, a land of swamps, savannas, and "mudlump" islands, largely uninhabited save for varied and abundant bird life. The informal descriptions range over many species of migratory and resident birds that frequent the region through the seasons. New Orleans' backdoor waterway and yachting area, Lake Pontchartrain, is the subject of a book of that name (Bobbs-Merrill) by W. Adolphe Roberts. Another of the American Lake Series, the volume traces the history of the lake—really a lagoon—from the settlement of New Orleans in 1718 to the days of Huey Long.

MIDDLE WEST AND WEST

Midwest at Noon (U. of Chicago Press) by Graham Hutton is a study of the area, climate, people, customs, economics, and politics of "a leading industrial and agricultural region of the globe." In *San Antonio: City in the Sun* (McGraw-Hill) Green Peyton Wertenbaker paints an intriguing picture of what he calls "The crossroads of North America," a single community in which he finds all the diverse elements of Texas as well as influences from the South, the West, and Mexico. *Trail Dust and Saddle Leather* (Scribner) by Jo Mora is a fascinating history of the American cow country and its cattle industry, a biography of the cowboy, and a description of his tools from saddle, and bridle and lariat to branding iron and chuck wagon. Frank Waters' *The Colorado* (Rinehart), one of the Rivers of America Series, deals with the mighty river itself, its vast basin of mountains and deserts, its course through some of the world's greatest canyons, its people, and its future. *Listen, Bright Angel* (Duell, Sloan & Pearce) by Edwin Corle, is a story of the Grand Canyon told through its influence on people who have been associated with it during the four centuries since its discovery. The biography of the Gila River of southern Arizona is recorded in *River of the Sun* (U. of New Mex. Press) by Ross Calvin. From its source in 10,000-foot mountains in New Mexico, through ranching country and desert to its confluence with the Colorado, the river flows through the sunniest region in the United States; hence the book's title. It traverses as well, the author shows, a land of high adventure beginning with Coronado in 1540.

George Palmer Putnam in *Death Valley and Its Country* (Duell, Sloan & Pearce) writes of a unique winter resort region, "the lowest, driest, and hottest spot in America." He notes its geology and geography, traces the history of the ghost towns that encircle it, and brings to life the odd assortment of characters that has trod its salt flats since the Forty-niners gave its ill-omened name to the world. *My San Francisco* (Bobbs-Merrill), by Gertrude Atherton, is a chronicle of the legends of San Francisco's beginnings along with Mrs. Atherton's own warm memories of the town's middle age, and her keen observations on the great port-city of the present. Carey McWilliams' *Southern California Country* is an unconventional but informative study of the social, economic, and geographic factors that have made the southern Californians what they are today. *The Pacific Coast Ranges* (Vanguard Press), edited by Roderick Peattie, is a new volume in the American Mountain Series, with a collection of essays by ten specialists. The book presents a comprehensive story of the uplands that stretch from Puget Sound to the Mexican border, and the people who dwell there.

BERMUDA AND LATIN AMERICA

Bermuda Journey (Coward-McCann) by William Zuill is a leisurely guidebook to the islands, lightened by frequent excursions into history. Various aspects of Cuba, Havana and "the interior" (which includes the rest of the island), life among sophisticated islanders and among humble field workers, and the importance of cooperative societies, are described by Erna Fergusson in *Cuba* (Knopf).

Ivan Bullot's *Air Travel Guide to Latin America* (Franklin Watts) is one of the recent handbooks tailored to fit the needs of the traveler by air to the countries south of the Mexican border. *Mexico South* (Knopf) by the Mexican artist Miguel Covarrubias, is the story of the little known Isthmus of Tehuantepec and its people, present and past, with special reference to the rich art, ethnology, and folklore of the region and to the important archeological finds of recent years at Monte Alban, La Venta, Tres Zapotes, and other sites. It is appropriately illustrated with sketches and paintings by the author in addition to photographs. How the charms of Mexico in desert and jungle, among city people and village folk, cast their spell over her in four years of wandering is told by Neill James in *Dust on My Heart* (Scribner). *Mexican Heritage* (Augustin) is a group of photographs by Hoyningen-Huene which presents the "fact of Mexico in all her moods." *The Land and People of Brazil* (Lippincott) by Rose Brown combines general statistics of Brazil with detailed descriptions of the country's best developed and most heavily populated region—the coastal states and their leading cities. The book is one of the Portraits of the Nations Series.

BRITISH ISLES AND THE FAROES

Of books devoted to interpreting England alike to Englishmen and others of the English-speaking world, two seem worthy of special mention. One is *The Land of the English People* (Lippincott) by Alicia Street, another of the series, Portraits of the Nations. In it the author portrays with sympathy the way of life of the English in a setting which she shows to be pleasant and charming despite the island's heavy population. The second is *The Englishman's Country* (Collins) edited by W. J. Turner consisting of a series of essays on England's villages, country houses, cities and small towns, ports and harbors, gardens and inns. One of the few books of the year about Ireland is *In the Kingdom of Kerry* (Dundalgan Press) by Richard Hayward, a personal record of the author's somewhat desultory wanderings through the present County of Kerry. Another is *Stranger in Aran* (Cuala Press) by Elizabeth Rivers which records a spring and mid-winter visit of the author to the bleak islands off the west coast of Ireland. The stark, sea-lashed Faroe Islands, north of Scotland, and the activities of their rugged people are described in brief text and vivid photographs in *The Faroes in Pictures* (Allen and Unwin) by Gordon Huson.

EUROPE AND THE SOVIET UNION

Lost Treasures of Europe (Pantheon Books), edited by Henry La Farge, consists of 475 camera studies of famous buildings, monuments, portions of cities, and works of art that were destroyed by the bombs and shells and flames of war. *A Guide to the Soviet Union* (Dial Press) by William M. Mandel is a comprehensive study of the development of the U. S. S. R., its governmental and economic organization, and the cultural forces at work. An overall picture of the many diverse groups of the country is given in *The Peoples of the Soviet Union* (Harcourt, Brace) by Corliss Lamont, which also shows the striking contrast in their treatment under the Tsarist and Soviet regimes. *Russia on the Way* (Macmillan) by Harrison Salisbury is a narrative of the author's observations during an eight-month's tour of duty as a correspondent in Moscow and on a journey with Eric Johnston into Siberia and the Southeast. *Soviet Asia Mission* (Reynald & Hitchcock) by Henry A. Wallace is an account of the author's seven-weeks' trip by air to Soviet Asia and China, in the spring of 1944. The greater part of the book is devoted to Siberia and its developing industry and agriculture.

AFRICA

From the lips of ordinary folk—a guide, merchants, housewives, artisans, date-growers, a bedouin, a barber, dock-workers—Guido Rosa presents in *North Africa Speaks* (Day) a cross section of the drama of everyday life in the difficult environment of Algeria and Morocco. In *Grown-up Liberia,* Francis Mitchell tells a fragmentary story of his travels in Liberia and his disappointment at the working of an African government patterned after that of the United States. *In the Forests of the Night* (Barries) by James Riddell is the story of the adventures of two Englishmen armed only with cameras, who obtained remarkable photographs of wild animals in the Belgian Congo.

NEAR EAST AND INDIA

Syria (Hale, Ltd.) by Robbin Fedden reveals that key land of the Levant through glimpses of its outstanding geographic features—the fertile Phoenician coast, the rich oasis capital of Damascus, steppes, desert, the Euphrates—all with a background of the country's long history and its noteworthy archeological remains. A different approach to Syria is furnished by Agatha Christie Mallowan. Accompanying her archeologist husband on a scientific expedition, she writes entertainingly of her experiences in *Come Tell Me How You Live* (Dodd, Mead). *Baalbek, Palmyra* (Augustin) consists of two collections of excellent photographs by Hoyningen-Huene of the ruins of magnificent temples and gigantic building stones of Baalbek, and of the remains of the tombs and temples of the caravan center, Palmyra. A history of the two cities by David M. Robinson completes the book. "The earth's most storied river" is traced by Nelson Glueck in *The River Jordan* (Westminster Press) as it winds through its great trench largely below sea level, past ruined settlements of ancient, Biblical, and Roman times, to the Dead Sea. Much farther east Elva Babcock Gardner, an American mission school teacher, contributes *Lure of India* (Pacific Press), a series of word sketches of the Indian scene with its beauty and ugliness, its extremes of wealth and squalor.

FAR EAST

Three books on China and one on Japan seek to explain those little understood Oriental lands to readers in the West. *China: Her Life and Her People* (U. of London Press), by Mildred Cable and Francesca French, presents both sweeping and detailed views of the sprawling land, its villages and towns, its customs, industries, and arts. Vaughan White in *Our Neighbors, the Chinese* (Rinehart) undertakes to clear up the Westerner's confused picture of China and to capture the reality of the common people in the background. *China Cycle* (Macmillan, Ltd.) by Richard P. Dobson tells vividly of the author's adventures and observations while traveling through the southern provinces. With a knowledge gained from many years of familiarity with the Japan of city and country, Willard Price, in *Key to Japan* (Day) analyzes for Americans the unpredictable psychology of the Japanese people, their double-meaning language, and some of their moral sore spots, as well as their keen intelligence and sensitiveness.

PACIFIC AREA

The strange fascinating temple music of Bali weaves in and out of the story of the village life of the islanders told by Colin McPhee, a young American composer in *A House in Bali* (Day). In *Let's Go to Australia* (Conjure House) George F. Taubeneck provides a needed book on the earth's loneliest continent. It is lonely only geographically, the reader finds from the author's comprehensive survey of its virile individualistic people, their experiments in government, their great cities, their cattle and sheep stations, and their promising future. Although primarily a study of New Zealand's socialized institutions and their development, *New Zealand: Pacific Pioneer* (Macmillan) by Philip L. Soljak includes chapters relating to the geography of "this youngest of nations" and the current activities of its people. A more comprehensive treatment, yet in informal style, is provided by *Introduction to New Zealand,* a government publication prepared by the Department of Internal Affairs of the

Dominion. After describing the geography of the country, the book deals with its history, government, economics and statistics, its plant and animal life, and the cultural atmosphere of its people. In *Where the People Sing: Green Land of the Maoris* (Knopf), John Lee Zimmerman, a U. S. Marine Captain, tells with understanding of the able natives who have adopted many modern ways yet preserve the best of their tribal heritage. That the changes in Tahiti, deplored by some writers, are superficial and that the charm of its people is as marked now as in the past is the theme convincingly developed by William S. Stone in *Tahiti Landfall* (Morrow).

BELLES LETTRES

By May Lamberton Becker

Reader's Guide, *New York Herald Tribune*

FOLKLORE AND OTHER THEMES

Robert P. Tristram Coffin's *People Behave Like Ballads* brought out the people and folklore of New England. The travels of Kenneth Porter, a native of Kansas, in Mexico and the British Isles, resulted in *No Rain From These Clouds;* this included folk-ballads of the Seminole Indians. Norman Rosten's *The Big Road,* a narrative poem, extended through the bridgemaking of all the ages to its climax, the Alcan Highway. Alfred Kreymborg's *Man and Shadow,* in the course of a day's wandering in New York's Central Park, dealt in types of human nature.

SOME BRITISH POETS

Among British poets published this year in the United States were V. Sackville-West, whose *The Garden,* a major work, grouped its lyrics around the year's four seasons; Francis Brett Young's *The Island,* a narrative pageant of English history; and *The Bridge,* by Ruth Pitter, poems from 1939 to 1944 of a poet whose career began with winning the Hawthornden Prize and whose following has been steadily strengthening in both countries.

WILLIAMS AND CUMMINGS

The work in progress of William Carlos Williams, a long philosophical study, made a distinguished entrance into print with *Paterson I,* a distinctively different treatment of the theme. E. E. Cummings, in his fantasy *Santa Claus: a Mortality,* caused the Saint and Death to exchange symbols.

CENTENNIAL EDITION OF SIDNEY LANIER

An event of importance in the history of American literature was the publication in ten volumes of the Centennial Edition of Sidney Lanier, an undertaking begun by Duke University but taken over by Johns Hopkins—appropriately, as it was at this university that he lectured and at Baltimore that some of his best poems were written. Another publication of historic importance was the *Last Poems* of Philip Morin Freneau, the first poet of our early republic, edited by Lewis Leary, his biographer.

HISTORY AND DEVELOPMENT OF POETRY

The *History of American Poetry: 1900-1940* by Horace Gregory and Marya Zaturenska, was an important publication of the year, tracing the trends, influences and forms of four decades and taking in significant developments. *The Nature of Poetry,* by Donald A. Stauffer, was a critical examination of its structure, texture, and meaning that extended from Spenser to Yeats. *The Poet in the Theatre,* by Ronald Peacock of Leeds University, surveyed the subject since 1870 with special reference to T. S. Eliot, Henry James, Hebbel, Grillparzer, Ibsen, Shaw, Chekhov, Synge, and Yeats. Mark Schorer, in *William Blake,* offered a new interpretation of the poet in relation to his time and to the troubled state of man's faith. *The Noble Voice,* by Mark Van Doren, appealing to a general audience with the resources both of poet and of critic, revealed the possibilities to the spirit of nine great poets from Homer to Wordsworth, each in a master work. Walter Jackson Bate treated *The Stylistic Development of Keats,* and Trusten W. Russell in *Voltaire, Dryden and Heroic Tragedy,* discussed how the dramatic theory of Voltaire was affected by his knowledge of English tragedy.

DRAMA IN PRINT

Of the year's published plays also appearing on the stage, the most considerable was *The Iceman Cometh,* Eugene O'Neill's first offering after a silence of 13 years. The New York Drama Critic's Circle in April 1946 awarded no prize for the season, but the Pulitzer went to a political comedy, *State of the Union,* by Russell Crouse and Howard Lindsay, whose plot softened its satire by liberal use of stage convention in showing the grooming for a Presidential nomination of an amateur in national politics. Soldiers after and during the late war appeared in several printed plays: *A Sound of Hunting,* by Harry and Peter M. Brown, American soldiers at Cassino; *Home of the Brave,* by Arthur Laurents, a drama of race-prejudice involving a shell-shocked soldier; *Soldier's Wife,* by Rose Franken, a comedy based on readjustment to family life; and *Deep Are the Roots,* by Arnauld D'Usseau and James Gow, disillusioning postwar experiences of a Negro veteran returning to the South and the white family where he had been raised. Irwin Shaw's *The Assassin* was also a war play (Algiers in 1942), but in printed form it attracted less interest than its preface, a long statement of the author's objections to the present state of the American theatre and of the futility of being a playwright in America. The author of *The Glass Menagerie,* Tennessee Williams, published a volume of 11 starkly realistic one-act plays, *27 Wagons Full of Cotton.* Elmer Rice, whose famous *Street Scene* took shape during the year as a "musical," published a fantastic comedy *Dream Girl,* S. N. Behrman a triangle play *Dunnigan's Daughter,* and Garson Kanin a farce comedy *Born Yesterday,* all of which were successful in production.

George Jean Nathan's *Theatre Book of the Year 1945-1946,* much more than a year-book, provided both record and evaluation of the season on Broadway: John Mason Brown, until recently a newspaper critic of the drama, now a literary editor, and always one who loves the stage with reservations, produced a running commentary on our theater and other matters in *Seeing Things.* Eric Bentley's *The Playwright as Thinker,* a study of the drama since Ibsen and Shaw, included them both with Strindberg, Wilde, Pirandello, Cocteau, Sartre, and Eugene O'Neill. *Drama and Theatre Illustrated by Seven Modern Plays,* edited by A. R. Fulton, was one of the most interesting of an uncommonly large number of play collections: these seven plays ranged from Pinero to Noel Coward.

ESSAYS

The informal essay, capable as it is of almost infinite variety, flourished this year in various forms. E. B. White's incisive comments on contemporary affairs, in *The Wild Flag,* included politics and statecraft. The "incomparable Max" Beerbohm added another volume to the canon for his following on both sides of the ocean, a chronological series of broadcasts and articles, *Mainly on the Air.* Thomas Hornsby Ferril sent out from Colorado *I Hate Thursday,* first published in *The Rocky Mountain Herald,* Denver's oldest weekly. *An American Year,* by Harold G. Borland, is a sequence of nature studies. *The Natural History of Nonsense,* by Bergen Evans, attacks with lively humor every sort of superstition and delusion concerned with matters basic, such as race psychology, sex, religion, and hygiene. The essays in *The Clock of History*, by Alvin Johnson, founder of the University in Exile and one of the foremost exponents of liberal democracy, arise from the trend of events during the last 14 years. *The World Today*, a collection of speeches and articles, extended through the rich career of Nicholas Murray Butler, president emeritus of Columbia University.

CRITICISM

The Basis of Criticism in the Arts, a study of aesthetics by Stephen Coburn Pepper, deals with mechanistic, contextualistic, organistic, and formistic methods of criticism. *Preface to an American Philosophy of Art*, by Amos Philip McMahon, is a review of the Western tradition of art philosophy. Harley Granville Barker's *Prefaces to Shakespeare* included five critical essays on stagecraft and playwriting. *The Craft of Comedy*, in the form of letters exchanged between the celebrated actress Athene Seyler and the critic Stephen Haggard, discussed ideas of technique. *Victorian Album*, by Luch Poate Stebbins, surveyed the place of literature of women writers of the period, including Charlotte Brontë, George Eliot, Mrs. Gaskell, and Margaret Oliphant. Two brilliant and popular British reviewers offered collections of opinion: Cyril Connolly's *The Condemned Playground* and George Orwell's *Dickens, Dali and Others*.

ENGLISH LANGUAGE AND LITERATURE

By Donald Nelson Koster
Assistant Professor, Adelphi College

GENERAL

In the first full post-war year American publishers continued to be faced with most of the problems that had confronted them throughout the period of hostilities. The result was that many new books originally intended for publication in 1946 had to be put off until 1947. Nevertheless, the number of new books printed in 1946 was large, and it may be fairly said that publishers, on the whole, met the demands upon them even more successfully than had been anticipated.

Limitations of space make this survey necessarily selective, many brief or highly technical items being omitted. Readers are advised to consult the Supplement to the *Publications of the Modern Language Association (PMLA)*, which contains a thorough bibliography.*

ENGLISH LANGUAGE

Dialect.—Robert Shafer in "The Language of West Coast Culinary Workers" (*AS*) provided a list of terms in current use among kitchen and restaurant employees in the San Francisco Bay region. Slang words prevalent among the students at the Agricultural and Mechanical College of Texas were listed by Fred Eikel, Jr., in "An Aggie Vocabulary of Slang" (*AS*), while Jesse W. Harris studied "The Dialect of Appalachia in Southern Illinois" (*AS*). Gordon W. Hewes in "American Japanese Place Names" (*AS*) discussed the names by which Japanese-speaking residents of the United States have designated certain cities, towns, states, and natural features of the country.

Words and Terms.—Allen Walker Read's "The Word Harvest of '45"

---

* Periodicals are cited under the following abbreviations: *PMLA*, *Publications of the Modern Language Association of America; MP, Modern Philology; JEGP, Journal of English and Germanic Philology; SP, Studies in Philology; PQ, Philological Quarterly; ELH, English Literary History; HLQ, Huntington Library Quarterly; SAB, Shakspere Association Bulletin; MLQ, Modern Language Quarterly; JHI, Journal of the History of Ideas; ASch, The American Scholar; KR, The Kenyon Review; YR, The Yale Review; CE, College English; AS, American Speech; AL, American Literature; SRL, The Saturday Review of Literature.*

(*SRL*) was an attempt to present the new words that entered the language in 1945, and Henry F. Woods's *American Sayings* (Essential Books) explains the origin and occasion of nearly 300 popular phrases dating from before the Revolutionary War to the present. "Thoughts on 'Yep' and 'Nope'" (*AS*) by Dwight L. Bolinger leads to a discussion of the relevance of gesture to language, and Leo Spitzer's "The Gentiles" (*JEGP*) is an examination of the use of the word in America. Steven T. Byington in "Mr. Byington's Brief Case (IV)" (*AS*) commented on Whittier's rhymes, words from Cooper's works, words from Samuel Hopkins Adams's *Canal Town,* on some railroad terms, on "sugar tree," and on other expressions, while the indefatigable H. L. Mencken in "Bulletin on 'Hon.'" (*AS*) made some interesting remarks on the present status of that honorable abbreviation.

Etymology.—Charlton Laird in "Etymology, Anglo-Saxon, and Noah Webster" (*AS*) examined the great lexicographer's study of Anglo-Saxon and concluded that he was at best a mediocre student although he appreciated its importance for the study of English. "*Res et Verba:* Words and Things" (*ELH*) by A. C. Howell traces through the seventeenth century the use of this combination of words and the idea represented by it. A classical origin is revealed; it was from their study of classical rhetoric that seventeenth century critics learned of it. Leo Spitzer's "Burglar" (*JEGP*) is a commentary upon the origins of the word, with a conclusion that it points to a need for closer collaboration between English etymologists and French lexicographers. Charles H. Livingston in "American English 'Flunk'" (*AS*) expressed his belief that the term is a variation of *funk,* to be traced to Old French *funicle.* Its first use as an American academic slang term seems to have been in a text printed at the beginning of the ninteenth century.

Pronunciation.—In "Notes on the Pronunciation of 'Hurry'" (*AS*), C. K. Thomas supplied data on the two main American pronunciations of the word, while Brobury Pearce Ellis in "Standards in American Speech" (*SRL*) suggested the creation of a research laboratory to deal with the problems of our spoken language, this laboratory to be supported by broadcasting companies and by the publishers of dictionaries. W. Cabell Greet, writing in *Harpers Magazine,* urged British motion picture producers to make some effort to adjust the speech of their actors so that Americans may understand what is being said in English movies.

Usage. — Two stimulating books were published in this connection in 1946: *The Art of Plain Talk* (Harpers) by Rudolf Flesch and *Signs, Language and Behavior* (Prentice-Hall) by Charles Morris. Dr. Flesch's volume is a rewriting of his Ph.D. dissertation, *Marks of Readable Style,* and offers a formula for measuring the readability of writing. Professor Morris' book is the result of the University of Chicago philosopher's 20 years of work in collecting and coordinating the major developments in the field of communication; an invaluable tool for the specialist in semantics, it includes an excellent bibliography. Ivor Brown's "The Pudderers" (*SRL*) commented on the jargon of the learned or of those pretending to rare wisdom, and George Arms' "Cliches, Extended and Otherwise" (*SRL*) provided an analysis of various types of hackneyed phrasing.

Dictionaries.—Among the new dictionaries were *Air Words* (Superior) edited by Fred Hamann, a brief dictionary of the language fliers speak, and *Dictionary of Word Origins* (Philosophical Library) by Joseph T. Shipley, a book dealing with the etymological overtones of words. "Quotations Augmenting the *Dictionary of American English*" (*AS*) by Charles J. Lovell was a random selection from the author's file of 5,000 quotations of Americanisms antedating the material in the *DAE.*

OLD ENGLISH

The view was advanced by Marie Padgett Hamilton in "The Religious

Principle in *Beowulf"* (*PMLA*) that "the theory of grace, alongside the doctrine of Providence, conditioned the poet's view of the past and influenced his interpretation of events and agents in his stories." Kemp Malone, in "Variation in *Widsith"* (*JEGP*), studied the technic of variation in the poem. Erika von Erhardt-Siebold presented solutions to two Old English riddles. In "Old English Riddle No. 4" (*PMLA*), she suggested "hand-mill" as the solution, and in "Old English Riddle No. 39" (*PMLA*), she gave "Hypostasis Death" as the answer to a riddle that has long puzzled scholars of Anglo-Saxon.

MIDDLE ENGLISH AND CHAUCER

A contribution of first importance came from the pen of the noted English scholar E. K. Chambers in *English Literature at the Close of the Middle Ages* (Oxford). W. H. French in "Dialects and Forms in Three Romances" (*JEGP*), studied *Arthour and Merlin, King Alisaunder,* and *Richard Coeur de Lion* as examples of the Midland dialect, while James R. Hulbert in "A Thirteenth-Century English Literary Standard" (*JEGP*) concluded that Versions A and B of the *Ancren Riwle* perhaps were written in a standard language rather than in the dialect of the original.

Considerable Chaucerian scholarship was published in 1946, the work of largest proportions being Marchette Chute's biography, *Geoffrey Chaucer of England* (Dutton). The first really adequate treatment of Chaucer's life, the book was made possible by a half century of research in the archives. Germaine Dempster, in "Manly's Conception of the Early History of the *Canterbury Tales"* (*PMLA*), presents John M. Manly's view of the history of the *Canterbury Tales* to about 1500, indicating in so far as possible the basis for his opinions. Kemp Malone's "Style and Structure in the Prologue to the *Canterbury Tales"* (*ELH*) attempts to show some of the features of the Prologue that make it, in Thomas Wright's words, "one of the most perfect compositions in the English language." Margaret Schlauch in "The Marital Dilemma in the *Wife of Bath's Tale"* (*PMLA*) traces the history of the dilemma of Chaucer's hero in having to choose whether his wife shall be beautiful but of doubtful chastity or ugly and of assured fidelity.

"Chaucer's Originality in the *Nun's Priest's Tale"* (*SP*) by J. Burke Severs reveals that Chaucer did not permit his sources to tyrannize over him but intensified the effect of the tale by the changes he made. In "Chaucer Borrowing from Himself" (*MLQ*), Robert A. Pratt presents two examples of Chaucer's borrowing from his own work: the "Invocations to the Virgin" in the *Second Nun's Prologue* and the *Prioress's Prologue,* and the "Invocations to Venus" in *The House of Fame* and the *Parliament of Fowls.* Paull F. Baum's "Chaucer's Metrical Prose" (*JEGP*), a study of *Melibeus,* reveals that many of Chaucer's prose lines skan so as to form a complete metrical line. Marshall W. Stearns in "A Note on Chaucer's Use of Aristotelian Psychology" (*SP*) contends that Chaucer made frequent use of such psychology, the key words "impress" or "impression" being usually present. A claim that Henry IV honored Chaucer, with whom he was connected by marriage, for his distinguished services to the State by burial in Westminster Abbey is put forth by E. P. Kuhl in "Chaucer and Westminster Abbey" (*JEGP*).

EARLY TUDOR

The possibility of Udall's intending satire upon the Roman rites for the dying and dead is explored by Edwin Shepard Miller in "Roister Doister's 'Funeralls'" (*SP*), while Margaret Church's "The First English Pattern Poems" (*PMLA*) discusses the influence of the *Greek Anthology* on sixteenth century English pattern poetry. Hallett Smith, in "English Metrical Psalms in the Sixteenth Century and their Literary Significance" (*HLQ*), suggests that the various translations of the Book of Psalms in the sixteenth century had a marked influence upon the development of Elizabethan poetry. The same author in "The Art of Sir Thomas Wyatt" (*HLQ*) portrays Wyatt as an artist whose object was not to display himself but to make poems, and one who contributed a directness, energy, and humor unusual among English poets from Surrey to Spenser. In "Renaissance Exploitation of Cavendish's *Life of Wolsey*" (*SP*), Paul L. Wiley shows that George Cavendish's biography had a considerable influence upon Renaissance thought and literature.

AGE OF ELIZABETH

The Queen's own interesting efforts at translation are examined by Geoffrey B. Riddehough in "Queen Elizabeth's Translation of Boethius' *De Consolatione Philosophiae*" (*JEGP*). James Sledd in "Baret's *Alvearie*, an Elizabethan Reference Book" (*SP*). studies the old dictionary as representative of the common knowledge and opinion of the time. "The Allegory of the 'Beare' and the 'Foxe' in Nashe's *Pierce Penilesse*" (*PMLA*). by Donald J. McGinn, is an examination of Thomas Nashe's political indiscretion in introducing the extended fable of the Bear and the Fox into his very popular pamphlet. Helen E. Sandisen in "The Vanytypes of Sir Arthur Gorges Youthe" (*PMLA*) makes a preliminary report on Egerton MS. 3165, the "lost poems" of Sir Arthur Gorges found shortly before its purchase by the British Museum in 1940. In "On Reading John Ford" (*SAB*), John Wilcox examines the attitudes of Ford's British readers throughout the Victorian era and shows the docility of Americans of this century in accepting the verdicts of their "betters." Freda L. Townsend's "Sidney and Ariosto" (*PMLA*), provides evidence to indicate the influence of Ariosto's *Orlando Furioso* upon Sidney's *Arcadia*.

Two Chapman items were provided by Mark Eccles and Johnstone Parr, the former providing in "Chapman's Early Years" (*SP*) new biographical data on the Elizabethan period of the poet's life, and the latter in "The Duke of Byron's Malignant 'Caput Algol'" (*SP*), disagreeing with T. M. Parrott that the Duke in Chapman's play meets his tragic end through his own overweening pride, ambition, and conceit. Parr contends that it was rather the Duke's malignant natal horoscope that Chapman blamed.

MARLOWE

Two new books on Marlowe made their appearance in 1946, one scholarly, the other popular in tone. Paul H. Kocher's *Christopher Marlowe* (North Carolina) is a painstaking study of Marlowe's thought, learning, and character which digs beneath his lines in order to determine their foundation in his ideas and opinions. Charles Norman's *The Muses' Darling* (Rinehart) is an imaginative biography which makes for pleasant reading. A third Marlowe item is Leo Kirschbaum's "Some Light on *The Jew of Malta*" (*MLQ*), which contends that the text as we have it is substantially as the dramatist left it.

JONSON AND OTHERS

Ernest William Talbert in "The Interpretation of Jonson's Courtly Spectacles" (*PMLA*) suggests that, if Jonson's court entertainments are to be interpreted in accordance with his own words, the critic should examine carefully the voice and sense of each masque. Also dealing with Jonson was Edgar Hill Duncan's article, "Jonson's *Alchemist* and the Literature of Alchemy" (*PMLA*), which presents annotations of the most important speeches in the alchemical episodes of the play and provides further evidence of the dramatist's remarkable knowledge of alchemy. *Edmund Campion* (Little, Brown) by Evelyn Waugh is the new American edition of the study by the eminent English novelist first published in England eleven years ago. Arnold Stein in "Donne's Obscurity and the Elizabethan Tradition" (*ELH*) examines Donne's poetry and reveals the mechanical aspects of his obscurity against the backgrounds of the broad

Elizabethan tradition and the general tendency toward obscurity evident as the sixteenth century drew to a close.

SPENSER

Charles E. Mounts in "Virtuous Duplicity in *The Faerie Queene*" (*MLQ*) observes a disposition to employ deception in a good cause among Spenser's most virtuous characters throughout *The Faerie Queene,* and Louis S. Friedland in "Alexander C. Judson's *Life of Spenser*" (*SAB*) compares the new biography with R. W. Church's older one and finds little real progress made. Louise C. Turner Forest's "A Caveat for Critics Against Invoking Elizabethan Psychology" (*PMLA*) inveighs against the "substituting of learned case histories for interpretative and analytical dramatic criticism."

SHAKESPEARE

Samuel A. and Dorothy R. Tannenbaum compiled a valuable "Bibliography of Shaksperiana for 1945" (*SAB*). John Henry de Groot's *The Shakespeares and "The Old Faith"* (King's Crown) is concerned chiefly with the religious background of William Shakespeare and the religious references in his plays. Two other books provided arrangements of the play texts for the modern reader: Babette Deutsch's *The Reader's Shakespeare* (Julian Messner) in which the plays are extensively abridged and paraphrased, and *Shakespeare Arranged for Modern Reading* (Doubleday) edited by Frank W. Cady and Van H. Cartmell, which is designed to present Shakespeare's plays in shortened form to the reader who wants to sample the best of the Bard. The story of each play is related scene by scene, with the celebrated lines retained as Shakespeare wrote them. The omitted passages have been summarized.

Shakespeare articles are numerous. Robert Adger Law, in "Shakespeare and American Scholarship" (*20th Century English*), made a brief and incomplete survey of what American scholars have done in this field, while William S. Knickerbocker's "Shakespeare," which appeared in the same volume, was a re-evaluation of Shakespeare as poet and dramatist. W. Stanley Hoole's "Shakspere on the Ante-Bellum Charleston Stage" (*SAB*) listed Shakespearian performances in the Southern city before the Civil War. Walter Wadepuhl in "Heine and Shakspere" (*SAB*) examined the German poet's knowledge of the Elizabethan dramatist and its influence upon him, while Thomas H. McNeal in "*Henry IV,* Parts I and II, and Speght's First Edition of *Geoffrey Chaucer*" (*SAB*) attempted to clarify Shakespeare's sources for and use of the Chaucer material that is evident.

The year 1946 was productive of the usual controversy between Shakespearian scholars. E. E. Stoll's "An Othello All-Too-Modern" (*ELH*) replies to Leo Kirschbaum's "Modern Othello" (*ELH,* July 1944), taking issue with what Stoll considers to be Kirschbaum's misinterpretations of the play. Perry D. Westbrook, in "A Note on *Macbeth,* Act II, Scene 1" (*CE*), contends that Banquo handed his sword and dagger to Fleance because he was afraid that if he kept them he would use them on the King, and Olive Henneberger in "Banquo, Loyal Subject" (*CE*) offers a refutation of Westbrook's viewpoint, feeling that "it is unwarrantable to conclude that Shakespeare conceived of Banquo as other than an uncompromisingly loyal subject and worthy progenitor of a long line of English Kings!"

There were three articles on *Hamlet.* James Feibleman's "The Theory of *Hamlet*" (*JHI*) finds the objective and subjective schools of criticism wanting and attempts to develop a "realistic interpretation of *Hamlet,* using realism in the philosophical sense." Feibleman finds Hamlet to be a perfectionist who can not accept anything less than his ideal order of things. In "Hamlet and Fortinbras" (*PMLA*), William W. Lawrence examines the structure of the play and expresses reasons for the scenes in which Fortinbras appears. George

L. Barnett's "Hamlet's Soliloquy" (*MLQ*) suggests that a certain similarity of phrasing and of thought between the "To be or not to be" speech and lines from *Belvedere,* compiled in 1600 by John Bodenham, indicates that Shakespeare had newly read the book and was influenced by it.

In "King Lear and the Merlin Tradition" (*MLQ*), Roland M. Smith maintains that Shakespeare drew for the madness scenes upon materials which were available in London before he wrote his tragedy, especially upon works dealing with King Arthur and the marvels of Merlin. "*Measure for Measure* and Christian Doctrine of the Atonement" (*PMLA*), by Roy W. Battenhouse, advances the theory that Shakespeare formed *Measure for Measure* after the pattern of the Christian doctrine of the Atonement.

SEVENTEENTH CENTURY

Wendell Clausen's "The Beginnings of English Character-Writing in the Early Seventeenth Century" (*PQ*) reveals a close correspondence between the comedy of manners and character-writing, as exemplified in Jonson and Overbury. William Peery contends that "The Influence of Ben Jonson on Nathan Field" (*SP*) has been much exaggerated. Treating Thomas Heywood, Allan Holaday in "Heywood's *Troia Britannica* and the *Ages*" (*JEGP*) concludes that, however uncertain the history of their composition may be, the *Ages* are dramatizations of much more than *Troia Britannica,* while Freda L Townsend, in "The Artistry of Thomas Heywood's Double Plots" (*PQ*), holds that "Heywood's dramatic career takes on new and richer meaning if we regard him, not as blown about by the winds of fashion and public favor, but as in search of dramatic patterns which would hold the variety so dear to him."

Charles E. Ward, in "*The Tempest:* A Restoration Opera Problem" (*ELH*), records dissent from the theory that Thomas Shadwell wrote an opera on *The Tempest* and concludes that Thomas Betterton was the more likely author. John Harrington Smith's "Thomas Corneille to Betterton to Congreve" (*JEGP*) traces the influence of *Le Baron d'Albikrac* upon Betterton's *The Amorous Widow,* which in turn influenced *The Way of the World.* In "The Citizens in *Philaster:* Their Function and Significance" (*SP*), Mary Grace Muse Adkins analyzes the play as important in showing the direction of the political winds in early seventeenth century England, while J. Max Patrick writes on the anonymous "*The Free State of Noland,* A Neglected Utopia from the Age of Queen Anne" (*PQ*).

A summary of some of the information contained in the unpublished collection of Smock Alley prologues and epilogues in the possession of Harvard University was made by William Van Lennep in "The Smock Alley Players of Dublin" (*ELH*). That the recent discovery of John Wilson's musical setting for Lovelace's ode *The Rose* reveals several variants of the text not apparent in the printed version, was pointed out by Willa McClung Evans in "*The Rose:* A Song by Wilson and Lovelace" (*MLQ*). G. H. Healey edited *The Meditations of Daniel Defoe* (Cummington Press), the first publication of a small sheaf of verses long lost but now in the possession of the Huntington Library, while Francis Christensen, in "John Wilkins and the Royal Society's Reform of Prose Style" (*MLQ*), surveyed a body of evidence pointing to Wilkins as being primarily responsible for Sprat's *History of the Royal Society* and for the famous committee for improving the English language.

DRYDEN

Two books on Dryden were published in 1946: Thursten Wheeler Russell's *Voltaire, Dryden and Heroic Tragedy* (Columbia), in which the literary relationship of the two writers is explored with care, and Mark Van Doren's *John Dryden, A Study of His Poetry* (Holt), a new printing of a volume which first appeared in 1921 and has been out of print in this country for many years. The Van Doren book contains a revised and enlarged index and has been completely and attractively reset. Other Dryden items include "Dryden's *Georgics* and English Predecessors" (*HLQ*) by Helene Maxwell Hooker, a careful examination of Dryden's translation of Virgil's *Georgics* in which light is thrown on his indebtedness to his English predecessors, particularly Lauderdale and May, from whom he borrowed extensively, and "The Occasion of *An Essay of Dramatic Poesy*" (*MP*) by George Williamson, which explains the delay in publication of the *Essay* and expresses the belief that Dryden had a dual purpose in writing it: to explore and define his own theories of dramatic art and to reply to Sorbière.

MILTON

The year was productive of much Miltonic scholarship. Two books appeared, Davis P. Harding's *Milton and the Renaissance Ovid* (Illinois) and James Holly Hanford's *A Milton Handbook* (Crofts), a fourth edition of a standard work, to which has been added a valuable appendix of 20 pages on the tour Milton made to the Continent in 1638-39. George Coffin Taylor, writing in *20th Century English,* gave in "Why Read Milton Now?" reasons for reading the poet as a force for preventing the "continuation of a crumbling civilization." Donald Lemen Clark, in "Milton's Schoolmasters: Alexander Gil and his Son Alexander" (*HLQ*), gave an account of the men who were Milton's masters at St. Paul's School in London from his tenth to his sixteenth year, and of their publications. Examining Milton's views on marriage and divorce, William Haller, in "Hail Wedded Love" (*ELH*), summed up the poet's reasoning thus: "When it comes about that, in order to save his soul, he who loves must marry and he who is married must love, it follows that, in order to marry and love, a man may have to divorce the woman whom he has discovered to be not in truth part of his soul, his other half." The author points out that Milton's reasoning sprang from an idealistic view of marriage. The relation of Milton's divorce pamphlets to Selden's *De Jure Naturali* and *Uxor Ebraica* was discussed by Eivion Owen in "Milton and Selden on Divorce" (*SP*).

G. F. Sensabaugh contributed "Milton on Learning" (*SP*) in which he established a close relationship between the poet's *De Doctrina Christiana* and his *Paradise* poems, and "Milton in the Revolution Settlement" (*HLQ*), a study of Milton's influence in English political life through his *Pro Populo Adversus Tyrannos,* the anonymously printed adaptation of *The Tenure of Kings and Magistrates.* Leon Howard's "'The Invention' of Milton's 'Great Argument': A Study of the Logic of 'God's Ways to Men'" (*HLQ*) was an analysis of Milton's logic as revealed in his *Artis logicae* and a discussion of its possible relationship to his statement of theme and purpose in *Paradise Lost.*

In "Milton and Thrice Great Hermes" (*JEGP*) William B. Hunter, Jr. attempted to show Milton's relationship to Spenser and to certain Italian Renaissance poets and thinkers, and the relationship of all to the writings of the legendary Thoth, in Milton's words "The Thrice Great Hermes." The same author, in "Milton's Materialistic Life Principle" (*JEGP*), concluded that Milton conceived the Sun as the source of life-giving energy and the entire universe as a chain, of which man is a homogeneous part; the entirety is a unit, created good by God.

Samuel Kliger, in "The 'Urbs Aeterna' in *Paradise Regained*" (*PMLA*), examined the Rome episode in the poem and found the poet independent in the use of the ideas he derived from Scripture, the pagan panegyrists, and the Christian apologists. Edward Wagenknecht's "Milton in *Lycidas*" (*CE*) was a cogitation upon Milton's motives in writing the poem, while Fred Emil Ekfelt's "The Graphic Diction of Milton's English Prose" (*PQ*) was a close examination of Milton's prose style in which his homely graphic diction is pointed out and glorified as both Elizabethan and eminently individual, a fitting complement to the diction of the long poems.

EIGHTEENTH CENTURY POETS

Several Pope items were printed during the year. Maynard Mack, in "On Reading Pope" (*CE*), contends that we habitually deny Pope the kind of close scrutiny his verse demands, while Paul F. Leedy, in "Genres Criticism and the Significance of 'Warton's Essay on Pope'" (*JEGP*), shows that even before the appearance of volume one of Warton's essay, there was some tendency not to regard Pope as the greatest poet of England. Edward H. Weatherly, in "Churchill's Literary Indebtedness to Pope" (*SP*), traces Charles Churchill's debt and concludes that the work of Pope was the most important single literary influence on Churchill's poetic career. That Pope's epistolary satire relied to a considerable degree upon Edward Young's *The Universal Passion,* a series of seven satires published between 1725 and 1728, is the theme of Charlotte E. Crawford's "What Was Pope's Debt to Edward Young" (*ELH*).

In "Gay's Mastery of the Heroic Couplet" (*PMLA*), Wallace Cable Brown contends that Gay's achievements in that form are greater than has been generally recognized. H. W. Starr in "Gray's Craftmanship" (*JEGP*) examines *The Elegy, The Progress of Poesy,* and *The Bard* and concludes that "even if Gray did not have the highest kind of creative imagination . . . at his best he unquestionably turned out exceptionally fine verse, largely as a result of an excellent critical insight and an infinite capacity for taking pains." In one of the best books of the year, *William Blake, The Politics of Vision,* (Holt), Mark Schorer reveals Blake as a powerful, clear-headed, individualistic thinker. The author examines the text of Blake's work to achieve a clearer interpretation of his mind—its torments, ideals, hopes, and creative powers. Explaining his mysticism, he writes: "Blake, partly because when he spoke clearly the world would not listen, assumed the gnostic mask and spoke obscurely."

EIGHTEENTH CENTURY PROSE WRITERS

Newton Demands the Muse (Princeton), by Marjorie Hope Nicolson, showed the influence of Sir Isaac Newton's treatise "Opticks" on English literature in the eighteenth century. F. R. Leavis in "Doctor Johnson" (*KR*) evaluated Krutch's biography, finding it good although he felt that the treatment of Johnson the poet is insufficient and inadequate. Arthur Friedman's "Goldsmith's Contributions to the *Critical Review*" (*MP*) was an attempt to establish an accurate canon of Goldsmith's writings in that journal. "Satire and Comedy in the Works of Henry Fielding" (*ELH*) by W. R. Irvin traced Fielding's progress from satire, as in *The Author's Farce* and *Shamela,* to the comic epic, as in *Joseph Andrews* and *Tom Jones*, and showed that the change from fantasy to reality in representing human action was marked. Rufus D. S. Putney, in "Smollett and Lady Vane's Memoirs" (*PQ*), concluded that the novelist was an active collaborator with Lady Vane in the composition of *Memoirs of A Lady of Quality,* thereby rejecting Howard S. Buck's view in *Study in Smollett* (1925) that Smollett had no hand in it.

An assertion that the depth and diversity of twentieth century Freudian criticism have their counterparts in the psychology of Hutcheson and Hume and their followers was advanced by Martin Kallich in "The Associationist Criticism of Francis Hutcheson and David Hume" (*SP*). A. Owen Aldridge, in "Shaftesbury's Earliest Critic" (*MP*), pointed out that Robert Day, in his *Free Thoughts in Defence of a Future State* (1700), was the first and almost the only critic to stress the logical fallacy in Shaftesbury's denial of a future state. *Essays on the Eighteenth Century* (Oxford) was a volume presented to Prof. David Nichol

Smith of Oxford in honor of his 70th birthday; in it 18 British and American scholars wrote on major and minor literary figures of the period between Anne and George III.

THE ROMANTIC POETS

A work of general interest was "The Romantic Movement: A Selective and Critical Bibliography for the Year 1945" (*ELH*) edited by Charles Frederick Harrold.

Wordsworth.—*A Wordsworth Anthology* (Scribner), edited by Laurence Housman, includes a sound and at times brilliant introduction by the editor. *The Mind of A Poet* (Johns Hopkins) by Raymond D. Havens is a study of Wordsworth's thought, with particular reference to "The Prelude." There are chapters on the parts matter-of-factness, passion, fear, wonder, solitude, silence, loneliness, animism, nature, anti-rationalism, the mystic experience, religion, and imagination played in the thought and poetry of Wordsworth. Francis Christensen's "Creative Sensibility in Wordsworth" (*JEGP*) shows how the poet could place the stress he did on sensation as the source and occasion of knowledge and at the same time view the mind or imagination as creative.

Coleridge.—A new edition of *The Rime of the Ancient Mariner* (Reynal & Hitchcock) was notable for an excellent essay by Robert Penn Warren in which he examined the criticism that formed about the poem and attempted to answer the question of whether or not the poem is essentially logical or illogical. Howard Hall Creed, in analyzing Coleridge's critical theory in "Coleridge on 'Taste'" (*ELH*), wrote: "Coleridge believes . . . in a criticism that keeps its eye on the poem; and his criterion for excellence has its beginning in an Aristotelian 'organic unity'. . . ." He stressed Coleridge's definition of taste as the conscious fusion of a knowing subject and a knowable object, which is the highest creative act possible among men. In "Is Coleridge Indebted to Fielding?" (*SP*), Nettie S. Tillett saw a link between Fielding and passages in *Biographica Literaria*, while Nathan Comfort Starr in "Coleridge's 'Sir Leoline'" (*PMLA*) supported A. H. Nethercot's contention that Coleridge was indebted to Hutchinson's *History of the County of Cumberland* for the name of Christabel's father.

Byron.—The lone Byron item was T. G. Steffan's "Byron Autograph Letters in the Library of the University of Texas" (*SP*), in which the 71 letters in the collection are listed and analyzed.

Keats.—Hyder E. Rollins' *Keats' Reputation in America to 1848* (Harvard) shows the manner in which Keats was sold to the American reading public, and Allen Tate's "A Reading of Keats" (*ASch*) is a re-evaluation of the poet on the 150th anniversary of his birth in which Tate concludes that, even if Keats goes unread by the next generation, he will remain one of the great English poets for a later generation to rediscover. The author questions the capacity of the present generation of readers to receive what Keats has to offer. "The Meaning of Keats's *Eve of St. Mark*" (*ELH*), by Walter E. Houghton, is an examination of the poem from the viewpoint that it is built on the principle of contrast—of the cathedral town and the paneled room—which points to the real antithesis that underlies its meaning. In "Swift and Keats" (*PMLA*), H. E. Briggs shows certain influences on Keats of his reading of Swift, especially echoes of *Gulliver's Travels* in five of Keats' poems. Richard H. Fogle, in "Empathic Imagery in Keats and Shelley" (*PMLA*), contends that Keats' poetry contains many examples of empathy (involuntary projection of oneself into an object), whereas Shelley's, though having emphatic tendencies, contains few. Shelley, says the author, is a poet of sympathy rather than of empathy.

Shelley.—Edmund Blunden's biography, *Shelley: A Life Story* (Viking), although capably written, offered little new material. Robert Metcalf Smith's *The Shelley Legend* was the target of a broadside of scholarly rebuke, the heaviest gun being fired by Newman I. White in *"The Shelley Legend* Examined" (*SP*), who attacked Smith's work as containing "more factual errors, exaggerations, and distortions than the present writer has ever before encountered in any printed book." Frederick L. Jones, in *"The Shelley Legend"* (*PMLA*), examined Professor Smith's book in detail and concluded that it is very unsound and misleading, "a semi-popular and thoroughly unreliable book," while Kenneth Neill Cameron, in "A New Shelley Legend" (*JEGP*), minimized the importance of the work and accused Smith of errors and distortions, particularly as to his picture of Shelley's sex life. Raymond D. Havens' *"Hellas* and *Charles the First"* (*SP*) showed Shelley turning from airy fancy to realism and "growing up" in the dramas and Theodore G. Ehrsam, in "Mary Shelley in Her Letters" (*MLQ*). pointed out certain errors in *The Letters of Mary W. Shelley,* edited by Frederick L. Jones in 1944.

NINETEENTH CENTURY PROSE

Thomas A. Kirby and Eric R. Bentley contributed Carlyle items, Kirby writing on "Carlyle and Irving" (*ELH*) in which he commented on the friendship between Edward Irving and the great essayist and its importance in influencing Carlyle. and Bentley analyzing in "The Premature Death of Thomas Carlyle (1795-1945)" (*ASch*) the decline of interest in Carlyle and lamenting his "premature" death in so far as the reading public is concerned, for "he was partly right, and much more irritatingly right, since he threatens some of our most treasured illusions about human nature and the common man." Theodore Baird, in "Darwin and the Tangled Bank" (*ASch*), examined the famous scientist's concern with literary composition and praised Darwin's ability to unite literature and science. William Blackburn's "Matthew Arnold and the Oriel Noetics" (*PQ*) revealed Arnold's debt to Richard Whately and Renn Dickson Hampden, intimate friends of his father, concerning the point of view which motivates his chief religious works.

Charles Dickens (Howell, Soskin), by Dame Una Pope-Hennessy, while not a new interpretation of Dickens, is a good, exact, straightforward biography which reveals once more how largely autobiographical Dickens' novels are. "Dickens and Mrs. Gaskell" (*HLQ*), by Annette B. Hopkins, tells the interesting story of the 13-year association of Dickens as editor of *Household Words* and *All the Year Round* with Mrs. Gaskell as a contributor of over 30 titles to those journals. Christof Wegelin, in "Dickens and Irving: The Problem of Influence" (*MLQ*), offers a detailed analysis and refutation of T. E. M. Boll's "Charles Dickens and Washington Irving" (*MLQ,* Dec. 1944), which suggested a considerable influence of Irving upon the English novelist.

Howard O. Brogan, in "Rachel Esmond and the Dilemma of the Victorian Ideal of Womanhood" (*ELH*), penned a penetrating analysis of the character of Rachel Esmond, "torn between Victorian martyrdom and primordial jealousy, deceiving herself as well as others by a chameleon-like concealment of secret desire, and against her better will leaving behind her a trail of frustrated loves and broken lives." "Thackeray and Sir Martin Archer Shee" (*PMLA*), by Harold H. Scudder, stated the case for the well known portrait painter, often attacked by Thackeray, as being the original of Mr. Smee in *Vanity Fair* and *The Newcomes*.

Laura L. Hinkley's *Charlotte and Emily: the Brontës* (Hastings House) was a serious if not completely successful study of the sisters which attempted to trace the processes of their genius. Coleman O. Parsons, in "Stevenson's Use of Witchcraft in *Thrawn Janet"* (*SP*), demonstrated Stevenson's adaptation of witch narratives in the writing of this novel, while Gladys W. Ekeberg, in *"The Ordeal of Richard Feverel* as Tragedy" (*CE*), analyzed the progress of Meredith's novel in tone from the comic to the tragic spirit. "The

Source-Book for Hudson's *Green Mansions*" (*PMLA*), by Carlos Baker, revealed that without doubt Hudson followed the general outline of Lady Morgan's novel of 1811, *The Missionary,* and found the original for Rima in it. *George Colman the Younger* (King's Crown), by Jeremy F. Bagster-Collins, is a life of the British playwright, producer, and censor of the Napoleonic era, while Hesketh Pearson produced in *Oscar Wilde: His Life and Wit* (Harpers) the fullest and perhaps the most trustworthy biography of Wilde yet to appear.

NINETEENTH CENTURY POETRY

"Four Letters of Hartley Coleridge" (*HLQ*), by Earl Leslie Griggs, was a printing of four letters discovered since publication of the author's *Letters of Hartley Coleridge* in 1936. Gertrude Reese's "Robert Browning and His Son" (*PMLA*) delved into the poet's career as a father, showing that the responsibility of doing his best for his son was always of first importance to Browning. "A Note on 'My Lady' of *Modern Love*" (*MLQ*), by William T. Going, questioned Sencourt's flat statement in his life of Meredith that Janet Duff Gordon is the "lady" of the sonnet sequence. Going claimed it a critical error to conceive of it as a narrative sequence of Meredith's marriage debacle. *Owen Meredith* (Columbia), by Aurelia Brooks Harlan, is a very able biography of a minor Victorian poet, and Hilton Brown's *Rudyard Kipling* (Harpers) is a critical biography in which the analytical comment is slender but rewarding.

TWENTIETH CENTURY

The year 1946 saw the publication of two books on Thomas Hardy: *Hardy in America* (Colby), by Carl J. Weber, a study of Hardy and his American readers, and *Hardy the Novelist: An Essay in Criticism* (Bobbs-Merrill), by Lord David Cecil, which presented some rather familiar opinions. J. O. Bailey's "Hardy's 'Mephistophelian Visitants'" (*PMLA*) is a study of Hardy's use of "an intruding force or invader to disturb the settled tranquillity of his main characters and to turn the current of their lives at critical points."

In "The Classical Reference in Conrad's Fiction" (*CE*), Robert L. Morris sees in *Lord Jim, Heart of Darkness,* and *Victory* Conrad's attempts to tell the truth about the effort of the civilized to support themselves against encroaching barbarism, while Diana Trilling, in "Lawrence: Creator and Dissenter" (*SRL*), provides an analysis of what lay behind Lawrence's work. Two Joyce items were Harry Levin's "James Joyce" in *The Atlantic Monthly,* an appreciation of Joyce in which he is termed "the Writer's Writer," and Adrienne Monnier's "Joyce's *Ulysses* and the French Public" (*KR*), reflections by the first publisher of the French translation of the book. Woodburn O. Ross' "W. Somerset Maugham: Theme and Variations" (*CE*) is a critical analysis of Maugham's fiction in which the novelist is held not to have enlarged his view of life since *Of Human Bondage*.

Frederick J. Hoffman, in "Aldous Huxley and the Novel of Ideas" (*CE*), contends that Huxley is no longer a novelist. "His recent novels are lengthy essays, to which are added entertainments. But his novels of the 1920's *are* novels of ideas . . ." Lee Elbert Holt, in "E. M. Forster and Samuel Butler" (*PMLA*), argues that Forster should be placed second only to Shaw in any hypothetical list of disciples of the Victorian novelist. "'Vision and Design' in Virginia Woolf" (*PMLA*), by John Hawley Roberts, expresses the belief that Mrs. Woolf's writings were influenced by her association with and reading of Roger Fry and that an understanding of Fry's theories will illuminate one's reading of Mrs. Woolf. Charles Richard Sanders's "Lytton Strachey Improves His Style, 1904-22" (*CE*) analyzes the revisions made for *Books and Characters,* and Chad

Walsh, writing in *The Atlantic Monthly,* states, in "C. S. Lewis, Apostle to the Skeptics," that the importance of Lewis is that "he is one of the few Christian apologists who can both write simply and at the same time avoid infuriating the more sophisticated readers by a pulpit vocabulary or the Sunday school flavor of piety."

E. K. Brown's "Two Formulas for Fiction" (*CE*) is an analysis of the methods of Henry James and H. G. Wells, stemming from Wells' charge that James over-unified his novels. Also treating Wells was "H. G. Wells Sees It Through" (*SRL*), a series of essays by Henry Seidel Canby, Elmer Davis, Clifton Fadiman, and Waldemar Kaempffert in appreciation of Wells and occasioned by his death. *J. B. Yeats: Letters to His Son W. B. Yeats and Others 1869-1922* (Dutton), edited by Joseph Hone, contained memories, opinions, conversations, quarrels, and descriptions of famous men who lived before and during the Irish Renaissance. Two interesting Housman items were a jubilee edition of *A Shropshire Lad* (Colby), with notes and a bibliography by Carl J. Weber, containing also a check list of the Colby College collection, tributes to Housman during the last 50 years, criticism, commentary, and textual exegesis, and Laurence Housman's "A Poet in the Making" in *The Atlantic Monthly,* in which A. E.'s brother commented on his development as a poet and on the manner in which he composed.

Shaw items included *G. B. S. 90* (Dodd, Mead), edited by S. Winsten, which is a collection of personal tributes to Shaw published on his 90th birthday; "Shaw as Social Critic" (*SRL*), by J. B. Priestley, in which the British novelist and essayist points out, that throughout his social criticism, Shaw has adhered to two ideas: that theory and practice must correspond, and the conception of the community as a living whole; and two articles by Eric Bentley, "Shaw at Ninety" in *The Atlantic Monthly,* an evaluation of G. B. S. which finds him a failure as a propagandist but not as a teacher, and "Bernard Shaw's Politics" (*KR*), which shows Shaw's politics to be part and parcel of Shaw's philosophy.

AMERICAN LITERATURE

Turning to the American scene, we find two articles on Edward Taylor, Nathalia Wright's "The Morality Tradition in the Poetry of Edward Taylor" (*AL*), which suggests that he was led to that tradition by a combination of influences: a keen dramatic sense, a congeniality with the thought of the Middle Ages, and long habits of theological speculation; and Willie T. Weathers' "Edward Taylor, Hellenistic Puritan" (*AL*), which notes that in *God's Determinations* the dialogue between Justice and Mercy follows the conventional pattern of a Theocritan song contest. George Snell, in "Washington Irving: A Revaluation" (*MLQ*), claims that Irving exerted a marked influence on other American writers of his time and unconsciously shaped a principal current in American fiction, Hawthorne, Longfellow, and J. P. Kennedy being among those directly influenced.

Russell Kirk in "Cooper and the European Puzzle" (*CE*) examines *The Bravo, The Heidenmauer,* and *The Headsman,* and shows Cooper's analysis of the dangers in government. In these books the novelist "struck resolute blows at tyranny in the guise of liberty and offered America a warning which this nation heeded little." In "Hawthorne's Use of Three Gothic Patterns" (*CE*), Neal Frank Doubleday sees these patterns appearing and recurring in Hawthorne's tales and romances: (1) mysterious portraits; (2) witchcraft; (3) the esoteric arts or researches which would break through the limitations of mortality. Randall Stewart, in "The Growth of Thoreau's Reputation" (*CE*), traces the history of that reputation and suggests reasons for Thoreau's increasing popularity today. For Whitman, Gay Wilson Allen published a valuable *Walt Whitman Handbook* (Packard).

HERMAN MELVILLE

There were several Melville items. Egbert S. Oliver, in "Melville's Picture of Emerson and Thoreau in *The Confidence-Man*" (*CE*), made out a case for Emerson as the prototype for Mark Winsome, the mystic, and for Thoreau as the basis for Egbert, his disciple. John C. McCloskey's "*Moby Dick* and the Reviewers" (*PQ*) is an examination of the critical reception of the novel in England and America and showed that, contrary to the general impression, the book was given many favorable reviews and was treated with wide respect. In "Taji's Quest for Certainty" (*AL*), Tyrus Hillway found in the adventure of the fifth pilgrim on the isle of Maramma a parallel of the main allegory in Melville's *Mardi*. Robert Penn Warren's "Melville the Poet" (*KR*) contained remarks on the poetry, supplementary to the preface of F. O. Matthiessen's *Selected Poems of Herman Melville*.

Lafcadio Hearn (Houghton Mifflin), by Vera McWilliams, is a valuable new biography throwing much light on Hearn and on Japan, while Ferris Greenslet's *The Lowells and Their Seven Worlds* (Houghton Mifflin) includes good chapters on James Russell Lowell and Amy Lowell. A correspondence which tells much about Amy Lowell's theories and practice in verse and prose is printed in *Florence Ayscough and Amy Lowell* (Chicago), edited by Harley F. MacNair.

MARK TWAIN

Mark Twain continued to be a popular figure. Edgar M. Branch published "A Chronological Bibliography of the Writings of Samuel Clemens to June 8, 1867" (*AL*), while Samuel Charles Webster edited *Mark Twain, Business Man* (Atlantic—Little Brown), the business and family correspondence of the author, representing what is probably the last large collection of heretofore unpublished Mark Twain material. The editor is the son of Twain's close friend and business partner and is himself a great-nephew of Twain. John W. Hollenbach, in "Mark Twain, Story-Teller, at Work" (*CE*), studied Twain's creative method in the humorous short story, and Mary A. Wyman in "A Note on Mark Twain" (*CE*) made a comparative analysis of the "Paladin" in *Personal Recollections of Joan of Arc* and his creator. John B. Hoben's "Mark Twain's *A Connecticut Yankee:* A Genetic Study" (*AL*) reviewed the manner in which the great humorist's satire came into being.

BAYARD TAYLOR AND HOWELLS

"Bayard Taylor and Goethe" (*MLQ*), by A. J. Prahl, is an attempt to show that Goethe's and Taylor's attitudes toward life and the world were strikingly alike, and that both were leaders of their generations in the struggle for new conceptions with regard to the individual and to mankind at large. Howells was treated by George Snell in "Howells' Grasshopper" (*CE*), an analysis of the writer in which he is made out to be the fountainhead of realism in American fiction, who merits the reproach of having drawn up a program only to erase half of it in the process, and by Edwin Harrison Cady in "The Neuroticism of William Dean Howells" (*PMLA*), in which Howells' early life is explored to show why he shunned a direct approach to the brutal realities of American life. His adolescent psychical difficulties were responsible for his neuroticism, according to Cady.

HENRY JAMES

The reborn popularity of Henry James resulted in a considerable amount of writing about him. *The Question of Henry James* (Holt), edited by F. W. Dupee, is a collection of critical essays (25), the earliest by Thomas Wentworth Higginson (1879) and the three latest by Jacques Barzun, William Troy, and Philip Rahv (1943). Howells, Conrad, Beerbohm, T. S. Eliot, Van Wyck Brooks, V. L. Parrington and others are represented. "The Spoils of Henry James" (*PMLA*), by Adeline R. Tintner, is an examination of "the work of art" in James's fiction, while "The Sentence Structure of Henry James" (*AL*), by R. W. Short, represented observations made upon the novels of the period 1901-1904. "Henry James and the New Jerusalem" (*KR*), by Quentin Anderson, described the theology of the elder James and applied it to some of the son's works. Entertaining reminiscences of a tenant of James and letters from him which reveal him as a kind and considerate landlord were to be found in Louise Boit's "Henry James as Landlord" in *The Atlantic Monthly.*

HARRIS AND BIERCE

John Stafford's "Patterns of Meaning in *Nights with Uncle Remus*" (*AL*) was a study of the "literary strategy" of Harris in the Uncle Remus volumes, while Clifton Fadiman's "Portrait of a Misanthrope" (*SRL*) showed Ambrose Bierce to be a writer whose bitterness and pessimism are strikingly modern. An appreciation of the style of Willa Cather, inspired by her 70th birthday, was E. K. Brown's "Homage to Willa Cather" (*YR*).

DREISER

The death of Theodore Dreiser brought out several articles. Howard Mumford Jones, writing in *The New York Times Book Review,* analyzed his position in American literature. His article, "Theodore Dreiser—a Pioneer Whose Fame Is Secure," states that he is the first American novelist to say that life is a problem in amorality. Francis Ludlow's "Plodding Crusader" (*CE*) was an astute analysis of Dreiser the man and of his works. At his worst, says Ludlow, he is an honest though blundering story-teller; at his best, he approaches genius. Woodburn O. Ross, in "Concerning Dreiser's Mind" (*AL*), concluded that Dreiser should never be called a mystic although at times he presents the mystic's position sympathetically.

OTHERS

In "F. Scott Fitzgerald" (*KR*), John Berryman expresses the conviction that *The Great Gatsby* is a masterpiece, but that its author, succumbing to the popularity formula, never thoroughly exercised his gift again. And in "Wolfe's Genius Seen Afresh," by Franz Schoenberner, in *The New York Times Book Review,* a German evaluates Thomas Wolfe and terms him the only one among serious contemporary writers to be endowed with "the prophetic Ethos and poetic Pathos of the true genius." Warren Beck's "E. B. White" (*CE*) is in praise of "the modern Thoreau."

AMERICAN DRAMA

In the field of drama, Samuel Kliger in "Hebraic Lore in Maxwell Anderson's *Winterset*" (*AL*) points to the extent to which rabbinical wisdom permeates the play, and Eric Bentley, writing in *The Atlantic Monthly,* analyzes *The Iceman Cometh* in "The Return of Eugene O'Neill."

An analysis of the verse of "Karl Shapiro: Poet in Uniform" (*CE*) was made by Dayton Kohler, and Horace Gregory and Marya Zaturenska published *A History of American Poetry 1900-1940* (Harcourt, Brace), a reasonably comprehensive account of twentieth century American verse, critically competent, with interesting biographical data on the poets.

GERMANIC LANGUAGES AND LITERATURES

By Richard Jente
Head, Department of Germanic Languages and Literatures,
University of North Carolina

BIBLIOGRAPHY

The most comprehensive and reliable bibliography for the Germanic languages and literatures is that compiled annually by Henry W. Nordmeyer for the *PMLA** Supplement. While this includes only writings of Americans, that by J. G. Kunstmann, "Recent Literature of the Renaissance: D. Germanic Languages," *SP* (April), records the productions of foreign scholars as well. The *GR* lists books received, while the *MfdU* annually lists alphabetically the members of departments at our colleges and universities and their publications. The *AGR* contains interesting and illuminating information concerning early German settlers in America and also biographies of prominent Americans of German origin who have made significant contributions to American civilization. It also brings in the April issue (pp. 29-35) a bibliography "Americana Germanica, 1945." The *ASR* covers similar achievements of Americans of Scandinavian origin and a bibliography of Scandinavian Americana. L. M. Price lists an extensive "Anglo-German Literary Bibliography for 1943-1944" (*JEGP*, 45, 97-102) and "Anglo-German Bibliography for 1945" (*JEGP*, 45, 337-339). Scholars interested in publications in our fields printed in Germany and Scandinavia will welcome the compilation made in Germany by Otto Springer, "Germanic Bibliography 1940-1945, Books and Articles in the Field of Germanic Philology Published in Europe, Especially in Germany and in the Scandinavian Countries during the War" (*JEGP*, 45, 251-326).

ANNIVERSARY PUBLICATIONS

The year 1946 marked the 400th anniversary of the death of Martin Luther; yet only a small number of articles in commemoration of the event have been noted: Werner Richter, "Wandlungen des Lutherbildes und der Lutherforschung" (*MfdU*, 38, 129-149); Heinz Blum, "Die Lebensform des lutherischen Menschen und ihr Schicksal" (*MfdU*, 38, 193-207); Paul Nettl, "Luther, the Musician" (*AGR*, 13, Aug., 12-15). The 300th Leibnitz anniversary is remembered, with emphasis on his influence on German thought by Heinrich Meyer, "Gottfried Wilhelm Leibnitz, 1646-1716" (*MfdU*, 38, 257-267). The following fall under the category of anniversary papers: Walter Gausewitz, "Richard Dehmel nach einem Vierteljahrhundert" (*MfdU*, 38, 533-538); J. F. L. Rachen, "American-German Journalism a Century Ago" (*AGR*, 13, June, 13-15); Hermann Barnstorff, "Pan, Jugend, und Simplicissimus ein fünfzigjähriger Rückblick" (*MfdU*, 38, 284-292).

LITERARY CRITICISM

We have noted but few articles in this category. The following are significant: Helmut Rehder, "Literary Criticism in Germany during the Romantic Period" (*MfdU*, 38, 237-243); Werner Richter, "Strömungen und Stimmungen in den Literaturwissenschaften von heute" (*GR*, 21, 81-113). Here belongs perhaps John R. Frey's "The Historical Present in Narrative Literature, Particularly in Modern German Fiction" (*JEGP*, 45, 43-67).

EARLY LITERATURE AND LANGUAGE

A dissertation by Donald A. McKenzie, *Otfrid von Weissenburg: Narrator or Commentator? A Comparative Study,* has recently been published by Stanford University Press. E. H. Zeydel has continued his researches on Hrotsvitha and raises 14 points of doubt that her works are a hoax, "The Authenticity of Hrotsvitha's Works" (*MLN,* 61, 50-55; 281-283). Frances H. Ellis has outlined in detail a MS compiled by Hans Sachs about 1517, containing 399 Meisterlieder by 24 masters, with a complete index of first lines and indication of poet and "Ton," "Analysis of the Berlin MS *Germ. Quart. 414*" (*PMLA,* 61, 947-996). The content of the songs in the MS is treated by Sister Mary Juliana Schroeder: "Topical Outline of Subject Matter in the Berlin MS *Germ. Quart. 414*" (*PMLA,* 61, 997-1017). J. H. Scholte gives a new interpretation of the leading prose work of the seventeenth century: "Grimmelshausens *Simplicissimus* als verhüllte Religionssatire" (*PMLA,* 61, 1060-1086).

EIGHTEENTH CENTURY

Edith A. Runge has written a dissertation *Primitivism and Related Ideas in "Sturm und Drang" Literature,* published by the Johns Hopkins Press. R. T. Clark, Jr., has continued his researches on Herder with two articles: "Hamann's Opinion of Herder's 'Ursachen des gesunkenen Geschmacks'" (*MLN,* 61, 94-99); "Herder, Percy and the *Song of Songs*" (*PMLA,* 61, 1087-1100).

GOETHE AND SCHILLER

Here we have noted the following articles: John Henning, "Goethe's Translations of Ossian's *Songs of Selma*" (*JEGP,* 45, 77-87); Arnold Bergstraesser, "Die Erziehungsweisheit des alten Goethe" (*MfdU,* 37, 546-554); A. J. Prahl, "Bayard Taylor and Goethe" (*MLQ,* 5, 205-217); Ernst Jockers, "Faust und Meister, zwei polare Gestalten" (*GR,* 21, 118-131). A contrast in philosophy of life has been offered in a series of articles by Bernhard Blume, "Kleist und Goethe" (*MfdU,* 38, 20-31; 83-96; 151-164). F. H. Reinsch has published *The Correspondence of Johann Caspar Goethe,* the father of the poet (Univ. of Calif. Publ. in *Mod. Philol.* 28, no. 2, VI, 25-62). The dictionary to Goethe's Faust compiled under the direction of A. R. Hohlfeld has now been completed, *Der Wortschatz der Bühnenprosa in Goethes "Faust,"* the work of Paul M. Kittel and Norbert Fuerst (Madison, Wis.). The only outstanding article on Schiller that we have seen is that by Melitta Gerhard, "Schillers 'Götter Griechenlands' in ihrer geistesgeschichtlichen Bedeutung" (*MfdU,* 38, 32-43).

NINETEENTH CENTURY

This period has attracted the largest number of investigators. A comprehensive and thorough series of articles offering new interpretations is that by Henry W. Nordmeyer, "Kleists 'Amphitryon.' Zur Deutung der Komödie" (*MfdU,* 38, 1-19; 165-176; 268-283; 349-359). Jacquelin A. MacNaughton's dissertation on *Brentano's Novellen* has been published in part by New York University. Two articles on other Romanticists are: Wolfgang Paulsen, "Friedrich Schlegels 'Lucinde' als Roman" (*GQ,* 19, 173-190); Stuart Atkins, "Peter Schlemihl in Relation to the Popular Novel of the Romantic Period" (*GQ,* 19, 191-208). Walter Wadepuhl, "Heines Geburtsjahr" (*PMLA,* 61, 126-156), establishes definitely the birth date as Dec. 13, 1797, and states all facts leading to the confusion. Dorothy Lasher-Schlitt, "Hebbel, Grillparzer and the 'Wiener Kreis'" (*PMLA,* 61, 492-521), gives a minute account of the isolation of Hebbel from the literary circle in Vienna, emphasizing especially his relations with Grillparzer. J. D. Wright gives a reinterpretation of Hebbel's *Maria Magdalene* in "Hebbel's Klara. The Victim of a Division in Allegiance and Purpose" (*MfdU,* 38, 304-316). Marianne Thalmann has treated Stifter in several articles: "Das Menschentum in Stifters 'Haidedorf'" (*MLN,* 61, 361-372); "Stifters

Nachfolge Goethes" (*JEGP,* 45, 133-139); "Adalbert Stifters Raumerlebnis" (*MfdU,* 38, 103-111). Walter Silz, "Theodor Storm's 'Schimmelreiter'" (*PMLA,* 61, 762-783), produces cogent evidence to show this to be Storm's masterpiece. E. O. Wooley has continued his researches on Storm with an article "The Literary Relations of Storm with His Children" (*MfdU,* 37, 517-532). H. Reichert analyses "Gottfried Keller's Conception of Freedom" (*MfdU,* 38, 65-82).

CONTEMPORARY LITERATURE

As always, the modern writers of the past generation and those still active attract the attention of a large number of investigators and commentators. Here only a selection of writings can be presented. Those authors whose work is ended are to be treated first. Max Lederer, "Einige Bemerkungen zu Adolf Wilbrandts *Der Meister von Palmyra*" (*MLN,* 61, 551-555), remarks on the effect of this once popular play upon Mark Twain who saw it in Vienna; F. K. Richter, "Gegenwärtiger Stand der Stehr-Forschung und einige ihrer Probleme" (*MLQ,* 5, 317-327); J. C. Blankenagel presents a comprehensive study of "Jakob Wassermann's Conception and Treatment of Character" (*MLQ,* 5, 3-20).

Of the several recent estimates of Ernst Toller and his works, the following is the most sympathetic and comprehensive: W. A. Willibrand, *Ernst Toller and His Ideology* (Univ. of Iowa Humanistic Studies, vol. VII), 1945. Franz Werfel is viewed from various angles by A. D. Klarmann, J. R. Frey, and Max Lederer in a series of articles (*GQ,* 19, 113-120; 121-128; 129-131). The poems of Franz Werfel have been translated by Edith Abercrombie Snow (Princeton Univ. Press, 1945).

The death of Gerhart Hauptmann in June, 1946 called forth a large number of articles: Felix A. Voight, "Gerhart Hauptmann unter der Herrschaft des Nazismus" (*MfdU,* 38, 298-303); Walter A. Reichart, "The Totality of Hauptmann's Work" (*GR,* 21, 143-149); F. B. Wahr, "Gerhart Hauptmann's Shorter Poems" (*GQ,* 19, 215-229; Oskar Seidlin, "Gerhart Hauptmann zum Gedenken" (*MfdU,* 38, 332-337); Walter Reichart, "Zu Gerhart Hauptmanns Tod" (*MfdU,* 38, 323-331); F. A. Klemm, "Gerhart Hauptmann, in Memoriam" (*AGR,* 13, Oct., 39-40).

Frank X. Braun has written a dissertation *Kulturelle Ziele im Werk Gustav Frenssens* (Ann Arbor). Walter H. Perl surveys the activity of *Thomas Mann 1935 bis 1945* (New York), publishing material from close association with the author. Max Lederer has presented a brief survey: "Recent Drama in Germany" (*GQ,* 19, 176-180).

Ernst Wiechert, a frail and sensitive man, who suffered in concentration camps for his anti-Nazi convictions, is receiving deserved attention in this country: Arnold Bergsstraesser, "Das einfache Leben. Zu dem Roman von Ernst Wiechert" (*MfdU,* 38, 293-297); B. Q. Morgan, "Ernst Wiechert's *Hirtennovelle,* Versuch einer Stilanalyse" (*GQ,* 19, 274-282); Oskar Seidlin, "Begegnung mit Ernst Wiechert" (*GQ,* 19, 270-273).

The recent announcement that Hermann Hesse was awarded the Nobel Prize for Literature should arouse deserved interest in this German novelist, who for many years has lived in voluntary exile in Switzerland.

GERMANS IN AMERICA

As noted above under "Bibliography," the *AGR* is particularly dedicated to this field and should be read especially by all those Americans of German descent interested in their heritage. A thorough study of what types of German literature were brought to the attention of the Germans of the central west during the latter half of the nineteenth century has been compiled by Erich P. Hofacker, *German Literature as Reflected in the German-Language Press of St. Louis Prior to 1898* (Washington Univ. Studies, 16, St. Louis). Two further items should be noted: A. J. Prahl, "An Unpublished Letter of Bayard Taylor" (*MLN,* 61, 55-57);

Oskar Seidlin, "Frank Wedekind's German-American Parents" (*AGR*, 13, Aug., 24-26).

TEACHING OF GERMAN IN AMERICA

Among the many articles in the pedagogical journals (*MfdU, GQ, MLQ,* etc.) on methods of teaching German, the most significant is the January (1946) number of the *GQ* which is devoted entirely to "A Symposium on Intensive German Courses for Civilians," which is a report on intensive courses as carried on in 17 leading institutions.

SCANDINAVIAN LANGUAGES AND LITERATURES

The American-Scandinavian Foundation (New York) has sponsored three recent publications: Henry G. Leach, *A Pageant of Old Scandinavia* (Princeton U. Press); Søren Kierkegaard, *Works of Love,* translated from the Danish by David F. Swenson and Lillian M. Swenson (Princeton U. Press); *Four Plays by Holberg,* translated by Henry Alexander (Princeton U. Press). Lee M. Hollander has investigated consonant riming in Old Norse poetry: "Observations on Skaldic Rime Usage with Special Reference to the *dunhent* and *liðhent* Varieties of *dróttkvætt*" (*PMLA,* 61, 891-909). Madelaine R. Brown and F. P. Magoun have analysed a Norse saga giving information of the trip to Vinland of "Tyrkir, First German in North America" (*MLN,* 61, 547-551). The *ASR* brings numerous articles of particular interest to Americans of Scandinavian origin. *Scandinavian Studies and Notes* contains many short articles on aspects of the Scandinavian languages, especially of the ancient periods, and also notes on the literature of Scandinavia.

ROMANCE LANGUAGES AND LITERATURES

By Ernest Richard Moore
Associate Professor, Oberlin College

GENERAL

As more and more veterans returned to already over-crowded classrooms throughout the United States, the number of teachers employed rose sharply. They filtered up through the instructional system and brought with them a lower teaching standard. A rising cost of living caused many teachers to abandon their profession for more lucrative employment. Some adjustment of salaries to real dollar value is now taking place and may, if it continues, counteract a dangerous exodus from the teaching profession.

Teachers of romance languages have met the general unrest of the post-war period, as well as the upsurge of interest in languages, by reexamining the ends and methods of language instruction. Thus the ASTP intensive language program is being experimented with at such institutions as Cornell University and has received considerable publicity in the language journals (for example, *Hisp*[1] 90 *et passim,* and *MLJ* 89-97). The appearance of *Planning the Modern Language Lesson* (Syracuse) indicates that these new ideas are still consonant with past experiences. A welcome project to establish national norms of various language skills is under way (*Hisp* 31-37).

Brazilian Portuguese studies have

---

[1] The following abbreviations are used in this section. Numbers refer to the pagination of the 1946 issues of the journal. *BA, Books Abroad; FR, French Review; HAHR, Hispanic American Historical Review; Hisp, Hispania; HR, Hispanic Review; Ital, Italica; L, Language; MLF, Modern Language Forum; MLJ, Modern Language Journal; MLN, Modern Language Notes; MLQ, Modern Language Quarterly; MP, Modern Philology; PMLA, Publications of the Modern Language Association; PQ, Philological Quarterly; RFH, Revista de Filología Hispánica; RHM, Revista Hispánica Moderna; RI, Revista Iberoamericana; RR, Romanic Review; S, Speculum; SP, Studies in Philology.* University presses are indicated by the name of the institution alone.

increased, supporting the desire of many Americans to admit the third American language into our school system.

BIBLIOGRAPHY

General.—Chandler's valuable *Bibliographical Guide to the Romance Languages and Literatures,* compiled by Palfrey, Fucilla, and Holbrook, was brought to date in a third edition. A continuing "Annotated Bibliography of Modern Language Methodology" (*MLJ* 290-308) by W. H. Rice added 209 items to Coleman's *Analytical Bibliography* (1938). The yearly survey, "Recent Literature of the Renaissance" (*SP* 275-460), contained important Italian, Spanish, and French sections. The *RFH* and *RHM* contained a delayed but continuous general Spanish bibliography. R. U. Pane's *English Translations from the Spanish, 1484-1943* (Rutgers), though containing some errors, is a handy guide to the literature of Spain.

Italian.—Giuseppe Prezzolini's impressive *Repertario bibliografico della storica e della critica della letteratura italiana dal 1932 al 1942* (Vanni), volume 1 (A to L), carries forward that series. O. Bontempo's rapid survey of "Italian Literature in the War Interim (1939-45)" (*MLJ* 462-474) included Italian and American items. V. Luciani's annotated bibliography of current Italian studies in America appeared in each issue of *Italica*. This review dedicated issues to H. D. Austin and E. H. Wilkins, giving lists of their writings (131-135, 260-266). V. Scanio compiled an excellent annotated supplement to Rossi's (1896) work on "The *Collezione Giordani*" (*Ital* 189-236).

French.—Otis Fellows listed over 75 periodicals, their editors and contributors, in *The Periodical Press in Liberated Paris* (Syracuse). "Anglo-French and Franco-American Studies" (*RR* 105-126) annotated scholarly publications for 1945. H. Kurz published the first "Critical Bibliography on La Boétie" (*RR* 20-36).

Spanish. — Bibliographers offered guidance to the unfolding literatures of Latin American countries in numerous articles. R. Grismer continued his series on the literatures of Spain and Spanish America (Perine). J. M. Hill presented the first careful listing of known or ascribed works of Rodrigo de Reynosa (*HR* 1-21). L. L. Barrett continued his "Theses Dealing with Hispano-American Languages and Literatures" (*Hisp* 220-221). Mexican items: B. Udick, "Bibliografía de Manuel José Othón" (*RI* 351-378), poet; P. Radin published part 3 of his "Annotated Bibliography of the Poems and Pamphlets of Fernández de Lizardi" (*HAHR* 284-291); E. R. Moore, "Una bibliografía descriptiva de *El Periquillo Sarniento*" (*RI* 383-403), a novel by Lizardi. F. B. Steck added to research tools *A Tentative Guide to Historical Materials on the Spanish Borderlands* (Catholic Historical Society). J. T. Reid, aided by leading Cuban writers, compiled an annotated "best book" list: "Knowing Cuba through Books" (*Hisp* 494-499).

Portuguese.—"Portuguese Literature" (*Hisp* 561-567), by M. Ciley, lists 109 authors by subject. Apropos of Manuel de Paiva Boléo's compilation of studies in Portuguese philology, F. M. Rogers' additions (*Hisp* 613-627) filled regrettable lacunae.

LANGUAGE

General. — The rift between neogrammarians and eclectics is seen in R. A. Hall, "The State of Linguistics" (*Ital* 30-34) and "The Neo-grammarians" (*RR* 244-255), opposed by M. A. Pei, "The State of Linguistics: Reply to a Mechanist" (*Ital* 237-240). G. Bonifont re Vegliotic Latin *ce* and *ci* offered "The Spread of Phonological Change" (*PMLA* 1-6). Frank Gaynor edited a practical polyglot (English, German, French, Spanish, Italian) *International Business Dictionary* (Philosophical Library); and P. M. Spurlin wrote interestingly on "The Founding Fathers' Knowledge of French" (*FR* 120-128).

French. — "Old Provençal *saig,* 'hangman,' and two poems on *jongleurs* by Cervervi de Girona" (*ML* 411-444), by K. Lewent, contains the full texts and excellent notes. U.

Holmes traced "Old French *grifaigne* and *Grifon*" (*SP* 586-594) to determine sense and development. R. A. Hall made an attempt at systematic reconstruction of "Old French Phonemes and Orthography" (*SP* 575-585), and P. Delattre (*PMLA* 7-41) postulated certain phonemic changes in OF by studying phonetic stages in the more accessible modern French. By means of "Linguistic investigation of Old French high spirituality" (*PMLA* 331-369), H. A. Hatzfeld revealed a neglected mystic vocabulary which he appended in a table together with Latin and Spanish parallel terms. The erudite L. Spitzer was active: "Suffixes masculins dans les prénoms féminins en français" (*RR* 127-149), "La particule 'mon'" (*PMLA* 607-619), "Turpulin" (*MLN* 104-108), "Yiddisch (t)schale(n)t Französisch chaud?" (*MLN* 101-104). C. H. Bissell's history of "The Word *demitasse*" (*MLN* 340-343) is enlightening. R. Hardré and M. K. Hooke continued their "Notes sur la traduction du pronom personnel anglais sujet de la troisième personne" (*FR* 24-32) with convincing citations from modern French writers.

Spanish.—Yakov Malkiel contributed a solid discussion on the phonology, word formation, and etymology of "Castilian *albricias* and its Ibero-Romance congeries" (*SP* 498-521) and "The Word Family of Old Spanish *recudir*" (*HR* 104-159). R. Lida and A. Alonso illustrated end-of-syllable consonant relaxation in "Geografia fonética: -l y -r implosivas en español" (*RFH* 313-345). L. Spitzer studied "Enaziado, anaciado" (*RFH* 160-162), "Lerdo" (*RFH* 43-44), "Anc. Prov. *aib*—Anc. esp. *aleve*" (*MLN* 419), "Valencia la bella" (*RFH* 259-276), "Arrenquín" (*RFH* 281-282). G. Bonfante appended an additional note to his 1943 study of "El nombre de Cataluña" (*RFH* 389-390). R. L. Predmore reported his observations on Guatemalan Spanish: "Dobletes modernos" (*Hisp* 213-215) and "Pronunciación de varias consonantes" (*RFH* 277-280). An amusing catalog of "English Terms in Bogotá" (*Hisp* 55-66) and observations on "Current Variations in the Past Indicative Uses of the *-ra* Form" (*Hisp* 355-362) was offered by C. N. Staubach; W. Wilson reported English words used in Mexico (*MLJ* 345-346). Pleasant and instructive is L. Crespo's "Los verbos ser y estar" (*Hisp* 45-55), describing *estar* as an indicator of comparative conditions. "The future and conditional of probability" (*Hisp* 363-375) may be safely taught principally as modes of the "be" and "have" verbs employed orally, according to D. Bolinger. E. F. Helman found sufficient data to prove the existence of "Early Interest in Spanish in New England (1815-35)" (*Hisp* 339-351).

Italian.—H. D. Austin asked "Does Dante Mention Clover?" (*PMLA* 585-588) and clarified the meaning of "The Noun *mena* in the Divine Comedy" (*S* 237-240). The origin of "Il nome dell'Abruzzo" (*Ital* 18-22) was traced by G. Bonfante; the etymology of "It. *vogare, voga*" (*Ital* 23-29) occupied L. Spitzer. *Palamarium* in its relations to *paloma* and *palomar* was investigated by Henry and Renée Kahane (*Ital* 178-188). L. Sandri and W. Kaulfers devised "An Aural Comprehension Scale in Italian" (*Ital* 335-351) to determine readiness to participate in normal speech situations.

Portuguese.—F. Rogers, in "Insular Portuguese Pronunciations in Madeira" (*HR* 235-253), distinguished it from standard Lusitanian by eight characteristic phonetic differences; C. Rice, "Five Portuguese Etymologies" (*PMLA* 584-585); J. Parker, "A Brazilian Portuguese Word List" (*MLF* 103-114), a useful comparison of a colloquial list with the *Graded Word Book* (Crofts, 1945); C. Stavrou, *Pronunciation of Portuguese in Brazil* (McKay).

FRENCH LITERATURE

General. — W. Giese translated *French Lyrics in English Verse* (Wisconsin). "The Language of the Poet" (*SP* 93-120) of the past helps to explain modern theories of pure poetry, according to H. Hatzfeld; M. Françon gives an interpretation of a similar matter in "Poésie pure et art pour art" (*FR* 14-17).

Early.—A. Adler explained in "*Hervis de Mes* and the Matrilineal Nobility of Champagne" (*RR* 150-161) this practice as of local and not Germanic origin; he also added "A Note on the Amazons in *Anseÿs de Mes*" (*MLN* 451-454). V. Koenig schematicized the wager cycle (*MP* 76-83), particularly as relating to OF examples. By understanding that "The Symbolism of *Perlesvaus*" (*PMLA* 42-83) is a substitution of knights for Biblical characters, this work achieves greater literary stature, according to J. Carman. U. Holmes edited a competent critical third edition of *Adenet le Roi: Berte aus grans pies* (North Carolina). On troubadours: "An Old Provençal *Chanson de mal mariée*" (*RR* 3-19), annotated by K. Lewent, was written by the Catalan Cerveri de Girona; "Lusignan in the Provençal Biographies" (*SP* 1-5), by A. H. Schutz. "The Traditional Background of *Partonopeus de Blois*" (*PMLA* 916-946) was found by H. Newstead in a complex of traditions brought together around the figure of Morgain la Fée. Grace Frank, studying Villon, concluded that he was "incorrigible and impenitent" (*RR* 225-236) and that his adversary in love was Perrenet Marchant (*MLN* 113-115).

Sixteenth Century.—L. Ellis contributed a critical edition of *Estienne Jodelle: Cléopatre Captive* (Pennsylvania) to the history of French tragedy. "The Background and Sources of Remy Belleau's *Pierres précieuses*" (*PMLA* 624-635) were found principally in Pliny and Marbode by U. Holmes. James Buffum studied *L'influence du voyage de Montaigne sur "Les essais"* (Princeton), and H. Kurz cast a negative vote on "Did Montaigne Alter La Boétie's *Contr'un?*" (*SP* 619-627). N. Osborne brought out *Doctor in the French Literature of the Sixteenth Century* (Oxford).

Seventeenth Century. — N. Edelman proved that *Attitudes of Seventeenth-Century France toward the Middle Ages* (Columbia) have not been sufficiently known to show the full contribution of that period. "Segrais and Boileau" (*RR* 162-167), argued W. Sylvester, were separated by personal differences rather than disparate basic views. The inventor of the religious novel in France, "Jean-Pierre Camus" (*PMLA* 711-738) was the subject of a thorough study and bibliography by M. Storer. A tranquil stoic and not a libertine, concludes J. Patrick after "A consideration of *La terre australe connue* by Gabriel de Faigny" (*PMLA* 739-751).

Eighteenth Century. — B. Morrissette disputes as untenable Marcel Langlois' attribution of *La princesse de Clèves* to Fontenelle (*MLN* 267-270). G. R. Havens edited *Jean-Jacques Rousseau: Discours sur les sciences et les arts* for the MLA monograph series. M. Gilman investigated "The Poet According to Diderot" (*RR* 37-54); D. McGhee discussed in "The conte philosophique" (*PMLA* 752-761) a literary type developed and characterized by Marmontel and Mercier. Some 35 works, examined in *Dramatic Parody by Marionettes in Eighteenth-Century Paris* (Columbia) by F. W. Lindsay, show little instructional intent; S. Travers in "Parody in the French Theater" (*RR* 237-243) and in "The Melodrama Satirized in Theatrical Parody" (*MLN* 299-304) reaches the same conclusion.

Nineteenth Century. — Both M. Carter's *Role of the Symbol in French Romantic Poetry* (Catholic) and A. George's "The French Romanticists and the Chain of Being" (*MLQ* 131-144) stress the importance of metaphysical conceptions to writers of the period. Johns Hopkins Press published companion studies: T. C. Walker, *Chateaubriand's Natural Scenery*; C. Lynes, *Chateaubriand as a Critic of French Literature*; and E. Malakis, *Chateaubriand: Itinéraire de Paris à Jerusalem*, a critical edition. The humanitarian appears in H. Hastings' "Man and Beast in Lamartine" (*PMLA* 1109-1125). "The Courtesan in the French Theatre, 1831-80" (*FR* 161-166) is classified as *demi-mondaine, cocotte, grie, prostitute*, by S. Brawn. O. Moore saw a trend toward photographic "Realism in *Les Misérables*" (*PMLA* 211-228) at successive stages of its composition. Three Rimbaud studies appeared, two by New Directions: *Rimbaud* by W. Fowlie; *Prose Poems from the 'Illuminations,'* translated by Louise Varèse. M. Mengers released some unpublished letters (1894-98) by another symbolist poet, Henri de Régnier (*RR* 55-67). The war drew attention to H. Rufener's *Biography of a War Novel, Zola's 'Débâcle'* (King's Crown).

Twentieth Century.—Critical studies were few but interesting. R. Virtanen found that a practitioner of "absolute" scepticism, Remy de Gourmont, did not free himself entirely from dogmatism (*MLQ* 337-355); K. N. Douglas examined the literary attacks made by "Paul Valéry on Pascal" (*PMLA* 820-834); R. Vigneron revealed undeniable departures from plans and principles in Proust's "Structure de *'Swann'*" (*MP* 102-128); A. Fite discussed Georges Duhamel in "Croniqueur moderne and the roman fleuve" (*MLF* 93-99). The sojourn of "Saint Exupéry in New York" (*MLN* 458-463) was described by E. Fay, while J. Fermaud saw in him a conflict between living as poetry and as action (*PMLA* 1201-1210. J. O'Brien revealed much about "Clandestine French Literature during the Occupation" (*MLJ* 440-448), principally the *Editions de Minuit*.

ITALIAN LITERATURE

Dante.—The principal study was G. Walsh's *Dante Alighieri, Citizen of Christendom* (Bruce). D. Vittorini expressed a belief that "Dante's Contribution to Esthetics" (*Ital* 265-274) was a theory of art which freed him from the bonds of the Trivium and Quadrivium. W. Friederich proved that "Dante's fame among the poets and philosophers of Germany, 1800-65" (*PQ* 173-189) was considerable and stimulating. In Boncompagno's *Rhetorica,* H. Wieruszowski found "An Early Anticipation of Dante's *Cieli e scienze*" (*MLN* 217-228). Dante made "Use of Latin in the *Vita nuova*" (*MLN* 108-112) to indicate oracular as contrasted with ordinary utterance. Textual clarifications appeared in *Italica* (73-81, 88-89, 136-141).

Michelangelo, Croce, and Others.—A. H. Gilbert supported "Machiavelli on Fire Arms" (*Ital* 275-286). In "Michelangelo and the Doctrine of Imitation" (*Ital* 90-99), R. Clements stated that the artist's preoccupations were typical of the day but his individualism led him to emulate and surpass his models. "Some Pictorial Aspects of Early Mountebank Stages" (*PMLA* 84-96) were reviewed by J. McDowell. H. Marraro made interesting comments on "Italian Music and Actors in America" (*Ital* 103-117). J. De Simone in *Alessandro Manzoni: Esthetics and Literary Criticism* (Vanni) may be thanked for bringing together scattered data on Manzoni as a literary critic. Literary critics and criticism were also the subjects of papers by G. Borgese, "Literary Criticism in Italy During the Romantic Period" (*Ital* 65-72), down to Croce; N. Orsini, "Bernadetto Croce during the War Years" (*Ital* 1-3), seeing no change in his philosophical liberalism; and W. Giuliano, "Spiritual Evolution of Giovanni Papini" (*Ital* 304-311).

SPANISH LITERATURE

Early.—George Umphrey published Part 2, on verse technique, of "Spanish Ballads in English" (*MLQ* 21-33). "The Phonology of Speech of the Negroes in Early Spanish Drama" (*HR* 322-339), by E. de Chasca, included sound elements of popular, Portuguese, and African origin. The poet "Ruy Páez de Ribera" (*HR* 22-37) was again the subject of biographical research by E. B. Place. S. Gilman investigated the composition-time element in the *Celestina* (*RFH* 147-159). M. Lida indicated that the popularity of "Fray Antonio de Guevara" (*RFH* 346-388) was caused by a widespread decline in literary taste. The second volume of *Torres Naharro: Propalladia and Other Works* (Bryn Mawr), edited by J. E. Gillet, appeared.

Golden Age.—E. B. Knowles added "Notes on the Madrid, 1605, Editions of *Don Quijote*" (*HR* 47-58), and S. Gilman, after reviewing the many articles dealing with "Alonso Fernández de Avellaneda" (*HR* 304-321), concluded he was a Dominican friar from Aragon. The renewed interest of our age in mysticism accounts for "The Revival of Saint John of the Cross" (*MLQ* 145-152) argued S. C. Rosenbaum. E. W. Hesse compared "Two Versions of Calderon's *El laurel de Apolo*" (*HR* 213-234).

Modern.—In an article "On Espronceda's Personality" (*PMLA* 1126-1145), W. T. Pattison reasoned that this poet's Byronic traits were more a pose than a reality. J. Leslie gave the full text of "Larra's Unpublished Anacreontic" (*MLN* 345-349). S. Eoff expressed his belief that "Pereda's Conception of Realism" (*HR* 281-303) was vigorous but held in check by his artistic decorum. Other articles: E. S. Morby, "García Lorca in Sweden" (*HR* 38-46), most popular Spanish writer in that country; R. Predmore. "La visión de Castilla en la Obra de Antonio Machado" (*Hisp* 500-506); J. Van Horne, "Literary Letter from Madrid" (*Hisp* 206-213), covering two years of residence; H. Weyl, translator, *José Ortega y Gasset: Concord and Liberty—Essays* (Norton).

SPANISH AMERICAN LITERATURE

Several important volumes appeared during 1946. E. H. Hespelt and others edited the best one-volume *Anthology of Spanish American Literature* (Crofts) yet to appear. The late Pedro Henríquez Ureña's *Literary Currents in Hispanic America* (Harvard) shows that critic's usual acumen. W. R. Crawford gave to the press *A Century of Latin-American Thought* (Harvard), and A. Torres-Ríoseco revised his popular *Epic of Latin American Literature* (Oxford), including a chapter on Brazilian literature.

Studies in the field of poetry included O. Olivera Ibarra, "La poesía del 'Papel periódico de la Havana' (*RI* 259-272); J. Mallo, "Rubén Darío en Barcelona durante su último viaje a España" (*RHM* 37-47); R. Stanton, "Salvador Díaz Mirón, el poeta" (*MLF* 50-57); D. Walsh, "César Tiempo" (*Hisp* 197-205, *cf. RI* of 1945, 99-106), a naturalized Jewish poet writing in Argentina; M. Arce, "La poesía de Juan Guzmán Cruchaga" (*RI* 341-344), a contemporary Chilean poet; A. Campa, *Spanish folk poetry in New Mexico* (New Mexico); Muna Lee, *Jorge de Carrera Andrade: Secret country* (Macmillan), a translation accompanied with the original Spanish selected poems of this Ecuadorian poet.

Four articles dealt with statesmen-writers: J. Leslie, "Problems Relating to Sarmiento's *Artículos*" (*MLN* 289-299), materials wrongly included or omitted from his *Obras;* M. P. González, "Cuba's Fernando Ortiz" (*BA* 9-13), a view of his writings; A. Vargas Barón, "José Joaquín Vargas Valdés" (*RI* 239-257), a nineteenth century Columbian; S. Nemtzow presented the Ecuadorian critic of the clergy Montalvo as essentially true to Catholic religious morality (*RI* 243-267).

A Venezuelan novelist "Manuel Díaz Rodríguez" (*RI* 49-54) was presented as a victim of moral indecision by L. Munguió; J. R. Spell proved Guridi y Alcocer was the author of a satirical description in Lizardi's *Quixotita* (*HAHR* 405-408); H. L. Johnson's "El primer siglo del teatro en Puebla de los Angeles" (*RI* 295-340) is the best account available, very well documented.

PORTUGUESE AND BRAZILIAN LITERATURE

J. D. M. Ford's long-awaited edition of *Luis de Camões: Os lusíadas* (Harvard) has not escaped criticism. "The authenticity of de Hollanda's *Dialogos em Roma*" (*PMLA* 1018-1028) is substantiated by internal evidence, R. Clements reported. Some Brazilian studies are: L. L. Barrett, "Erico Veríssimo and the Creation of Novelistic Character" (*Hisp* 323-338), showed the fictional world as closely reflecting the factual world; E. R. Moore recorded folk rituals in "Three Brazilian Nights of Magic" (*Hisp* 67-68) and "Os dias joaninos" (*RI* 109-111).

COMPARATIVE LITERATURE

Italian influence on Spanish and English writers was seen by many scholars. F. Pierce discussed "Some Themes and Their Sources in the Heroic Poem of the Golden Age" (*HR* 95-103) and indicated the influence of Tasso and Boiardo in Spanish epic poems; J. C. Fucilla found "A Passage in Quevedo's *Buscón* (*Ital* 102) borrowed from Berni and he also illustrated "The Influence of Ercilla and Tasso on Escóiquiz" (*HR* 68-75); B. Hall discovered "A Further Tasso Imitation in Francisco de Medrano" (*HR* 65-66). J. Draper's "Shakespeare and the *conversazione*" (*Ital* 7-17) sought to show that this parlor game of formal courtly discussion was used in appropriate plays throughout his career; J. Van Horne contrasted the cult of pain with faith in the common man in "Leopardi y Whitman" (*Ital* 161-169); F. Townsend in "Sydney and Ariosto" (*PMLA* 97-108) discussed the structural elements the former learned to employ from the latter.

Several careful studies explored French influences and borrowings. T. Russell found bonds between *Voltaire, Dryden, and Heroic Tragedy* (Columbia); M. Fayer, between *Gide, Freedom and Dostoevski* (Columbia), especially in the latter's conception of Christianity; C. Beall, between "John Eliot's *Ortho-epia galica* and Du Bartas-Goulart" (*SP* 164-175). P. Wadsworth traced antithetical use of realism and idealism as "A Formula of Literary Criticism from Aristotle to La Bruzère" (*MLQ* 35-42). "An Analogue of L'Ermite in *Zadig*" (*MLN* 115-118) of Voltaire can be found in ancient Hebrew legends of Asmodeus, according to H. Loss. W. Vordtriede examined "Novalis' *Heinrich von Ofterdingen* as a source for Baudelaire" (*MLF* 100-102).

Spanish writers were also debtors or creditors in literary currency. W. Smith said that almost certainly Montaigne had borrowed from Vives (*Hisp* 483-493), a fellow educator; W. Perry discussed Nathan Field's indebtedness to Cervantes in "The Curious Impertinent in *Amends for Ladies*" (*HR* 344-353); and E. Morby elucidated the many bonds of interest between "William Dean Howells and Spain" (*HR* 187-212). A. Krappe traced shepherd and king in *El libro de exemplos* through Persia to India (*HR* 59-64); H. Holmes referred to Walter Owen's translation of Estanislao del Campo's *Fausto* in "Una interpretación pampeana de Goethe y Gounod" (*RI* 229-241); R. Niess sought and found Federico Gamboa's indebtedness in *Reconquista* to Zola's *L'Oeuvre* (*PMLA* 577-583); S. Rosenbaum indicated the direct influence of the French poet Albert Samain on Delmira Agustini (*RI* 273-277).

LATIN LITERATURE *

By GEORGE DEPUE HADZSITS
PROFESSOR, UNIVERSITY OF PENNSYLVANIA

PLACE OF THE CLASSICS IN EDUCATION

Sir Richard Livingstone adds to his reputation as one of the leading thinkers on the subject of the place of the Classics in Education, in his illuminating essay "Education for the

---

* Periodicals are abbreviated as follows: *AHR*, *American Historical Rev.*; *AJA*, *American Journal of Archaeology*; *AJP*, *American Journal of Philology*; *CB*, *Classical Bulletin*; *CJ*, *Classical Journal*; *CO*, *Classical Outlook*; *CP*, *Classical Philology*; *CQ*, *Classical Quarterly*; *CR*, *Classical Rev.*; *CW*, *Classical Weekly*; *HSCP*, *Harvard Studies in Classical Philology*; *HThR*, *Harvard Theological Rev.*; *Is.*, *Isis*; *JHI*, *Journal of History of Ideas*; *JRS*, *Journal of Roman Studies*; *Lang.*, *Language*; *PhQ*, *Philological Quarterly*; *Spec.*, *Speculum*; *PAPA*, *Proceedings of the American Philological Association*; *TAPA*, *Transactions* of the same; *Verg.*, *Vergilius*; *YCS*, *Yale Classical Studies* (all references are to 1946).

Biographical information will be found in lists of "Recent Publications," appearing in *CW*, and in "Recent Books," listed in *CJ*, as well as under "Classical Articles in Non-Classical Periodicals" which *CJ* also publishes.

Modern World" (*Atlantic Monthly*, Nov. 1946, 75-79). Compare also his recent *Plato and Modern Education* (Cambridge Univ. Press), which pleads for a more spiritual conception of education.

As predicted in the 1945 issue of THE AMERICAN YEAR BOOK (p. 963), the Harvard Report on *General Education in a Free Society* is exerting a wide influence. A valuable report on its effect on Latin Studies appears in the *CW* (40, 18-23). The Harvard Report has been followed by others, *e.g.*, Yale, Indiana, Amherst, Washington University, North Carolina; in all of these, solution of the problem is sought—what place the Classics should occupy in our American postwar collegiate education.

Particularly noteworthy is the penetrating study of Waldo G. Leland, entitled "The Present Task of the Humanities" (*School and Society*, 64, 281-284), which points out the imperative need of scholarship that it should be "an act of social faith" in order to assist in the cure of the ills of men's minds.

The editor of the *Classical Journal*, N. J. DeWitt, calls attention to the Report of the Committee of the American Bar Association which recommends the study of Latin in Pre-Legal Education (*CJ* 41, 212). John Murray, London, printed a brochure. A Symposium, entitled *The Classics and Education for the Professions* (see H. C. Lipscomb's rev., "Latin and the Professions in England," in *CJ* 41, 358-359). Compare also George W. Currie, *Essentials of General and Scientific Latin* (Boston, Chapman and Grimes).

Professor W. C. Korfmacher touches on a very important point in his conception of the place of Latin in our Education: "Latin and the New Internationalism" (*CW* 39, 122-124), and C. T. Murphy discusses an important experiment, at Princeton, a cooperative course in the Humanities, which develops the great idea of "The Western Tradition: Man and His Freedom" (*CW* 39, 130-133).

"Successful Writing and Foreign Language Study" is a Symposium on the Question whether Foreign Languages Improve Your Own—with the answer in the affirmative, given by an impressive number of distinguished men of letters (*CJ* 42, 23 seq.).

Articles on the *Values* of the Classics continue to appear. Notable among these have been: "English Teaching and the Classics," by A. G. Keller (*School and Society* 62, 49-51, critical, but important for that very reason). "On Classics in Education," H. B. Joffee, is valuable for the bibliography that accompanies the text (*CJ* 41, 213-218).

Special attention deserves to be called to the new plan of the Cincinnati Classical Scholarships (*CJ* 42, 8), which have been inaugurated in order to promote the cause of classical education in a community of unusual enlightenment.

One more rousing appeal: "Classics, Pure and Applied," by D. G. Taylor (*Greece and Rome*, 15, 33-41). *Credo for a Classicist* is a brief, but telling statement of the "Case," by G. F. Else, which should be in the hands of all "Educators" (U. of Iowa). "Latin and Greek in French Canada" (*CJ* 41, 320-322), Maurice Lobel, is enlightening.

LITERATURE AND LINGUISTICS

"Versificator Quam Poeta Melior" is the title of a stimulating study, by W. H. Alexander (*CJ* 41, 219), on Cicero's claim to poetic inspiration, but the truth of Alexander's argument is questioned in a spirited reply by J. W. Spaeth (*CJ* 42, 105).

"Julius Caesar as a Man of Letters," by C. C. Mierow, should be widely read. It reviews the opinions of Hirtius, Pollio, Cicero, Tacitus, and Suetonius, and gives an admirable statement of Caesar's literary gifts (*CJ* 41, 353-357).

"Horace and the Elegists" reveals with great acumen, Horace's opposition to the Alexandrinism and anti-Augustanism of the Elegiac school in Rome. The latter—the instrument of the gay set of the Capitol—was inevitably opposed by Horace, and Prof. Brooks Otis throws fresh light on a most interesting, ancient literary quarrel (*TAPA* 76, 177-190).

L. P. Wilkinson, *Horace and His Lyric Poetry* (Macmillan), receives high praise from Clarence Mendell (*CW* 39, 86, see, also, the review, *AJP* 67, 280-283).

Elizabeth H. Haight writes well on "The Lyre and the Whetstone, *Horatius Redivivus*" (*CP* 41, 135-142). Miss Haight defends Horace, as thinker, against some recent criticism, and seeks the secret of his persistent *generative* force in the world's literature. Grant Showerman's *Horace and His Influence* should not be forgotten.

H. L. Tracy asserts that Vergil was not wholly successful in his compounding of epic and tragic material in *"Aeneid IV,* Tragedy or Melodrama" (*CJ* 41, 199-202).

Severely critical is the study of R. P. Oliver, "The First Edition of the *Amores*" (*TAPA* 76, 191-215), in which the distinguished scholar seeks to establish the thesis that the present text of Ovid's *Amores* represents extensive revisions in subject and style, of a date as late as 2 *A.D.*, in consequence of which, conclusions regarding Ovid's early style or character can not be drawn from our text.

"Seneca's Tragedies—A New Interpretation" is the title of a remarkably penetrating investigation of Seneca's aim in tragic composition, which is represented as teaching Neo-Stoicism and its attitude toward problems of life, the emotions, sin, retribution, death, and destiny. Berthe Marti analyzes Seneca's literary achievement in the light of that aim (*TAPA* 76, 216-245).

Karl Lehmann writes, interestingly, on "A Roman Poet Visits A Museum," a learned commentary on a passage in Martial which argues for the belief that Martial is referring to a definite art collection in Rome (*Hesperia* 14, 259-269).

E. G. Berry writes most interestingly on the remarkable volume *Holmes–Pollock Letters* (Correspondence of Justice Holmes and Sir Frederick Pollock), published by the Harvard University Press. This article calls attention to the remarkable knowledge these cultivated gentlemen had of the Classics (*CW* 39, 22-24) and works about the Classics.

Pearl Kibre writes a very valuable article on "The Intellectual Interests Reflected in Libraries of the 14th and 15th Centuries" (*JHI* 7, 257-297).

Attention should again be called to the excellent *Handbook of Classical Drama* of P. W. Harsh, which is reviewed by J. N. Hough (*CJ* 41, 181-183).

The Catholic University of America Press continues publication of its notable series of Classical Studies, among which the following may be noted here: *The Syntax of the Letters of Pope Gelasius I,* P. V. Bagan (*AJP* 67, 278-280).

Prof. J. Whatmough investigates the "Dialects of Ancient Gaul" (*HSCP* 55, 1-85), with his well-known, scholarly acumen (*CW* 39, 16 and 40, 6).

W. H. Kirk continues his valuable studies of "The Syntax of the Gerund and the Gerundive, II" (*TAPA* 76, 166-176).

RELIGION AND PHILOSOPHY

"Livia and the Roman Imperial Cult" is treated ably by Gertrude Grether, who has elaborated on a topic in the history of Roman Religion that richly deserved this careful study (*AJP* 67, 222-252).

A fascinating article of Harold Mattingly (*HThR* 39, 212-215) on "The Religious Background of the *Historia Augusta,*" argues for the belief that the *Historia* belongs to a period between two tides, *i.e.*, of the entry of Christianity into imperial favor and its transition to persecution and intolerance (*ca. A.D.* 312-390).

"Pagan Divine Service in Late Antiquity" calls attention to the many similarities between pagan and Christian divine services. The author of this stimulating study is M. P. Nilsson (*HThR* 38, 63-69; cf. *CW* 39, 48).

J. Dwight re-opens the question of "The Origin of the Pre-Julian Calendar (*CJ* 41, 273-275).

Caesar and Christ is the title of

another brilliant exposition of pagan and Christian life by Will Durant (*CJ* 41, 349-350). Walter W. Hyde's volume, *Paganism to Christianity in the Roman Empire,* has been issued by the University of Pennsylvania Press.

"Remotum a Notitia Vulgari" is the forbidding title of an article of first-rate importance prepared by Susan Savage (*TAPA* 76, 157-165). It is concerned with secret practices of Roman religious colleges. These secrets were of such sanctity that the very existence, as well as efficacy, of Roman cults was thought to depend upon them.

"A New and Broader Interpretation of the Ideality of Aeneas" is an illuminating study of an old problem of first consequence in the history of Ethics. John N. Hritzu has added to our knowledge of the subject. (*CW* 39, 98-103, 106-110).

Marcus Aurelius' Meditations have a perennial appeal as is demonstrated by the new text, translation, and commentary, prepared by A. S. L. Farquharson for the Oxford University Press (*CJ* 42, 96-97).

"The Moral Basis of *Hospitium Privatum*" is significant for its emphasis upon the ethical-religious content of the ancient concept of hospitality; friendship, faith, protection of Zeus are involved (*CJ* 41, 248-253, O. E. Nybakken).

All classical scholars should note "Leibniz's Message to Us" which occupies an entire number of the *JHI* (7, 385 seq.), as the ancient materialism can best be understood by comparison with such later thinkers, as Leibniz.

Clyde Murley gives an extremely interesting account of "Behavior Patterns of Atoms, among the Ancients" (*CO* 23, 71-72) and examines the importance of the "Dance of the Atoms."

W. H. Stahl examines, with great care, possible reasons for the Greek abandonment of the heliocentric theory, and explains the true relations of Copernicus to the brilliant theorizing of Aristarchus; "The Greek Heliocentric Theory and Its Abandonment" (*TAPA* 76, 321-332).

Glanville Downey contributes a brilliant exposition of his theme, "The Pagan Virtue of *Megalopsychia* in Byzantine Syria." This is a study of the concept as revealed in two mosaics at Antioch-on-the-Orontes, and Dr. Downey suggests that this virtue came to be regarded as a principal pagan virtue, acceptable to and accepted by Christian emperors (*TAPA* 76, 279-286) as an official imperial virtue.

Prof. N. W. DeWitt adds to his reputation as a profound scholar in ancient philosophy by his invaluable essay on "Epicureanism and Christianity" (Univ. of Toronto *Quarterly,* 14.3, 250-255) and by another genuine contribution: "Roman Epicureanism," which is concerned with the influence of Epicureanism in ancient Italy for four centuries (*Transactions of the Royal Society of Canada,* 39, 31-44).

HISTORY, LAW, AND POLITICS

Eva Matthews Sanford writes well on the important theme of "The *Pax Romana* and World Trade" (*CO* 23, 77-78).

Lillian B. Lawler introduces us to an "idol of the Roman Empire," in her "Portrait of a Dancer," which has sociological-historical interest (*CJ* 41, 241-247).

"Roman Revenues from Greece after 146 *B.C.*," are discussed by H. Hill (*CP* 41, 35-42), concluding that Rome's policy was lenient.

"Swimmers in Warfare" should interest a wide audience. This article refers to ancient and modern practices and, properly, calls attention to Julius Caesar's skill (*CW* 39, 34-35, H. N. Couch). Likewise, the article of H. E. Wedeck dwells on practices, both ancient and modern, in his "Ancient Spies" (*CW* 39, 31-32), and J. N. Hritzu writes on "Modern Military Aspects of Hannibal's Crossing the Rhone" (*CO* 23, 72-73).

Equally significant for the present day is F. H. Cramer's "Book-Burning and Censorship in Ancient Rome—A Chapter from the History of Freedom of Speech" (*JHI* 6, 157-196; *CW* 39, 48).

Dr. E. S. McCartney writes entertainingly on "Looking Back at the War News" (*CJ* 41, 168-172), giving Roman parallels, with which he is exceptionally familiar. Compare, also, his exciting "Spider versus Snake" (*CW* 39, 133-134), and "An Illuminating Example of Homeopathic Magic" (*CW* 39, 21-22), offering a Chinese parallel to a famous Greek story.

W. C. Korfmacher's "The Gentleman as the Romans Knew Him," (*CW* 39, 138-141) discusses an important subject that deserves full treatment in a series of monographs.

"Epigraphical Evidence for Social Charity in the Roman West," M. P. P. McGuire (*AJP* 67, 129-150), will interest many.

The Classical Republicans. An Essay on the Recovery of a Pattern of Thought in Seventeenth Century England, by Z. S. Fink (Northwestern Univ. Press), is highly praised by H. C. Lipscomb (*CW* 40, 31-32), as significant and timely, and as contributing to our knowledge of the value of the theory of "mixed" form of government, advocated by Polybius, Cicero, and Plutarch.

Prof. L. R. Taylor argues for a new "Date of the Capitoline *Fasti,*" which are housed in the Palazzo dei Conservatori in Rome. In arguing for her new date (*ca.* 21-17 *B.C.*), Professor Taylor has the courage to cross swords with older scholars of great reputation, and, in doing so, enhances her own standing for critical scholarship (*CP* 41, 1-11).

"Law and Justice in the Ancient World" (*JHI* 7, 298-320), by A. H. Chrousk, associates Roman law with Stoicism and argues that law, in the modern sense, began in Rome, while a philosophy of law originated in Greece.

F. De Zulueta's *The Roman Law of Sale* (Oxford Classical Press) receives high praise (*Cl. Rev.* 60, 45-46).

Henry Montgomery's "The Architect of the American Republic" is another excellent study of Thomas Jefferson's reasoned and justified predilection for the Classical orders of architecture (*CW* 39, 74-78).

FINALIA

Worthy of longer notice are the following titles which are, however, self-explanatory: R. E. Arnold (Ed.), *Classical Essays Presented to James A. Kleist* (St. Louis Univ. Press); F. S. Boas, *Aspects of Classical Legend and History in Shakespeare* (N. Y., Oxford Univ. Press); C. M. Bowra, *A Classical Education* (Oxford Univ. Press) and *From Virgil to Milton* (Macmillan); A. T. Geoghegan, *The Attitude towards Labor in Early Christianity and Ancient Culture* (Catholic Univ. of America Press, *CP* 41, 181-183); Phillip DeLacy: "The Stoic Categories as Methodological Principles" (*TAPA* 76, 246-263); R. S. Rogers: "Domitius Afer's Defense of Cloatilla" (*TAPA* 76, 264-270); Robert O. Fink, "A Fragment of a Roman Military Papyrus at Princeton" (*TAPA* 76, 271-278); Elizabeth C. Evans: "Galen the Physician as Physiognomist" representing a relatively new field (*TAPA* 76, 287-298); I. E. Drabkin: "Notes on the Text of Caelius Aurelianus" (*TAPA* 76, 299-320); T. R. Glover, *The Ancient World* (London, Penguin Books); Buxton, C. R., *Prophets of Heaven and Hell—Vergil, Dante, Milton, Goethe* (Cambridge Univ. Press); F. Copleston, *A History of Philosophy: Greece and Rome* (London, Burns Oates); R. C. Trevelyan's verse translation of *Virgil, Eclogues and Georgics* (Macmillan; *CP* 41, 59-60).

"Ancient Rome Brought to Life," by Rhys Carpenter, and "The Roman Way," by Edith Hamilton, in *The National Geographic Magazine* (Nov. 1946) are extremely interesting, textually and pictorially magnificent.

CLASSICAL JOURNALS

Mention should be made of the new Classical journals that are venturing upon a career, in the midst of the Classical depression: *La Parole,* Journal of the Linguistic Circle of New York, and *Traditio: Studies in*

Ancient and Medieval History, Thought, and Religion (*AJP* 67, 365-369).

FOREIGN BOOKS

Books are now being received in this country which had appeared abroad during wartime in spite of the devastation of war, and they bear witness to the heroism of authors. Classicists will hail *Bibliographie de la littérature latine* (Paris, "Les Belles Lettres"), an invaluable bibliographic manual. We are gradually learning of the extraordinary activity of Classical scholars abroad throughout the enormous difficulties of war; (*CW* 40, 15-16, B. L. Ullman *et al.*). To the titles there listed should be added: *Cicero u. der Humanismus,* Walter Ruegg (Rhein-Verlag, Zurich).

TRIBUTE TO E. K. RAND

A noble tribute, composed in Latin, to the memory of the lamented E. K. Rand, appears in the *CJ* (41, 266-269) entitled "Laudatio Funebris." The Marquette Univ. Press has released Professor Rand's *Cicero in the Court Room of St. Thomas Aquinas,* the last volume of this brilliant and prolific scholar.

GREEK LITERATURE *

By Royal Case Nemiah
Professor, Dartmouth College

GENERAL

There are various evidences of renewed vitality in the field of Greek scholarship. The publication during 1946 of one revised edition of an elementary Greek book and one entirely new one is clear proof that Americans want to know something about Greek first-hand and will not be contented with second-hand knowledge derived from translations and critical commentaries. A reading of this article, showing the multiplicity of the areas of human endeavor that have their roots in Greek civilization, will constitute but another proof of the value of Greek studies, if our civilization is to have depth as well as breadth. With the release of so many scholars from government service and the gradual return of the world to peacetime conditions, one may look forward with enthusiasm and excitement to new discoveries, particularly in the field of archaeology, which will throw new light on ancient Greek culture, an integral part of our own occidental culture.

THE GREEK LANGUAGE

A welcome sign of continued and, it is to be hoped, increased interest in the Greek language is the appearance of a new edition of *A New Introduction to Greek* by A. H. Chase and H. Phillips, Jr. (Harvard Univ. Press). Still another book at the elementary level is *A Reading Course in Homeric Greek* by R. V. Schoder and V. C. Horrigan (Edwards Bros., Inc., Ann Arbor, Mich., 1945). In the field of New Testament Greek should be mentioned *A Comparative Lexicon of New Testament Greek* by L. R. Eliott (Central Seminary Press, Kansas City, 1945). Of interest to specialists in the field of Greek is *A Reverse Index of Greek Nouns and Adjectives* by C. D. Buck and W. Petersen (Chicago Univ. Press, 1945), in which the words are arranged according to terminations. Also by Buck is "The Dialect of Cyrene" (*CP,* 41, 129), using new evidence from Italian excavations to show the similarity of this dialect to that of its mother city, Thera. M. J. Higgins is the author of an important article entitled "The Renaissance of the First Century and the Origin of Standard Late Greek" (*Traditio,* 3, 49).

* Abbreviations: *AJA*, *American Journal of Archaeology; AJP*, *American Journal of Philology; BMFA*, *Bulletin of the Museum of Fine Arts* (Boston); *BMMA*, *Bulletin of the Metropolitan Museum of Art* (New York); *BPIASA*, *Bulletin of the Polish Institute of Arts and Sciences in America; CJ*, *Classical Journal; CP*, *Classical Philology; CW*, *Classical Weekly; HTR*, *Harvard Theological Review; PAPA*, *Proceedings of the American Philological Association; TAPA*, *Transactions of the American Philological Association; UCPCP*, *University of California Publications in Classical Philology*. Titles of books, monographs, and periodicals are italicized; those of articles are in quotation marks.

HOMER

The Sather Classical Lectures this year (vol. 20) dealt with Homer in R. Carpenter's *Folk Tale, Fiction and Saga in the Homeric Epics* (Univ. of Cal. Press). G. M. Bolling continues his Homeric studies with "Wackernagel's Psilotic Homer" (*CP,* 41, 232), a defense of Wackernagel's theory; "The Etymology of Ichor" (*Language,* 21, 49); "An Emendation in Homer's Iliad, 21, 396-398" (*Ibid.* 21, 92); and "Dative Plural of the 'a' and 'o' Stems in Homer" (*Ibid.* 21, 261). A. S. Cooley, in "Where Was Homer's Pylos?" (*CJ,* 41, 310), believes with Strabo and Doerpfeld that it was the modern Kakovatos rather than Ano Englianos, as held by Kourouniotis and Blegan. F. M. Combellack in "Achilles—Bare of Foot?" (*CJ,* 41, 193) investigates the problem of when and where the Homeric heroes wore shoes. A. P. Dorjahn writes of the courtesy and liberalism of Homeric heroes toward their enemies in "Homeric Foemen" (*CW,* 40, 2). Two similar articles on the value of Homer for our contemporary world are G. M. Howland's "Some Observations on the Iliad" (*CW,* 39, 13) and P. A. Sullivan's "Rereading the Iliad" (*Ibid.* 39, 18).

LYRIC AND DRAMATIC POETRY

In the field of the lyric is to be mentioned *Poems of Alcman, Sappho, and Ibycus* in an English version by O. Marx and E. Morwitz (Knopf, 1945). Pindar receives attention in the interpretation of *Olympian,* 9, 100-112 by R. Lattimore (*CP,* 41, 230); *Pythian,* 2, 52-56 by E. Wyckoff (*CP,* 41, 160); and the Epilogue of his *Second Pythian* by L. Woodbury, who shows Pindar's contempt for rivals and enemies and his profound aristocratic spirit (*TAPA,* 76, 11).

Contemporary interest in Greek tragedy and comedy is seen in the performance in New York of Lewis Galantière's adaptation of Jean Anouilh's version of the *Antigone* of Sophocles with Katharine Cornell and Sir Cedric Hardwicke; of W. B. Yeats' translation of Sophocles *Oedipus the King* with Laurence Olivier and a cast from the "Old Vic"; and of a somewhat abortive revival of Aristophanes' *Lysistrata* with a Negro cast. Interest is further indicated by the publication of *Plays of the Greek Dramatists,* containing representative plays in standard translations of Aeschylus, Sophocles, Euripides, and Aristophanes (Caxton House). There is an excellent article by H. J. Rose entitled "Theology and Mythology in Aeschylus" (*HTR,* 39, 1).

L. A. Post makes an interesting suggestion in "Propaganda for Pericles in the Seven Against Thebes" (*PAPA,* 76, xxvii), showing that, although Eteocles had been cursed by Oedipus and Pericles was cursed as an Alcmaeonid, even persons under a curse could be patriotic citizens. This, says Post, was propaganda for Pericles, who had been *choregus* for Aeschylus' Persians in 472 *B. C.* P. C. Wilson (*Ibid.* 76, xxxix) in "Athena's Persuasion (Aesch. Eumen. 797-916)" says that the change of the Erinyes from violent enemies to willing listeners is owing to the fact that they are persuaded by Athena's repeated and clear presentation of the good. It is a triumph of intelligence over passion. In "Ho Philomeros Sophokles and Eustathius," H. W. Miller shows the value of Eustathius' work on Homeric criticism in the study of the text of Sophocles and its interpretation (*CP,* 41, 99). For those who like this sort of thing there is "Studs Lonigan and Oedipus" by H. Toliver (*CJ,* 41, 145). In "The Third Stasimon of Euripides' *Helena,*" C. P. Golann maintains that this stasimon, usually considered irrelevant, is an integral part of the play. It fits the

Stesichorean version of the myth on which the play is based as well as the divine role of Helen which Euripides had in mind when he wrote the play (*TAPA,* 76, 31). Robinson Jeffers' *Medea* should be mentioned in connection with Euripides (Random House).

M. Platnauer (*AJP,* 67, 262) offers emendations of Aristophanes' *Knights* (1061-2), *Birds* (265-6; 492), and *Frogs* (1106-7). In "Aristophanes and Medical Language" (*TAPA,* 76, 74), H. W. Miller shows the large number of medical terms in the plays, some of them used literally, but most of them metaphorically for humorous reasons. From the hand of that veteran translator, Sir Gilbert Murray, come two versions: *Menander: The Rape of the Lock* and *The Arbitrators* (Oxford Univ. Press). P. W. Harsh in "Hamartia Again" (*TAPA,* 76, 47) holds that Aristotle's *Poetics* (1453a), viewed in the light of the practice of Greek tragic poets, in that of Plato's interpretation of Greek tragedy, and of Aristotle's theories elsewhere expressed, indicates that *hamartia* in the above passage includes the notion of culpability.

G. F. Else in "The Case of the Third Actor" (*TAPA,* 76, 1) shows that in early tragedy the poet was the first actor and was called *tragoedos.* The second and third actors were called *hypokritai,* both being introduced by Aeschylus. When, with Sophocles, the poet was no longer actor, the term *hypocrites* was generalized; but the old terminology was revived in the fourth century for old plays.

MISCELLANEOUS AUTHORS

C. M. Dawson in "An Alexandrian Prototype of Marathus?" (*AJP,* 67, 1) gives a translation, textual and literary criticism of the third of a series of poems known as the *Iambi* of Callimachus from the Oxyr. Papyri. He suggests a prototype of Tibullus I, 4. G. Vlastos, in his article "On the Prehistory in Diodorus," supports the thesis that, in Diodorus I, 8, the historian represents broadly a Democritean point of view (*AJP,* 67, 51).

The only addition to the Loeb Classical Library (Harvard Univ. Press, 1945) since the writing of the article on Greek Literature for THE AMERICAN YEAR BOOK, 1945, is Vol. V (Books 13-19) of the *Roman Antiquities* of Dionysius of Halicarnassus, translated by E. Cary. In "The 'Volitilization' of Peregrinus Proteus" (of whom Lucian wrote), R. Pack (*AJP,* 67, 334) shows that Peregrinus and his followers were influenced by contemporary speculation on the ascent of the soul. In "Pausanias and the Pentelic Quarries," J. Day discusses Pausanias I, 19, 16 (*CP,* 41, 162).

In the field of New Testament scholarship, E. J. Goodspeed writes on *Problems of New Testament Translation* (Chicago Univ. Press, 1945), and at the same press has appeared (1946) *New Testament Life and Literature* by D. W. Riddle and H. H. Hutson.

LITERARY STUDIES

These studies comprise a variety of subjects. *The New England Quarterly* (18, 325) contains an article by S. G. Brown on "Emerson's Platonism." J. P. Pritchard discusses the influence of Longinus on Lowell in his "Lowell and Longinus" (*TAPA,* 76, 358), and B. Einarson is the author of *Longinus, "On the Sublime" and Sir Joshua Reynolds, "Discourses on Art"* (Packard, Chicago, 1945). J. E. Tobin writes on "Alexander Pope and Classical Tradition" (*BPIASA,* 3, 343), and E. S. LeComte on *Endymion in England, the Literary History of a Greek Myth* (King's Crown Press, 1944). I. Silver contributed an excellent article in four parts to *The Modern Language Quarterly* (Vol. 60, pp. 66, 356, 670, 949) on "Du Bellay and Hellenic Poetry."

D. M. Robinson, in "The Wheel of Fortune" (*CP,* 41, 207), shows that the idea of the wheel of fortune, usually thought of as Roman in origin, was really Greek. M. C. Nahm's *Aesthetic Experience and Its Presuppositions* (Harper), though a comprehensive book on the whole field, devotes much space to a discussion of Plato and Aristotle. "The Mediaeval

Accessus ad Auctores" (*Traditio*, 3, 215), by E. A. Quain, is an interesting treatise on the custom of mediaeval commentators to preface the works of an author with remarks on his life, work, philosophical purposes, and trends. It was found in works on grammar, rhetoric, dialectic, canon and civil law, theology, philosophy, and even in creative literature. It was common to both Greek and Latin authors.

PHILOSOPHY

The interest in Greek philosophy is very gratifying at a time when the world's great need is ideas leading toward a more spiritual way of life. Naturally, Plato and Aristotle receive the greatest amount of attention, but good work is also being done in the other fields. K. von Fritz continues his "Nous, Noein and Their Derivatives in Pre-Socratic Philosophy (excluding Anaxagoras). (Cf. THE AMERICAN YEAR BOOK, 1945, 970.) Part II. The Post-Parmenidean Period (Melissus, Zeno, Empedocles, Protagoras, the Atomists)" (*CP*, 41, 12). This should be underlined as a work of considerable importance.

K. Burke contributes "The Socratic Transcendence" to the *Sewanee Review* (53, 630). A very good introduction to the study of Plato is A. Koysé's *Discovering Plato* (Columbia Univ. Press, 1945), translated by L. C. Rosenfield from the original *Introduction à la Lecture de Platon* (Brentano's, 1945). In "The Role of Eryximachus in Plato's *Symposium*" (*TAPA*, 76, 85), L. Edelstein points out that the representation of Edelstein is not a caricature of the physician but that he plays an important role in the framework of the dialogue. An important addition to Platonic studies is R. Hackforth's *Plato's Examination of Pleasure*, a translation of the *Philebus* with introduction and commentary (Macmillan, 1945). R. G. Hoerber has an article on "Character Portrayal in Plato's Lysis" (*CJ*, 41, 271).

Important in the history of Platonic criticism is S. R. Jayne's *Marsilio Ficino's Commentary on Plato's Symposium*, with introduction, text and translation from the Latin (Univ. of Missouri Press, 1944). Another study in the tradition of Plato is F. W. Lenz's "The Quotations from Aelius Aristides in Olympiodorus' Commentary on Plato's *Gorgias*" (*AJP*, 67, 103). Two articles of I. M. Linforth deserve mention. In "The Corybantic Rites in Plato" (*UCPCP*, 13, 121) he shows by Plato's references to these rites that in all cases he approves of them as curing the ills of the soul and that therefore they must have been purged of the excesses of many eastern rites. In "Telestic Madness in Plato, *Phaedrus*, 244, DE," he shows that Plato held ritualistic madness to be effective in curing mental disorders and that this madness is a beneficial *mania* like that of poetry, prophecy, and love (*Ibid.* 13, 163). A brilliant essay is that of A. Nehring on "Plato and the Theory of Language" (*Traditio*, 3, 13), tracing the subject from Plato to our own time.

Significant in the study of the Aristotelian tradition is J. A. McWilliams' *A Study of Saint Thomas' Commentary on the Eight Books of Aristotle's Physics* (Catholic Univ. of America Press, 1945). In his article on "Aristotle on Aesthetic Pleasures" (*CP*, 41, 43), H. L. Tracy says: "Aristotle brings to aesthetics the attitudes of the scientist and logician." H. E. Mierow in his "In Defense of Aristotle" (*CJ*, 41, 122) disagrees with Schmidt (*Gesch. d. gr. Lit.*, Munich, 1934), who maintains that Aristotle's dictum about pity and fear is a reflection of Fourth Century conditions. Mierow holds that it is an objective and universal judgment on tragedy.

In his "The Stoic Categories as Methodological Principles" (*TAPA*, 76, 246), P. De Lacy shows that the Stoics used the four categories of substance, quality, disposition, and relative disposition in all three branches of their philosophy: logic, physics, and ethics. G. Downey in "The Pagan Virtue of Megalopsychia in Byzantine Syria" (*TAPA*, 76, 279) shows the similarity of this virtue to St. Paul's Charity. E. R. Goodenough contributes "Philo on Immortality" (*HTR,* 39, 85). Finally to be mentioned is L. Spitzer's article "Classical and Christian Ideas of World Harmony, Part II," a continuation of his notable article (Cf. THE AMERICAN YEAR BOOK, 1945, 970).

HISTORY AND CIVILIZATION

In this field is to be found work of considerable variety. G. Vlastos in his "Solonian Justice" (*CP,* 41, 65) states: "The most important of Solon's social and economic reforms was prompted by his concept of political justice. Therein lies his greatness: that, despite the traditionalism of his concept of wealth, he was able to envisage this revolutionary conception of justice based on the solidarity of the *polis.*" C. A. Robinson, Jr., in "The Date of Themistocles' Ostracism" (*AJP,* 67, 265), argues for Thucydides' date (471) against that of Aristotle in the *Constitution of Athens* (462). L. E. Lord is the author of *Thucydides and the World War* (Harvard Univ. Press, Martin Classical Lectures, XII).

J. E. Charles writes on "The Anatomy of Athenian Sea Power" (*CJ,* 42, 86). A new view on ancient politics is presented by A. P. Dorjahn in his *Political Forgiveness in Old Athens* (Northwestern Univ. Studies in the Humanities, No. 13. Northwestern Univ. Press). J. A. O. Larsen, in "The Acharnians and the Pay of Taxiarchs" (*CP,* 41, 91), shows that the taxiarchs were unpaid as pseudo-Xenophon says, in that they received no regular salary, but were paid, as Aristotle says, in that they received money while on active service. H. Hill has an article on "Roman Revenues from Greece after 146 B. C." (*CP,* 41, 35). A. T. Geoghegan offers a sociological study in *The Attitude towards Labor in Early Christianity and Ancient Culture* (Cath. Univ. of Amer. Studies in Christian Antiquity, No. VI. Cath. Univ. of Amer. Press, 1945).

An interesting study in classical tradition is Z. S. Fink's *The Classical Republicans, An Essay in the Recovery of a Pattern of Thought in Seventeenth Century England* (Northwestern University Studies in the Humanities, No. IX. Northwestern Univ. Press, 1945).

RELIGION

Studies in Greek religion are significant both for the light they shed on Greek civilization and for their illumination of universal religious experience and anthropology. The work of the year in this field is concerned with various phases of the subject. C. Bonner in "Harpocrates (Zeus Kasios) of Pelusium" (*Hesp.,* 15, 51) discusses a sacred image of Zeus Kasios mentioned by Achilles Tatius in *Clitophon and Leucippe,* furnishing further evidence from four unpublished gems, three of them from Egypt. The same author writes on "Magical Amulets" (*HTR,* 39, 25). W. C. Greene, in "The Return of Persephone" (*CP,* 41, 105), shows that Persephone spent the summer in the underworld and returned to earth with the autumn flowers. The Eleusinian cult, he points out, was based on an autumn festival. D. K. Hill in "Material on the Cult of Sarapis" (*Hesp.,* 15, 60) throws light on this cult from six objects connected with it in the Walters Art Gallery in Baltimore.

In "Atheism among the Greeks" (*PAPA,* 76, xxxiv), W. W. Hyde discusses what constitutes atheism and gives a general account of its history. G. E. Mylonas, in "The Eagle of Zeus" (*CJ,* 41, 205), shows that an association connected with the Eagle of Zeus was established early in the historic period at the sanctuary of Zeus Lykaios in Arcadia and thence spread to the rest of Greece. E. Riess has an article entitled "What Is Greek Folk Religion?" (*BPIASA,* 3, 355). A slightly fanciful monograph entitled *The Genesis of Human Offspring: A Study in Early Greek Culture* (Smith College Classical Studies, 1945) discusses the Greek belief in the non-biologic origin of children and compares it with the Australian food-gatherers' (Arunta) ceremonies and beliefs.

ART AND ARCHAEOLOGY

The year's work in this field showed an unfortunate lack of material in the Minoan-Mycenaean period. With more stable conditions prevailing in the eastern Mediterranean, we may look forward with enthusiasm to new discoveries in this very important branch of archaeology. The various departments of classical archaeology are well represented. R. Pfister and L. Bellinger have completed *The Excavations at Dura-Europos Conducted by Yale University and the French Academy of Inscriptions and Letters. Part II, The Textiles* (Yale Univ. Press, 1945). S. and G. Weinberg are the authors of "Corinth: The Ancient City Revealed" (*CJ*, 42, 67), commemorating the fiftieth anniversary of excavations on that site. W. B. Dinsmoor, in "The Athenian Treasury (at Delphi) as Dated by Its Ornament" (*AJA*, 50, 86), believes the correct date to be 507 B. C., drawing his conclusions from structural, sculptural, and ceramic evidence.

R. L. Scranton is the author of an article entitled "Interior Design of Greek Temples" (*AJA*, 50, 39). G. P. Stevens, in "Architectural Studies Concerning the Acropolis of Athens" (*Hesp.*, 15, 73), discusses certain hitherto neglected aspects of the architecture of the Acropolis. The same author's "The Northeast Corner of the Parthenon" (*Hesp.*, 15, 1) is a study of the ancient monuments northeast of the Parthenon based on Pausanias' account and on archaeological evidence. A. E. Raubitschek and G. P. Stevens in "The Pedestal of the Athena Promachos" (*Hesp.*, 15, 107) hold that the inscriptions on the pedestal referred to Marathon or the Persian wars in general and that battle trophies were arranged around it.

The Figure of Dionysus in the Siphnian Frieze is the title of a monograph by V. F. Lenzen (Univ. of Cal. Pubs. in Class. Arch. Vol. III, No. 1. Univ. of Cal. Press). The tradition of Greek architecture is represented by T. and S. Hamlin's *Greek Revival Architecture in America* (Oxford Univ. Press, 1944).

In the field of ceramics the following should be mentioned: G. H. Chase, "Two Sixth-Century Attic Vases" (*BMFA*, 44, 45); V. Grace, "Early Thasian Stamped Amphoras" (*AJA*, 50, 31); S. P. Karouzou, "Choes," a study of this type of vase from the artistic and religious point of view (*AJA*, 50, 122); M. T. Milne, "Perseus and Medusa on an Attic Vase" (*BMMA*, 4, 126); A. D. Ure, "Some Boeotian Palmette Cups" (*Hesp.*, 15, 27); P. N. Ure, "Ring Aryballoi" (*Hesp.*, 15, 38); and E. Vanderpool, "Some Black-Figured Pottery from the Athenian Agora" (*Hesp.*, 15, 120). Two articles of G. M. A. Richter are "A Greek Bronze Vase" (*BMMA*, 4, 184) and "Two Archaic Bronze Statuettes" (*Ibid.* 4, 249).

G. H. Chase in "An Archaic Greek Sphinx in Boston" (*AJA*, 50, 1) discusses the colors used on the statue and dates it about 530 B. C. (Cf. *BMFA*, 43, 24 for same author's article on the same statue). Two important articles on Graeco-Persian art are H. Francfort's "Achaemenian Sculpture" (*AJA*, 50, 6), in which he says that "the Greeks and Persians are jointly responsible for the novel features of Achaemenian sculpture" in the late sixth and early fifth centuries B. C.; and G. M. A. Richter's "Greeks in Persia" (*AJA*, 50, 15), a more detailed study of the Greek influence in Achaemenian art. Mention should be made of V. E. Simkhovitch's "Some Fifth-Century Greek Heads," containing photographs of three heads in his private collection, first published at this time (*AJA*, 50, 81).

C. Edson in "A Note on the Macedonian Merides" (*CP*, 41, 107) shows by evidence of coins that Larsen in his article "Representation and Democracy in Hellenistic Federalism" (Cf. THE AMERICAN YEAR BOOK, 1945, 971) was right in stating that the four Macedonian *merides* existed down to the Flavian period. B. L.

Trell in *The Temple of Artemis at Ephesus* (Amer. Numismatic Soc'y., Numismatic Notes and Monographs, No. 107, 1945) throws new light on the ancient temple by means of numismatics. E. Jastrow, in "Terracotta Reliefs in American Museums" (*AJA*, 50, 74), shows Greek influence through Magna Graecia on Roman art. D. K. Hills' *Fashions of the Past: Ancient Greek Dress* contains illustrations from the Walters Art Gallery (Baltimore, 1945). R. P. Blake, W. Koehler, and P. J. Sachs are the authors of *Late Classical, Early Mediaeval, and Byzantine Art* (Dumbarton Oaks Papers, No. 3, Harvard Univ. Press).

INSCRIPTIONS AND PAPYRI

This is one of the most important fields of modern scholarship as it recovers new and hitherto unknown facts about ancient Greece. It is, of course, one of the first branches to be affected by war and post-war conditions. F. W. Householder, Jr. and D. W. Prakken published "A Ptolemaic Graffito in New York" (*TAPA*, 76, 108), an edition and commentary of a Greek graffito of the late third century, consisting of 18 lines in elegiac couplets, probably dedicated to the leader of an elephant expedition on the Trogodytic coast. M. T. Mitsos contributes "An Inscription from Mycenae" (*Hesp.*, 15, 115) of the first quarter of the fifth century, found in 1933. From the Agora excavations come K. Pritchett's "Greek Inscriptions," 17 inscriptions illustrated and indexed; and B. D. Meritt's "Greek Inscriptions," 61 inscriptions also illustrated and indexed (*Hesp.*, 15, 138 and 169).

H. C. Youtie writes "Critical Notes on Graeco-Roman Ostraka" (*TAPA*, 76, 140), new readings in the texts of ostraka from Karanis in the University of Michigan collection, offered as a critical supplement to the edition of ostraka published by Leiv Amundsen. E. M. Husselman in "Two Literary Papyri from Karanis" (*TAPA*, 76, 117) presents a fragment of a speech by Isocrates and one of Demosthenes. A good article on the subject of papyri is H. J. Wolff's "Papyrology: Its Scope, History, and Achievements" (*BPIASA*, 3, 384). Also to be noted in this field is *The Journal of Juristic Papyrology* edited by R. Taubenschlag under the auspices of the Polish Institute of Arts and Sciences in America.

In "The Pyloroi of the Acropolis" (*TAPA*, 76, 104), A. E. Raubitschek discusses three inscriptions throwing light on the Pyloroi, the guards of the Acropolis. Important in the study of manuscripts is K. and S. Lake's *Dated Greek Minuscule Manuscripts to the Year 1200. Indices, Volumes I-X.* (Boston, 1945, Amer. Acad. of Arts and Sciences).

MISCELLANEOUS

Ancient medicine is represented by E. J. and L. Edelstein's *Asclepius, A Collection and Interpretation of the Testimonies* (2 vols., The Johns Hopkins Univ. Press, 1945). R. Walzer is the author of *Galen on Medical Experience*, Arabic version with English translation and notes (Oxford Univ. Press, 1944). E. Evans, in "Galen the Physician as Physiognomist" (*TAPA*, 76, 287), states that Galen probably became interested in physiognomy at Smyrna where Polemo, the physiognomist, had died shortly before his arrival there.

W. H. Stahl, in "The Greek Heliocentric Theory and Its Abandonment" (*TAPA*, 76, 321), holds that the abandonment of the heliocentric theory of Aristarchus and others was a good thing for the science of astronomy, for Alexandrian scholars made wide researches and accumulated many valuable data based on the geocentric system, without which astronomical science might have been retarded by a century. He adds that the heliocentric theory was mathematical and philosophical rather than empirical.

L. Alexander is the author of "Greek and Roman Artillery" (*CJ*, 41, 208), and D. K. Hill of *Soldiers in Ancient Days*, an illustrated monograph on military equipment from ancient art in the Walters Art Museum (Baltimore). In *The Etude*

(63, 489) is an article by F. de Horvath on "The Greeks and Musical Therapeutics." N. Lewis has an article on the meaning of various terms used in loan contracts (*TAPA,* 76, 126).

In the field of the Greek dance is a monograph by D. K. Hill entitled *The Dance in Classical Times* with illustrations from the Walters Art Gallery (Baltimore, 1945). L. B. Lawler continues her studies in the Greek dance in "Pindar and Some Animal Dances" (*CP,* 41, 155), stating that P's Tenth Pythian shows the presence of comic animal dances in the cult of Apollo as early as 498 B. C. and probably earlier. Miss Lawler also has two articles explaining technical terms in the terminology of the dance (*TAPA,* 76, 59 and *AJP,* 67, 67).

SEMITIC LANGUAGES AND LITERATURES

By G. Douglas Young
Faith Theological Seminary

GENERAL

Now for the first time in a number of years European and American scholarship is again coming together. This interplay will be wholesome for the advancement of Semitic studies. Perhaps more significant even than this is the fact pointed out by E. A. Speiser (Presidential Address at the April 1946 Annual Meeting of the American Oriental Society, "Oriental Studies and Society," *JAOS** for September) that the war brought a meeting of East and West all along the line. Research in these fields was a basic necessity since the Near East has resumed its former role as one of the keys to world power. Knowledge of its states and provinces is vital; hence a heavy burden of responsibility now rests on Oriental studies.

Of general interest will be the "Catalogue" of the material in the Cleveland Public Library made by F. E. Sommer and published in *JAOS* for September. The index of articles and archaeological reports, together with a list of books, articles, and reprints noted in the Bulletins, numbers 81-100, is published in *BASOR* for October.

ARCHAEOLOGY

Because of the bearing on important problems confronting Semitic scholars, reference should be made to material of a strictly archaeological nature. Brigadier E. J. Ross in *JNES* for October describes "A Chalcolithic Site in Northern Baluchistan," to wit, Rana Ghundai. Important prefatory remarks are made by Donald E. McCown, who notes the interconnections of the civilizations of this early period. The pottery of the site is illustrated. Nelson Glueck contributes two books and three important articles on the archaeology of the Jordan area with his *The River Jordan; The Other Side of the Jordan;* and "Transjordan" in *BA* for September; "Band-slip Ware in the Jordan Valley and Northern Gilead" in *BASOR* for February, a discussion of the distribution of the typical Early Bronze I pottery, with plates; and "A Settlement of Middle Bronze I in the Jordan Valley" in *BASOR* for December (1945), constituting a discussion of Tell Umm Hamâd el-Gharbī, with plates of the pottery. J. L. Kelso and J. Polin Thorley have collaborated in *BA* for December (1945) to produce a discussion of "Palestine Pottery in Bible Times."

SEMITIC PHILOLOGY

F. R. Blake presents the fourth in his "Series in Semitic Grammar" in *JAOS* for September. Here he discusses the "emphatic" consonants; the vocalization of the pretonic open syllable in Hebrew; and the Aramaic *z* for Semitic *z*, and *d*. In *JBL* for March the same writer discusses also the "Form of Verbs After Waw in Hebrew."

---

* Abbreviations used in this article: *JAOS, Journal of the American Oriental Society; JBL, Journal of Biblical Literature; JNES, Journal of Near Eastern Studies; JQR, Jewish Quarterly Review; BA, Biblical Archaeologist; BASOR, Bulletin of the American Schools of Oriental Research.*

CUNEIFORM STUDIES

Two important books have appeared in this field. Alexander Heidel's *The Gilgamesh Epic and Old Testament Parallels* presents us with a new translation of the Epic and several related myths together with comparisons with the Old Testament. There are two large chapters on "Death and the Afterlife" and "The Story of the Flood." O. Neugebauer and A. J. Sachs have added another contribution along mathematical and astronomical lines with their *Mathematical Cuneiform Texts.*

Albrecht Goetze in *JAOS* for December (1945) gives us "The Vocabulary of the Princeton Theological Seminary" (P.T.S.1) with a copy, transliteration, and commentary of this new text. In *JNES* for July the same author makes another contribution in his "Number Idioms in Old Babylonian." On a related theme in the same issue is A. J. Sachs' "Notes on Fractional Expressions in Old Babylonian Mathematical Texts." T. J. Meek adds to his contributions on Semitic syntax with "The Asyndeton Clause in the Code of Hammurabi" in *JNES* for January. In the field of interpretation several valuable contributions are to be found. A. Leo Oppenheim, in "Assyriological Gleanings IV," to be found in *BASOR* for October, shows that there exist scattered references to a Mesopotamian Harvest Song comparable to those of Egypt, Ugarit and the Greeks. Thorkild Jacobsen in *JNES* for April presents "Sumerian Mythology: A Review Article," and in *BASOR* for April another extended review, that of Dr. Kramer's *Sumerian Literary Texts for Nippur,* under the title "New Sumerian Literary Texts." Julius Lewy discusses "The Late Assyro-Babylonian Cult of the Moon and Its Culmination at the Time of Nabonidus" in the *Hebrew Union College Annual* (Vol. XIX).

In *JAOS* for September, R. G. Kent, in his "The Oldest Persian Inscriptions" concludes that the Old Persian syllabary was used for inscriptions of Cyrus the Great, but that there is no evidence that it was used at an earlier date. "The Vocative in Hittite" is the basis of a discussion by H. G. Guterbock (Ankara) in *JAOS* for December (1945).

EGYPTIAN

In *JNES* of January is another important contribution from the prolific pen of W. F. Albright, "Cuneiform Material for Egyptian Prosography 1500-1200 B.C.," being a list of Egyptian names in cuneiform with an excursus on accent and vowel quantity in New Egyptian. We find again material from the pen of Hermann Ranke in *JAOS* for December (1945) "A Late Ptolemaic Statue of Hathor from Her Temple at Dendereh," with a discussion and translation of the inscription, together with a copy of the text itself. Kurt Pflüger gives us "The Edict of King Haremhab" with text, translation, commentary and notes in *JNES* for October. Of wide interest to Egyptologists will be the full bibliography of a great Egyptologist, George Steindorff, compiled in commemoration of his 84th birthday by James H. Breasted, Jr., and published in *JAOS* for March.

Egypt is well represented in books by the publication of the third edition of J. H. Breasted, *History of Egypt;* of the second edition of W. S. Smith, *Ancient Egypt as Represented in the Museum of Fine Arts* (Boston), and the late G. A. Reisner's *History of the Giza Necropolis,* Vol. I.

CANAANITE

Two outstanding contributions were made during the year by T. H. Gaster, two by Julian Obermann, and one by H. L. Ginsberg in the field of Ugaritic studies. In *BASOR* for February, Gaster discusses II AB with text and translation, "A King Without a Castle: Baal's Appeal to Asherat"; and in *JAOS* for March is his "A Canaanite Ritual Drama: The Spring Festival at Ugarit." Gaster concludes that the latter is nothing but the order of service for the Canaanite festival of first fruits in the spring, the prototype of the Israelitic Feast of Weeks (Pentecost) and that it includes the libretto of a sacred pantomime then performed. In a supplement to *JAOS,* Julian Obermann presents a text, introduction, commentary, and discussion of *How Daniel Was Blessed with a Son: An Incubation Scene in Ugaritic.* In *JBL* for September in "Sentence Negation in Ugaritic" he presents evidence for the negative use of *l.* A very important contribution to this field is Ginsberg's *The Legend of King Keret: A Canaanite Epic of the Bronze Age,* with text, introduction, translation, copious notes and a bibliography of old and new publications on the Keret texts.

B. Maisler in *BASOR* for April in "Canaan and the Canaanites" presents a discussion of the relation of the name of the land to the word *kinaḫḫu* in the Akkadian dialect of Nuzi and to the word *Kyn'nw* in Egyptian.

SOUTH SEMITIC

"The Present State of Ethiopic Linguistics" is discussed by Wolf Leslau in *JNES* for July. From the pen of the same writer two other contributions to this field have come: his "Bibliography of the Semitic Languages of Ethiopia," published for the New York Public Library in pamphlet form, and his "Linguistic Observations on a Native Yemenite Document" in *JQR* for January. Nabia Abbott in *JNES* for July presents us with "An Arabic Papyrus in the Oriental Institute: Stories of the Prophets." Other texts have been published by Anis Frayha and the team of H. H. Spoer and E. S. Haddad. Frayha's "New Yezīdī Texts from Beled Sinjar, Iraq," is a history of the discovery of the texts with a translation and commentary. A list of the sparse references in Arabic literature to 'Adi and the Yezīdīs as well as a short history of the Ju'fī family is included. The texts are those of the two sacred books, *Kitāb al-Jalwah* and *Misḥaf Resh,* poems ascribed to 'Adi and short stories. These are published in *JAOS* for March. In the same publication for June Spoer and Haddad present Part II of their "Poems by Nimr Ibn 'Adwán, XXI to XLIV'" with text, translation and commentary. (Part I in *JAOS,* January 1945.) Mehmet Aga-Oglu gives a study of the terminology of Islamic Art in *JNES* for October in "The Origin of the Term MINĀ and Its Meanings." "On Suicide in Islam" by Franz Rosentahl, *JAOS* for September, is a discussion of the religious and non-theological opinions concerning this question, together with the reported cases chronologically presented. P. B. Cornwall in *BASOR* for October enters the lists "On the Location of Dilmun." He concludes with those who hold it to be the island of Bahrein, but adds that at least during some periods it included a stretch of territory on the nearby Arabian mainland as well. From the Persian Gulf another of the Himyaritic Inscriptions has come and is discussed by F. V. Winnett in *BASOR* for April.

BIBLICAL

Contributions to the Biblical field include historical, textual, and interpretative studies. Jack Finegan's *Light from the Ancient Past* describes many valuable contributions to our knowledge of the life, literature, and archaeology that constitute the background of the Hebrew-Christian religion. *Re-Discovery of the Old Testament* was contributed by H. H. Rowley.

Two especially noteworthy historical contributions come from the pen of W. F. Albright, "The Chronology of the Divided Monarchy of Israel" (a complete re-examination of the problems, together with tables), in *BASOR* for December (1945), and "A Brief History of Judah from the Days of Josiah to Alexander the Great" in *BA* for February. A history of a later period is presented by E. Taeubler in *JQR* for July, "Jerusalem 201 to 199 B.C.E. on the History of a Messianic

Movement." C. Umhau Wolf discusses the "Terminology of Israel's Tribal Organization" and concludes that the terms can not be exactly defined. C. C. Torrey in *JAOS* for March in "Medes and Persians" presents the thesis that the entire Israelite scheme is a creation of patriotic and religious fervor which stands by itself and can not be fitted into any Gentile history. Elias J. Bickerman of the École Libre des Hautes Études, on the other hand, in *JBL* for September points out that "The Edict of Cyrus in Ezra I" is a genuine edict of Cyrus which had the same mode of promulgation, by herald and through poster, as the Roman edictum. S. Zeitlin presents Part I of his "An Historical Study of the First Canonization of the Hebrew Liturgy" in *JQR* for January. "The Dissident Laity in Early Judaism" is discussed by S. H. Blank in the *Hebrew Union College Annual* (Vol. XIX).

A number of textual studies has appeared. A. Wikgren in *JNES* for July discusses "Two Ostraca Fragments of the Septuagint Psalter." "The Septuagint: Its Use in Textual Criticism" is presented in *BA* for March from the pen of H. M. Orlinsky. *"Semel Ha-Qin'ah Ha-Maqneh:* Ezekiel 8:3 & 5" is discussed by H. Torczyner in *JBL* for September; *"Hā-Rōqclīm* for *Hā-Rēqīm* in II Samuel 6:20" by Orlinsky in *JBL* for March; and Frank North attempts to reconstruct the text in his "The Oracle Against the Ammonites in Jeremiah 49:1-6" in the same issue of *JBL.*

In *JNES* for January, O. R. Sellers discusses "Limits in Old Testament Interpretation," and Wm. A. Irwin the "Poetic Structure in the Dialogue of Job." In the following issue of *JNES* is presented G. E. Wright's "The Literary and Historical Problem of Joshua 10 and Judges 1." "Moses and the Sinai Inscriptions" is the basis of the discussion by H. G. May in *BA* for December (1945). Psalms 23 and 29 receive important consideration, the first by J. Morgenstern in *JBL* for March and the second by T. H. Gaster in *JQR* for July. The former is a discussion of date, authorship, speaker, text, meter and unity of thought, the latter presents the thesis that the Psalm is a typical "hymn of laudation." Morgenstern discusses two other Psalms, "Psalm 8 and 19A" in the *Hebrew Union College Annual* (Vol. XIX). "The Second Psalm" receives the consideration of Isaiah Sonne in the same book.

Though perhaps peripheral to this field, there is another beautifully illustrated book that will be of interest to many, F. Landsberger's *Rembrandt, the Jew and the Bible.*

SLAVIC LANGUAGES AND LITERATURES

By Anthony J. Klancar
Editor and Writer

GENERAL

Slavic Studies, particularly the Russian field, have made tremendous progress in the last two years. In a recent survey, conducted by *The New York Times,* may be found impressive data regarding this new interest in Slavic. At the time of Pearl Harbor, only 19 American institutions of higher learning were offering courses in Russian. Today the number is well over 110. This interest is not merely a temporary, wartime product. Since V-J Day there has been a growth of 35 per cent in the number of institutions offering Russian. About 25,000 Americans are now studying Russian in schools and colleges in all parts of the country. Educators now believe that Russian will take a permanent place among college courses and will compete with such traditional subjects as French, German, and Spanish.

Columbia University offers more courses in Russian than at any other time in its history. It offers a well-rounded program of subjects in history and government in its Russian Institute, the only school of its kind on the graduate level which prescribes a two-year program touching on all phases of Russian life. Twelve lecture courses and research seminars are given in Russian history, economy, government, law, foreign relations, official ideology, and literature. Yale University has introduced a program of Russian studies for undergraduates, stressing the relation of the U.S.S.R. to the Western and Far Eastern world. A specialized course in scientific Russian is now offered at the University of Chicago. The University of Washington (Seattle) reports an unprecedented increase in the number of students in Russian language, history, and literature.

Several institutions, such as Harvard, California, and Columbia, have established full-fledged Slavic departments, which offer courses in many Slavic subjects. The Department of Slavic Languages in Columbia University may well be taken as a model for other departments. Together with Harvard University and the University of California, Columbia may boast of having one of the oldest Slavic departments in the United States. Over a period of years, several outstanding American and European Slavicists have been added to its growing staff. Foremost among these is Ernest J. Simmons, head of the department and authority on Tolstoy and Pushkin. Roman Jakobson, Masaryk professor of Czechoslovak studies, has a worldwide reputation as a Slavic philologist. Equally distinguished is Karl H. Menges, one of the few Altaicists in the United States. Clarence A. Manning was one of the earliest American scholars to teach in the Slavic field; he is an outstanding authority on Ukrainian literature and a pioneer in many other Slavic fields. In the United States, Arthur P. Coleman, George R. Noyes of the University of California, and Mme. Elena Mogilat, a teacher of Russian at Columbia University, are pioneers in Polish studies and the general Slavic field.

Probably the greatest single factor in the development of Slavic Studies in the United States today is the Rockefeller Foundation. In 1946, the Foundation made a grant of over $200,000 to Stanford University's Hoover Institute, which is to be used in awarding fellowships in Slavic Studies, mainly in the fields of the humanities and the social sciences.

BIBLIOGRAPHY

To the student of Russian and other Slavic languages, the Library of Congress offers a collection of more than 200,000 volumes, the largest collection of its kind in the Western Hemisphere. Details of the collection are described by Sergius Yakobson in "The Library of Congress, Its Russian Program and Activities" *(*ARSU* 7, No. 4, 51-66).

Another famous collection is discussed in general terms by Dimitri von Mohrenschildt in "Bibliography: Darmouth Collection of Historical Material on the Russian Revolution" (*RR* 6, No. 1, 105-112). Both of these articles are valuable as introductions to historical and cultural sources necessary for any study of Soviet Literature coming out of the Revolution of 1917-1921. Joy Moss' "Books on Soviet Culture" (*ARSU* 7, No. 3, 51-57) is a useful cultural bibliography covering briefly the most important books in English on the theatre and cinema, literature, etc. A good, general list of all books and articles published here and abroad is "Books and Articles on Russia Published in 1945" (*RR* 5, No. 2, 116-129). In the Polish field, Arthur F. Coleman and Marion M. Coleman have contributed in their annual, *Mickiewiczana* (41-54), more additions and corrections to their tentative bibliography of translations into English from the Polish of Adam

---

* Abbreviations used for periodicals are: *ARSU—American Review on the Soviet Union, ASEER—American Slavic and East European Review, NM—New Masses, PMLA—Publications of the Modern Language Association, PR—Polish Review, RR—Russian Review, SR—Slovak Review, UQ—Ukrainian Quarterly.*

Mickiewicz, found in their *Adam Mickiewicz in English* (1940). An indefatigable bibliographer of Slavic, Mrs. Coleman gives a brief history of Bulgarian studies in England and America in her "Bulgarian Materials in English" (*Comparative Literature News-Letter* 4, No. 5, 35-36).

Reviews of current books on Slavic languages and literatures may be found in all of the periodicals mentioned in this article, but special mention must be made of the general bibliography of work done by American scholars, which is published in the *PMLA* supplement for March. For a current list of books and articles on Soviet Russia see *The American Review on the Soviet Union.* Specialized bibliographies may be found in the *Ukrainian Quarterly* and the *Slovak Review,* a new publication devoted to a little-known Slavic field.

Increasing in usefulness and authoritativeness, the *Bulletin of the American Association of Teachers of Slavic and East European Languages* is the best all-round source of information on any Slavic subject. It contains reports on progress made in the Slavic teaching field, materials for teaching Slavic languages, reviews of recent important articles and books published in Europe and the United States, special articles on the history of Slavic Studies, on literature, and language, etc. by experts in the field, as well as news of work in progress by specialists in various other fields. The *AATSEEL Bulletin* is a quarterly edited by Marion M. Coleman and published in mimeograph form for members of the American Association of Teachers of Slavic and East European Languages.

SLAVIC—GENERAL

One of the most important studies in the Slavic field to appear in recent years is Henri Grégoire's "L'Origine et le Nom des Croates et des Serbes" (*Byzantion* 17, 1944-45, but published in 1946, pp. 88-118). Professor Grégoire makes a sensational discovery as regards the origin and the name of the Serbs and Croats. He bases his thesis on the Greek texts generally printed under the Latin title *De administrando imperio,* written by Emperor Constantine VII (950 A.D.); the story of Chrobatos, leader of the Croat migration, also called Koubrat or Kouvrat, found in the works of the Egyptian John of Nikiou and the Byzantines Nicephorus the Patriarch and Theophanes the Confessor, historians of the 7th and 9th centuries. From this latter source we learn that the name of the Croat leader is the same, as in the previous reference the date is identical, as the Byzantine emperor Heraclius; his first successor Kouvrat revolts against the Avar empire, makes friends with the Byzantines, and has his people baptized.

However, the most important fact uncovered by Professor Grégoire is that Kouvrat was in reality a Bulgarian chieftain, not a Slav. This fact is fully confirmed by a third source, the so-called royal roster of Bulgaria which lists for the first half of the 7th century a Bulgarian king or khan named Kurt Kouvrat. There is still a fourth, parallel document, the story of the "Miracles of St. Demetrius," the patron saint of Thessalonica. Here again, at the same date, figures a Bulgarian chieftain called Kouber or Kouver (another form of the same name) who is said to have led a revolt of several tribes, mainly Bulgarians and Slavs, against the Avars and afterwards crossed the Danube, got in touch with the imperial authorities and settled his Slavic subjects somewhere south of the Danube in Macedonia.

On the same high level of scholarship is Karl H. Menges' "Etymological Notes on Some *Păčănăg* Names" (*Byzantion,* 256-280). Professor Menges brings a vast knowledge to his study of *Păčănăg* (Turkic) loanwords in Old Church Slavonic. So too the late Samuel H. Cross' last published article "Primitive Civilization of the Eastern Slavs" (*ASEER* 5, Nos. 12-13, 51-87) is a monument to his great scholarship.

RUSSIAN LANGUAGE

In order to understand properly and fully Russia's cultural and scientific achievements we must study these at their source in Russian, according to Dederich Navall's "Why Learn Russian" (*Modern Language Journal,* 30, No. 6, 355-57). Some interesting arguments as to why learn Russian may be found in Marion M. Coleman's "Twenty-Five Years of Teaching Russian at Columbia" (*RR* 6, No. 1, 84-90), a fine tribute to Mme. Elena Mogilat, a wonderful teacher and a pioneer in teaching spoken Russian.

Alfred Senn continues in "College Russian: Objectives and Methods" (*ASEER* 5, Nos. 12-13, 176-186), a discussion begun by Professor Cross in his "Teaching College Russian." Professor Senn concludes: "The cultural values of a language are contained in its written form. Therefore, the written language must be the primary aim of all foreign language teaching . . ." As an example of the spoken language method see Lesnin, Bloomfield, and Petrova's *Spoken Russian* (Holt), which is written according to new criteria set up for the Army Specialized Training Program by the American Council of Learned Societies and the Linguistic Society of America.

Many revised editions of old grammars are now available. Of these, Agnes Jacques' *A Russian Primer* (Packard) is by far one of the best all-round grammars and readers. The treatment of verbs is very good, and there is some excellent material for readings from science and technology. Here we may also mention J. W. Perry's *Chemical Russian Self-Taught* (Chemical Engineering Publishing Co., Easton, Pa.). Joseph E. Harsky's *A Workbook in Russian* (Pitman) is a pioneer attempt. For use with Bondar's *Simplified Russian Method,* it applies the latest methods in language teaching.

RUSSIAN BIOGRAPHY

Tolstoy.—A major work of American literary scholarship, Ernest J. Simmons' *Leo Tolstoy* (Little, Brown), brings Tolstoy back to life in an account of nearly every year of the great Russian's life, tracing the evolution of his art and thought. Professor Simmons' account of the family crisis, which so embittered and drove Tolstoy out of his home during the last years of his life, is given accurately and in full for the first time. Through Professor Simmons we come to a renewed appreciation of Tolstoy's great vitality and of his health and tenderness. We have here a definitive, incomparable Tolstoy biography.

Gorky.—In contrast, we have Alexander Roskin's *From the Banks of the Volga* (Philosophical Library), dealing with the life of Maxim Gorky, one of the most influential writers of Modern Russia. First published in Moscow in 1944, Roskin's biography is an example of Soviet biography at its worst. More profitable reading is Maxim Gorky's *Reminiscences* (Dover), a great journalist's memories of Tolstoy, Chekhov, Andreyev, Blok, etc.—men who were of Titan size in a period of Titans.

Dostoevski and Others.—Henry Troyat's biography, *Firebrands: The Life of Dostoevski* (Roy Publishers), is a documented record of how the Russian novelist conceived and created his heroes, as well as an interpretation of his major works. On the other hand, Lydia Lambert's *Pushkin, Poet and Lover* (Doubleday) is a romantic, fictionized biography of an early 19th century Russian poet who deserves better treatment. Fan Parker deals otherwise with Vsevolod Garshin (King's Crown Press), best known to his English readers for his stories, *Four Days.* A very useful book, Valentine Snow's *Russian Writers* (International Book Service) covers the period from the Age of Catherine II to the October Revolution in 1917 in the lives and works of some 200 Russian authors, alphabetically arranged.

RUSSIAN DRAMA

According to Ernest J. Simmons, writing on "Soviet Drama and the War" (*New Republic* 114, No. 17, 625-7), the chief fault in Soviet dramas is their lack of "sharp dialogue and professional mastery," qualities which are much admired in our own American dramas. Professor Simmons was discussing a recent collection of

Seven Soviet Plays. This lack may also be seen in Alexander Bakshy's *Soviet Scene: Six Plays of Russian Life* (Yale Univ. Press). The translator chose these plays as a cross section of Soviet dramatic tastes from the 1917 Revolution to the Second World War. All are written as Soviet propaganda-drama history and deal with such themes as the Civil War (Trenyov), reconstruction period following the Revolution (Pogodin), Trans-Siberian Railway (Afinogenov), marriage and family (Shkvarkin), old values redeemed (Ilyenkov), and the best in the lot, Marshak's *Twelve Months,* a lyrical fantasy on the old Christmas pantomime model.

For an insight into how a Soviet playwright creates, we must read Maxim Gorky's "A Letter to Slanislavsky" (*NM,* LIX, No. 12, 6-10), in which Gorky builds up a play before your very eyes, tapping the "untouched strata of personal impressions which lie in the soul of every man." In his devastating article "Looking at the American Theatre" (*NM,* LXI, No. 1, 4-7), Konstantin Simonov compares play production in New York and Moscow and finds that the "almighty dollar" rules the art of our American theatre. "A theatre where the actors do not work for profit or cheap popularity is an excellent manifestation." The recent reorganization of the Soviet theatre is discussed in Norris Houghton's "National Theatres of the World" (*Theatre Arts* 30, 533-37).

RUSSIAN POETRY

Pushkin.—Waclaw Lednicki is one of the greatest of Pushkinists. In his "Polish Scholarship and Pushkin" (*ASEER* 5, Nos. 12-13, 88-92), Roman Jakobson discusses the contributions made by Polish Pushkin scholars in the two-volume work *Pushkin 1837-1937,* edited in 1939 by W. Lednicki. Read also W. Lednicki's "Bits of 'Table-Talk' on Pushkin" (*ASEER* 5, 93-110), in which Lednicki contributes some new ideas on the polemic of Pushkin with Mickiewicz that will go down in the history of Russian literature. Criticism of Pushkin is one thing, but appreciating him is another. Alexander Fredericks tries to explain the obstacles in the way of European and American appraisal of Pushkin in a stimulating article called "Pushkin for Americans" (*RR* 5, No. 2, 83-89). Pushkin's poetry is untranslatable because he was a creator of language and the portrayer of the unfathomable Russian heart.

Gumilev.—Two anniversary pieces on Gumilev, a great master of modern Russian poetry, have come from the pens of Leonid I. Strakhovsky and Gleb Struve. According to Professor Strakhovsky, "Nicholas Gumilev" (*RR* 6, No. 1, 37-42) was master of a school of poetry, the Acemeism, and an influential teacher of poetic technique. In his piece, "Blok and Gumilyov" (*Slavonic Review* 25, No. 64, 176-180), Gleb Struve says these two had little in common although they were contemporaries in a country upheaved by war and revolution.

RUSSIAN CRITICISM AND FICTION

Gorky.—Divergent interests and tastes are shown in the great mass of literary criticism and fiction that appeared in 1946. Maxim Gorky's first novel *Orphan Paul* (Boni & Gaer) commemorates an important event in Soviet Literature. Included in this volume is Gorky's essay on "How I Became a Writer," also found in *New Masses* (Vol. LXI, No. 7, 12-15; No. 8, 15-19). Through this essay are glimpses of Gorky's early development, his youthful reading, his own confession of the influence of foreign authors, the reason why he wrote about tramps, and his advice to young Soviet writers.

Turgenev.—What remains permanent and imperishable in Turgenev is the romantic appeal of his art and imagination. So says William H. Chamberlin in "Turgenev: The Eternal Romantic" (*RR* 5, No. 2, 10-23).

Pechorin.—Lermontov's *The Hero of Our Times* (Pechorin) is the subject of Clarence A. Manning's "Lermontov and the Character of Pechorin" (*Modern Language Quarterly* 7, 93-104). One of the first novels in

Russian literature to analyze psychologically a contradictory character, the book caused Lermontov's critics to claim Pechorin's character as the author's own.

Dostoevski.—Hans Kohn devotes a chapter (V) in his *Prophets and Peoples* (Macmillan) to Dostoevski as spokesman of the Russians, while Mischa H. Fayer discusses the same author as a factor in Gide's development in *Gide, Freedom and Dostoevski* (Lane Press).

Historical Novels.—Michael Karpovich's "Soviet Historical Novel" (*RR* 5, No. 2, 53-63) gives a general outline of Soviet fiction from the viewpoint of subject matter and the author's general approach in the novels of Chapygin, Tynyanov, Alexis Tolstoy, Kostylev, Borodin.

Family Life Novels.—Drawing upon Soviet literature as one source of her data, Vera Alexandrova traces, in "The Soviet Family" (*RR* 5, No. 2, 74-82), the downfall of the old Russian family, the life of the new Russian woman, love as "naked physiology," the child as a being with feelings. Compare family life in the following. Philp Rahv's *The Short Novels of Tolstoy* (Dial Press) includes eight shorter pieces, among which are "The Cossacks" and "Hadji Murad," two of the greatest stories Tolstoy ever wrote.

INFLUENCE OF AMERICAN AUTHORS IN RUSSIA

From Robert Magidoff's "American Literature in Russia" (*Saturday Review of Literature* 29, No. 44, 1-11, 45-46), it is learned that Franklin was the first American author to be translated into Russian; Poe and Whitman influenced Russian poetry of the 90's; Mark Twain and Jack London are best loved; Ernest Hemingway is the most eagerly read and the most passionately argued contemporary foreign author. Franklin had an early 18th century admirer in Denis Ivanovich Fonvisin, Russian playwright, writes Nina A. Toumanova in "Franklin and Fonvisin" (*Slavonic Monthly* 2, No. 10, 3-5). Peter Lavrov, the great Russian social philosopher, wrote a critique of Longfellow which reflects "the continuing awareness of America in the thought of the nineteenth-century Russian radicals, an interest hitherto ignored by American scholarship." David Hecht's "Lavrov and Longfellow" (*RR* 5, No. 2, 90-96) should be read.

A lyric poet on a Schillerian model, Zhukovski, single-handed, accomplished the work of popularizing Schiller in Russia. Charles E. Passage's "The Influence of Schiller in Russia 1800-1840" (*ASEER* 5, Nos. 12-13, 111-137) is the first in a series of articles dealing with this subject. While literary ties in Soviet Russia bind strongest with American literature, "Russian Emigré Literature in World War II" by Helen Iswolsky (*RR* 6, No. 1, 69-76) is bound to French literature by ties made by the Paris Group in whom "the twofold trends inspired by the Resistance and by a national feeling are clearly reflected . . ." Russian emigré writers in the United States are mainly absorbed in writing historical novels or literary criticism and belles lettres, unaffected by the war.

UKRAINIAN LITERATURE

Franko's long narrative poem, *Moses,* is one of the great masterpieces of Ukrainian literature. The poem vividly reveals Franko's personal views as to the future of his people and his own conception of the type of leader his people need. Clarence A. Manning analyzes these problems in "The Moses of Ivan Franko" (*UQ* 2, No. 3, 227-235). The third great name in Ukrainian literature is "Lesya Ukrainka" (*UQ* 2, No. 3, 252-64). Percival Cundy says of her in the above article: "Surpassing Franko, she is inferior only to Shevchenko in poetical achievement."

POLISH STUDIES

Polish ranks next to Russian as a taught subject. The reason for this may be found in a booklet *Survey of Polish Teaching in the United States* (Tatra Club), by Francis Bolek and A. P. Coleman. Such articles as Paul R. Selecky's "Polish Studies in Pennsylvania" (*PR* 6, No. 10, 10-11) and Sister Mary Edwina's "The Teaching of Polish in Connecticut" (*PR* 6, No. 11, pp. 13, 15) are important source material for a future history of Slavic Studies in the United States. They show the struggle of large minorities to place their language in high schools and colleges in purely Slavic areas. In Connecticut, for instance, formal teaching of Polish goes back to the latter half of the 19th century. Pioneers in Polish studies in that state have been James Gates Percival, William James Linton, and Arthur P. Coleman.

POLISH LITERATURE

Sienkiewicz.—Although America was not a favorite theme with Poland's writers, nevertheless it entered the Polish novel as a theme as early as 1837. Sister M. Andrea finds, in her illuminating article "America in the Polish Novel" (*Polish-American Studies* 3, Nos. 1-2, 13-20), the American scene depicted in some 16 authors, the most famous among these being Sienkiewicz and Reymont. For example, Sienkiewicz' "The Lighthouse Keeper of Aspinwall" deals with a Polish exile whose patriotism is revived when a copy of Mickiewicz' *Pan Tadeusz* falls into his hands. In "Because of Sienkiewicz" (*PR* 6, No. 10, 4-6), Wladyslaw Reymont tells how, in 1888, he first discovered his famous compatriot, an event which was a turning point in his life, embarking him upon a writing career that brought him world renown as a novelist.

Mickiewicz continues to preoccupy students of Polish poetry. One of the chief sources for becoming acquainted with this poet is *Mickiewiczana*, an annual collection of articles, translations, and other Mickiewicz items. Some little known facts about "Mickiewicz and his American Friends" (*PR* 6, Nos. 6, 6-7, 12, 15) are brought out by Leopold Wellisz. Poland's greatest poet was bound by friendship and ideological closeness with Cooper, Morse, Margaret Fuller, and Emerson to whom Mickiewicz was first to draw attention in France. Especially interesting for students of Polish music should be Lubov Keefer's "The Influence of Adam Mickiewicz on the 'Ballades' of Chopin" (*ASEER* 5, Nos. 12-13, 38-50). Worthy of mention here is Marion M. Coleman's splendid translation of Mickiewicz' "A Polish *Lenore:* The Flight" (*ASEER* 5, 34-37).

Folklore and Legends.—Much of Polish folklore has entered into the poetry of "Kasprowicz—the Poet of the Soil" (*PR* 6, No. 2, 6-7, 14). K. Stywiarski considers him as one of the finest lyric poets of modern Poland. Highlighting certain fundamental Polish attitudes toward liberty and tolerance, the home, death, women, motherhood, God and war, Halina Chybowska's "Wit and Wisdom of the Poles" (*PR* 6, No. 4, 8-9) says truly: "Proverbs are the wisdom of nations." In a volume of Polish legends *Prince Godfrey* (Roy), Halina Gorska gives 12 stories of a splendid Polish hero, "the knight of the star of the nativity."

SHAKESPEARE IN POLAND

For those interested in the Shakespeare influence in world literature, Josephine Calina's "Shakespeare in Poland" (*PR* 6, No. 5, 6-7, 14) should be a revealing item. It is condensed from a 76-page work of the same title, published by the Shakespeare Association (London, 1923).

SLOVAK

A handy booklet on a little publicized subject, Ivan J. Kramoris' *A Chronological Outline of Slovak Literature and History,* covers a period from the sixth century to 1939. Biographer of SS. Cyril and Methodius, the Apostles of the Slavs, Father Cyril J. Potocek writes authoritatively on the relationship between Slovak and Old Church Slavonic in his "The First Written Slovak Language" (*SR* 1, 5-8). A. A. Banik traces "The National Name of the Slovaks" (*SR* 1, 9-18) from *Sloven* through various changes to *Slovak* and *Sloviak.* Slavic literary historians will be interested in Ivan Houdek's study of "Janosik" (*SR* 1, 30-46). Juro Janosik, the Slovak Robin Hood, has been a favorite subject with Polish, Ukrainian, and Russian novelists, poets and folklorists. Houdek traces the Janosik legends through a maze of documentary evidence to prove that Janosik did exist in fact and not only in the imagination of the Slovak peasant. Another publication, P. P. Yurchak's *Slovak's, Their History and Traditions* (Obrana Press, Scranton, Pa.), is excellent for its chapters on the Slovak National Revival and the Slovak Renaissance, a period during which the Slovak literary language saw its greatest development.

YUGOSLAV LINGUISTICS

Few good grammars of Serbo-Croatian exist in English, and Carleton T. Hodges' two-volume *Spoken Serbo-Croatian* (Holt) is a welcome work for all students of Slavic languages. The learning unit consists of basic sentences, word study through inductive grammar, review, listening in to dialogue, conversation, and a finder list. Professor Hodges' "Serbo-Croation Phonemes" (*Language* 22, No. 2, 112-120) should arouse much discussion in linguistic circles. This phonemic description is based on the speech of two informants, both Serbs from Croatia.

YUGOSLAV LITERATURE

The most interesting modern Yugoslav dramatists are Krleza, Nusic, and Cankar of the older generation; Jevtic, Cesarec, and Kreft, of the younger. "Modern Yugoslav Drama" (*ASEER* 5, Nos. 12, 13, 1-18), by Wayne S. Vucinich, gives first-rate accounts of all of these. There is also a good bibliographical survey of the literature on Yugoslav drama. In the same review (19-33) also appears Anthony J. Klancar's comparative study of "Josep Jurcic, the Slovene Scott." Jurcic (1844-1881) was the first among the Yugoslav writers to apply the ideas of Scott in his writings. One of his best novels *Deseti brat* (The Tenth Brother) borrows the plot of Scott's *The Antiquary*. The development of Slovene literature and Language from the 16th century to the period of the greatest of Slovene writers, Ivan Cankar and Oton Zupancic, is treated in the same author's "Slovenia and the Slovenes" (*Journal of Central European Affairs* 6, No. 1, 13-16).

INDO-EUROPEAN LINGUISTICS*

By George S. Lane
Professor, University of North Carolina

METHODOLOGY CONTROVERSY

The controversy over the methods of descriptive linguistics reported in some detail in The American Year Book (1945, pp. 983 f.) have continued; for example, in Robert Hall's article "The State of Linguistics: Crisis or Reaction" (*Italica* XXIII, 30-34), and the answer to it by Leo Spitzer (*MLN* LXI, 497-502). In addition, there has now been injected into this disagreement between the formalistic and mentalistic approaches to language study, the dispute over methodology between the older school of "neogrammarians" and "neolinguists." This dispute has already been touched upon in preceding reports in connection with discussion of the validity of the "laryngeal hypothesis" (cf. The American Year Book (1941, p. 908; 1942, p. 902; 1943, p. 902; 1945, p. 984).

The chief sponsor in America of the so-called "age and area theory" of the "neolinguists" is the Italian scholar G. Bonfante who has continued his controversy with A. Goetze in two articles, the first "Hieroglyphic Hittite, Indo-Hittite and the Linguistic Method" (*JAOS* LXV, 261-264) with an answer by Goetze (*ibid.* LXVI, 88), and the second "Indo-Hittite and Areal Linguistics" (*AJP.* LXVII, 289-310). The latter entails a detailed application of the methodology of the "neolinguists" to the Indo-Hittite hypothesis. Other discussions by the same scholar but with use of Romance, specifically Italian, materials are found in "A Remark on the Spread of Phonologic Change" (*PMLA* LXI, 1-6), "On Reconstruction and Linguistic Method" (*Word* I, 83-91), "Neogrammarians and Neolinguists: Italian *guglia*" (*Rom. Rev.* XXXVI, 240-243), and "Neogrammarians and Neolinguists: Italian *giorno*" (*PMLA* LIX, 877-881). To the last two titles we have the rejoinder by Robert Hall "Italian *guglia, giorno* and the Neogrammarians," together with Bonfante's reply (*Rom. Rev.* XXXVIII, 244-251).

---

Rev.—Romanic Review; Cl.P.—Classical Philology; MDU—Monatshefte für deutnches Unterricht; JEGP—Journal of English and German Philology.*

While The American Year Book is not the place for contributions to our science, the author of this report can not refrain from a brief comment reflecting personal opinion. The exponents of both sides of the controversy are subject to the criticism of not admitting the supplementary nature of both types of approach. Bonfante even goes so far as to deny the fundamental tenet of historical linguistics, namely, the invariability of phonetic law, and claims that the history of every word is an individual one, yet in all his work he tacitly seems to be cognizant of the regularity of phonetic development under given circumstances, and that is all we mean by phonetic law. The reaction of dialect geographers against the stiff-necked intransigence of the older school of neogrammarians is not surprising. The very complexity of the materials with which one deals in the history of modern cultural languages is, of course, to blame, and nowhere is the evidence more complex than in Italian, owing to the many factors obtaining in the development of the Italian language. All of which, however, does not refute phonetic law, but rather indicates our ignorance of, and inability to analyze, all these factors.

CONTRIBUTIONS TO THE DESCRIPTIVE METHOD

Contributions to the descriptive method are those by Z. S. Harris, "From Morpheme to Utterance" (*Lang.* XXII, 161-183), an attempt to present "a formalized procedure for describing utterances in terms of sequences of morphemes rather than of single morphemes" and by H. M. Hoenigswald, "Sound Change and Linguistic Structure" (*ibid.,* 138-143).

Of significance to the student of Indo-European antiquities and the history of Asiatic cultures is O. Maenchen-Helfen, "Are Chinese *hsi-p'i* and *kuo-lo* IE Loan Words" (*Lang.* XXI, 256-260). The author holds that these terms for "belt-hook" and "belt" are borrowed from the IE base *serp- in words for "scythe, sickle" and *k^wek^wlo- "wheel." The implications in connection with Central Asian studies, in particular Tocharian, may be significant. Though dealing more particularly with Hittite materials, the articles by E. Adelaide Hahn, "The Origin of the Relatives *kwi-, kwo-*" (*Lang.* XXII, 68-85), and by J. A. Kerns and B. Schwartz, "Multiple Stem Conjugation: An Indo-Hittite Isogloss?" (*ibid.,* 57-67) are of interest to the Indo-Europeanist in general. The former examines the evidence in the development of the relative from the indefinite pronominal stem; the latter attempts to evaluate the results of a comparison of verbal stem formations in IE proper and Hittite in relation to the Indo-Hittite hypothesis.

Leonard Bloomfield, "Twenty-one Years of the Linguistic Society" (*Lang.* XXII, 1-3), reviews briefly, at the event of the majority of the Linguistic Society of America, the state of affairs which led to the foundation of the Society in 1925, its major achievements and the general problems still facing it. The most important, and the most difficult, task is yet before the American linguist: The promotion of knowledge of linguistic science beyond the immediate circle of specialists. The contribution of the Linguistic Society through its organ, *Language,* to the technical advancement of the science is amply attested to by the frequent reference to that journal in this report in THE AMERICAN YEAR BOOK from year to year.

An echo of the war activities of the Intensive Language Program of the American Council of Learned Societies (cf. THE AMERICAN YEAR BOOK, 1943, p. 900 f., 1944, p. 928 f.) is found in the report of a "Symposium on Intensive Civilian Courses in German" (*Germ. Quart.* no. 1, vol. XIX, Jan. 1946).

INDO-IRANIAN

Sanskrit.—The American Oriental Society has published F. Edgerton's *Sanskrit Historical Phonology* as a Supplement to *JAOS* (no. 5, Jan.-Mar. 1946). Mimeographed copies of the work had been circulated earlier by Professor Edgerton to his colleagues and had already seen good service in Sanskrit classes in America. The printed edition is welcome to all Indo-Europeanists whether or not teachers of Sanskrit. It is a handy elementary introduction for the use of beginning students and will prove a great time-saver for class use. Thumb's *Handbuch* is long out of date and unavailable, and the great Wackernagel, still incomplete, of course, is an impossible book for beginners. Edgerton has done a great service. Other contributions of the same scholar are: "Meter, Phonology and Orthography in Buddhist Hybrid Sanskrit" (*JAOS* LXVI, 197-206), "Indic Causatives in *-āpayati* (*-āpeti, -āvei*)" (*Lang.* XXII, 94-101), and "Sir William Jones: 1746-1794" (*JAOS* LXVI, 230-239). The first two are outgrowths of Edgerton's life work, the grammar and lexicography of Buddhist Sanskrit; the last is a memorial sketch of the life of the founder of Indic philology and formulator of the fundamental postulate of comparative grammar concerning the relationship of languages of observed regular similarity. In "The Nasal Phonemes of Sanskrit" (*Lang.* XXII, 86-93), M. B. Emeneau applies modern techniques to determine the phonemic character of the Sanskrit nasals. P. Tedesco, "Sanskrit *bāṣpa-* 'tears'" (*ibid.,* 184-193), concludes the form to be Middle Indic for Old Indic **varṣman-*.

Old Persian.—Prof. R. G. Kent has continued his fruitful researches with three contributions: "Old Persian *artācā brazmaniya*" (*Lang.* 21. 223-229), "The Accusative in Old Persian *mām kāma*" (*JAOS* LXVI, 44-49), both new interpretation of two old cruxes, and "The Oldest Old Persian Inscription" (*ibid.,* 206-212), in which he concludes in favor of the argument for a later date for the inscriptions in question than that assumed by some scholars.

GREEK AND LATIN

Greek.—The dean of American Greek dialect scholars, Prof. C. D. Buck has published a summary of information turned up by the Italian excavations on "The Dialect of Cyrene" (*Cl. P.* XLI, 129-134), and, in Homeric studies, G. M. Bolling, "Dative Plurals of the *o-* and the *ā*-stems in Homer" (*Lang.* XXI, 261-264), claims that the types ’Αχαιοις, Θεης are originally sandhi-variants of the type in *-οισι, -ησι*, not original instrumentals. R. L. Ward in "Loss of Final Consonants in Greek" (*Lang.* XXII, 102-108), illustrates the trend toward the reduction of permitted final consonants in the history of the language from Indo-European to modern times.

Latin.—F. Metzger has given a study in Latin and Indo-European word-formation "Latin *-idus* and *-tūdō*" (*Lang.* XXII, 194-199), and Miss E. A. Claflin in "The Middle Voice in the *De Senectute*" (*AJP.* LXVII, 193-221), has attempted to show middle uses of the passive in idiomatic Latin prose. R. A. Hall's article "Classical Latin Noun Inflection" (*Cl. P.* XLI, 84-90), tentatively outlines a "descriptive" analysis of the Latin declension as opposed to the analysis of traditional grammar.

GERMANIC

Prof. Otto Springer has profited from his stay in Germany in government service in two reports to his colleagues: "Germanic Studies in Germany during the War" (*MDU* XXXVIII, 177-186), containing much information of men and projects, and "Germanic Bibliography 1940-45" (*JEGP*. XLV, 251-326). Incomplete and uncritical as this latter is, it is nevertheless welcome also to the Indo-Europeanist. R. A. Fowkes, "Germanic _*harta_ 'Resin, Pitch'" (*JEGPh*. XLV, 218-219) connects the Germanic words to the IE base _*(s)ker-_ "separate, divide" (by way of "excretion"). W. M. Austin in "A Corollary to the 'Germanic Verschärfung'" (*Lang*. XXII, 109-111), attempts to show that the velars in OE *cwicu*, etc., and OHG *franco*, beside Lat. *vīvus* and Skt. *priya-* result from Indo-Hittite laryngeal plus *w* and *y*.

In Norse, Prof. A. M. Sturtevant has continued his gleanings in unsolved problems of grammar and lexicography: "Semantic Notes on the Elder Edda" (*Scand. Stud*. XIX, 1-18), "Irregularities in the Old Norse Substantive Declension" (*ibid*., 79-88), and "Notes on Certain Old Norse Analogical Forms" (*MLN* LXI, 57-60).

While the publication of textbooks in modern languages is normally of insufficient significance to warrant mention in this report, yet Stefán Einarsson's book *Icelandic: Grammar, Texts, Glossary* (Baltimore, 1945), because of the rarity of the occasion and the importance of Icelandic to the Germanist, merits generous consideration. Here at last is a competent means of approach to the study of that most archaic living Germanic dialect. Reviews are R. Beck (*MLN* LXI, 200-202), L. Hollander (*Scand. Stud*. XIX, 42-44), and G. S. Lane (*Lang*. XXII, 249-259).

For West Germanic in general there is W. H. Bennett's study "The Cause of the West Germanic Consonant Lengthening" (*Lang*. XXII, 14-18), which holds that the immediate cause was the "development of new vowels, which came about through the vocalization of *j* and *w* and through the generation of vowels in conjunction with liquids and nasals." In Old English, J. W. Watson, "Northumbrian Old English *ēo* and *ēa*" (*Lang*. XXII, 19-26), attempts to show the dialectal "phonemic coalescence in an ǣ-diphthong."

ARMENIAN

G. Bonfante in "Armenian and Phrygian" (*Armenian Quarterly* I, 82-97), reviews the linguistic evidence for connection of the two ethnic groups. Also to be welcomed is the appearance of a new journal dedicated to serious research in a much neglected field.

SLAVIC

C. T. Hodge attempts a new phonemic analysis with particular attention to affricates and palatals in "Serbo-Croatian Phonemes" (*Lang*. XXII, 112-120).

CELTIC

J. J. Parry gives a survey of the Cornish language movement since the publication of Jenner's *Handbook* (1904) in "The Revival of Cornish: An Dasserghyans Kernewek" (*PMLA* LXI, 258-268).

DIVISION XXVI

THE ARTS

ARCHAEOLOGY

By JOTHAM JOHNSON
ASSISTANT PROFESSOR, NEW YORK UNIVERSITY

GENERAL

Archaeological studies as a whole in 1946 were still far below normal peacetime levels. The special talents which made field archaeologists useful to their country in the war were also in demand after the end of fighting, and such figures as Carl W. Blegen of the University of Cincinnati, C. B. Welles of Yale, John F. Daniel of the Pennsylvania Museum, Laurance P. Roberts of the Brooklyn Museum, and Charles R. Morey of Princeton were not released to civilian pursuits until late in 1946 or were still in government service. Many others, who had already returned to campus or museum, found it desirable to brush up their educational practice, refresh their classroom material, catch up on four years' back reading, and consolidate their social ties before striking off into new ventures.

As in other fields, many persons who would have retired between 1941 and 1945 had made their contribution to the war effort by remaining in office; these now found it possible to step aside, and the appearance of new, youthful faces in positions of professional responsibility was a novel aspect of 1946.

ARCHAEOLOGICAL INSTITUTE ACTIVITIES

Organization.—The Archaeological Institute of America has, since its founding in 1878, acted as a central clearing-house for archaeologists of the United States and Canada. In 1946 the Institute had a new president, Sterling Dow of Harvard, and a new General Secretary, Stephen B. Luce of the Rhode Island School of Design. The official technical journal of the Institute, the *American Journal of Archaeology,* has a new editor, John F. Daniel of the University of Pennsylvania Museum.

American School of Classical Studies at Athens.—The Institute rarely participates directly in field excavations, which are considered to be essential functions of the daughter schools, six in number. The American School of Classical Studies at Athens, Greece, under the acting directorship of Gorham P. Stevens, has resumed partial operation; the new director, Rhys Carpenter of Bryn Mawr College, will take up residence in September, 1947. The School's excavations are both major exploration and research projects and training-grounds in field methods for students of archaeology. In 1946, two notable excavations were resumed, those of the Agora at Athens, under a new field director, Homer A. Thompson of the Institute of Advanced Study, and of Corinth, directed by Oscar Broneer; but a Greek government restriction on the number of workmen employed (20 in the Agora, 10 elsewhere) meant that little more than cleaning and repairs could be undertaken.

Classical School of the American Academy in Rome.—Thanks to a pre-war policy of the Italian Department of Antiquities, students of the

Classical School of the American Academy in Rome had infrequent opportunities to take part in actual field excavations, and their studies were principally concerned with the re-evaluation of discoveries previously made and reported by Italian excavators. It appears that this situation is now to be corrected; the Academy hopes to be granted a concession to excavate a major site, so that students of classical archaeology as well as of architecture may look forward to field training and to working with fresh artifacts. The Academy itself has a new director, Laurance P. Roberts, formerly of the Brooklyn Museum, and Frank E. Brown of Yale University has been named professor in charge of the Classical School and director of excavations. Dr. Brown, at present Director of Antiquities for the Syrian government, is to be released from his present duties in time to arrive in Rome before Oct. 1, 1947.

American School of Oriental Research at Jerusalem.—The American Schools of Oriental Research are based on the school in Jerusalem, currently under the directorship of Nelson Glueck of Hebrew Union College, Cincinnati. With faculty and several fellows in residence, the Jerusalem school is back in nearly normal operation, but the present program of the school envisages field exploration rather than actual excavation under present political conditions. For the term beginning in September 1947, Millar Burrows of Yale has been elected director. When conditions permit, the Jerusalem school has an offshoot in the American School of Oriental Research at Baghdad, Iraq. This school did not resume operation in 1946; but S. N. Kramer of the University of Pennsylvania Museum, as annual professor of that school, has taken his station in Constantinople, where he is copying cuneiform literary texts deposited there.

The American School of Prehistoric Research, whose director is Hugh Hencken of the Peabody Museum, Harvard University, has also been gathering its forces in 1946. The school has plans for a summer session in France in 1947, and for an expedition to excavate the Caves of Hercules near Tangier in Morocco, where palaeolithic and neolithic materials have already been found. The school is also publishing a monograph, now in press, on "The Neolithic Period in Bulgaria," by the late James Harvey Gaul, a former student, who, while serving with the Office of Strategic Services in Europe, was captured and illegally executed by the Germans.

The School of American Research, at Santa Fe, New Mexico, has been adding steadily to its plant and collections and, under the directorship of Edgar L. Hewett, has become the natural focus of American studies in the southwest. Dr. Hewett died on Dec. 31, 1946; Paul A. F. Walter, vice-president and treasurer of the school's Managing Board, and treasurer of the Board of Regents of the Museum of New Mexico, is acting in his place until a permanent director is elected.

OTHER ORGANIZATIONS

In other institutions, such as the Oriental Institute at Chicago, Metropolitan Museum of New York, Museum of Fine Arts in Boston, and the University Museum in Philadelphia, which formerly conducted sensationally successful excavations in the Mediterranean and western Asia, the policy in 1946 has similarly been to gather strength and watch for the political situation to clear.

Field exploration outside the United States has suffered from the sustained effort of the Government to depress interest rates, which has halved institutional income from invested funds while drying up private sources which once supported archaeological enterprise. There is no thought of subsidy from public monies, though such funds have been made available for research in the natural sciences. As long as the present situation holds, institutions of the sort here described must, in order merely to hold their ground, depend on multitudes of membership fees and small contributions.

FIELD REPORTS

Among the reports from the field which particularly concerned and interested American archaeologists in 1946 are (1) the return, from Java and Japanese prison camps, of Ralph von Koenigswald, with fossils of three human or humanoid types, discovered before the war and hidden from the Japanese only by supreme good management and good fortune: Pithecanthropus Erectus, Meganthropus, and Gigantopithecus; von Koenigswald, with the collaboration of Franz Weidenreich, is studying these epochal finds at the American Museum of Natural History, New York; (2) the discovery, in the port area of Boston, of a very primitive Indian fishing-village; (3) the discovery, in Mexico, of five colossal portrait heads of Indians, each nearly ten feet high and weighing 20 tons, dating from the time of Christ, similar to six previously found; (4) reports from the former mosque, former Byzantine church of Santa Sophia in Constantinople, where Thomas Whittemore of Harvard continued throughout the war his work of uncovering the fabulous mosaics; in 1946 he bared new figures quite the equals of the best found earlier; (5) the discovery, by W. D. Strong of Columbia University, at a Mochica (pre-Inca, c. 1000 A.D.) site in the Viru Valley of Peru, of a sensational ritual burial of an old man, two women and a boy, associated with figures of the god Aiapaec, for whom the old man had probably been high priest. This expedition is integrated with the program of the Institute of Andaean Research, in which Columbia University, American Museum of Natural History, Chicago Museum of Natural History, Yale University, and the Smithsonian Institution are cooperating with Peruvian authorities; (6) the discovery, by W. A. Ritchie of the Rochester Museum of Arts and Sciences, near the Seneca river in central New York, of an Owasco (pre-Iroquois, c. 1250-1300 A.D.) site, with extensive pottery deposits; (7) the collapse of the much publicized Tranquillity (California) burials, where fossilized human bones found in proximity to a bone of an extinct cameloid, raising the presumption of relatively great antiquity, appeared on meticulous examination to be quite modern.

PUBLICATIONS

Printing is still a difficult factor, but the appearance of several important works in 1946 gave promise of more to come: Frank C. Hibben, *The Lost Americans* (Crowell), William S. Smith, *Ancient Egypt* (Museum of Fine Arts, Boston), Rhys Carpenter, *Folklore, Fiction and Saga in the Homeric Epics* (Univ. of California Press), Nelson Glueck, *The River Jordan* (Westminster), David M. Robinson, *Excavations at Olynthus, Part 12, Domestic and Public Architecture* (Johns Hopkins Press), George Hoyningen-Huene and David M. Robinson, *Baalbek Palmyra* (photographs and descriptive text, Augustin, New York), Preliminary Report of the Excavations at Dura-Europos, Volume IX, Part 2, *The Necropolis* (Yale Univ. Press), Sylvanus Griswold Morley, *The Ancient Maya* (Stanford Univ. Press) *Dumbarton Oaks Papers,* Volume III (Harvard Univ. Press), George Hoyningen-Huene and Alfonso Reyes, *Mexican Heritage* (photographs and commentary, Augustin, New York), and Edgar L. Hewett, *Two Score Years* (Univ. of New Mexico Press). In addition, other manuscripts have been completed and delivered to the press, and should appear in 1947: Volume II of the *Excavations at Tarsus* series, by Hetty Goldman and others (Princeton Univ. Press), two fascicles of the *Corpus Vasorum Antiquorum* (Harvard Univ. Press), A. E. Raubitschek's *Dedications from the Athenian Acropolis,* L. E. Lord's *History of the American School of Classical Studies at Athens* (Harvard Univ. Press), and P. V. C. Baur's Final Report of the Excavations at Dura-Europos, Volume IV, Part 3, *Lamps* (Yale Univ. Press).

Elsewhere the recession of military preoccupations has provided an opportunity to complete the preparation of official reports of excavations made prior to 1939: the Athenian Agora, the North Slope of the (Athenian) Acropolis, Persepolis, Troy, Pylos, Olynthus, Corinth, Antioch, Dura-Europos, Nessana, Piedras Negras, and many others. Following the First World War, it was about five years before field work could be resumed in comfort and relative security; if this situation is to obtain again, the subsequent flood of considered publications will have beneficial effects throughout the whole field of ancient studies.

PAINTING

By Florence S. Berryman
The American Federation of Arts

GENERAL

The first full post-war year accelerated normal activities and developments in the field of painting and witnessed a sharp decline in wartime aspects, surprising only because of its suddenness. Young artists, fresh from the armed forces, found little or no interest in their painted impressions, in marked contrast to the public's response to combat art during the previous year.

In Europe, the U. S. Army continued to cope effectively with displaced art treasures. The 202 masterpieces belonging to German museums, sent to the United States in December, 1945, caused a major art controversy in 1946. However, other international tours of collections of paintings were given much impetus by the U. S. Department of State, and enjoyed happier receptions.

Outstanding masterpieces entered American collections, led by the third magnificent Kress gift to the National Gallery of Art. Patronage of art by industry increased in degree, and some new business firms entered the field. Auction prices for paintings soared far beyond the previous inflationary season.

ARMY-SPONSORED EXHIBITIONS IN GERMANY

Superb exhibitions of salvaged treasures were held in the museum at Wiesbaden in the American Occupational Zone of Germany, under auspices of the monuments and fine arts division of the American Military Government. The first, February through April, comprised Italian old masters from the Berlin and Frankfort collections. Of 63,000 persons who paid admission to see it, only a few were G. I.'s, whose indifference to the opportunity saddened the authorities.

The second show opened May 13 for the summer: "Northern Art before 1600" including famous German and Flemish paintings, and Egyptian sculpture, drawn mainly from the Kaiser Friedrich Museum, Frankfort, Darmstadt, and Cologne galleries collections, recovered from salt mines and comparable places. The sculptured bust of Queen Nefertiti was the outstanding exhibit. More than 1,000 people daily paid admission. American military and German civilian guards were on duty 24 hours a day. German art experts assisted in the care of the paintings.

CONTROVERSY OVER GERMAN MASTERPIECES

The old master paintings, including some of the world's greatest, brought over and stored in the National Gallery's vaults "for safe keeping until conditions in Germany insuring their proper care have been reestablished," set off the year's chief art furore. Press releases from the White House and State Department convinced the average person that these treasures from the Kaiser Friedrich and other German museums were in no sense war loot.

However, the February issue of the *Magazine of Art,* official organ of The American Federation of Arts, contained strong protests from American museum officials and other art leaders against the transfer, as morally untenable, establishing dangerous precedents, etc. In May, a committee of nearly 100 art leaders sent to President Truman a signed resolution demanding immediate return of the German masterpieces, comparing United States action to Nazis' "protective custody." The committee was publicly reproved by former Justice Owen J. Roberts, chairman of the American Commission for the Protection and Salvage of Artistic and Historic Monuments in Europe, in a press statement saying in effect that the Commission trusted the United States Government to keep its word, and that the resolution had no justification. Still other groups, among them the American Artists Professional League, pleaded with the Government for public exhibition of the paintings, suggesting admission charge, with proceeds to go for German aid. At least one reason why they were not shown during 1946 is that they came to this country minus their frames.

STATE DEPARTMENT ART TOURS

The State Department entered the touring-art-exhibition field in a big way, in response to requests from many places, for exhibitions of American art. Some of its projects are composed of outright acquisitions of contemporary art, in charge of J. Leroy Davidson, while others are organized by institutions and experts at the invitation and under the sponsorship of the State Department.

Among the shows assembled by Mr. Davidson were four exhibitions of original prints bought and sent to South America. Two collections of oil paintings, entitled "Advancing American Art," one comprising 49 to be shown in the Eastern Hemisphere, the other of 30 for exhibition in Latin America, were displayed at the Metropolitan Museum, New York City, in October, before they embarked on travels to last for five years. The State Department finds that buying works outright is less expensive than renting them for so long a period.

As a one-man jury, Mr. Davidson has chosen paintings and prints of an esthetically radical character, hence his traveling shows are "leftist" rather than cross sections. This brought protests to the State Department from such conservative art groups as The American Artists Professional League, The National Academy, The Salmagundi Club of New York, The Society of Illustrators, and The Allied Artists, who considered the touring shows "one-sided."

The latest State Department exhibition, a loan of 60 paintings from International Business Machines' collection, selected by Mr. Davidson, sailed the end of the year for Cairo, Egypt, where it opened under sponsorship of King Farouk, in January, 1947. Thence it will go to Italy, and will tour Europe as "American Industry Sponsors Art." It ranges from Samuel F. B. Morse to Karl Zerbe.

BRITISH AND AMERICAN EXCHANGES

The United States' outstanding art export in 1946 was the collection of more than 200 oil paintings and watercolors by 106 artists, providing a panorama of American art from Colonial times to the present. In 1945, the State Department received a request for such a loan, from the Tate Gallery, London, which bore all expenses of the show outside of our country. The National Gallery of Art organized it, with selections made by twin juries of outstanding American museum officials. The exhibition was opened in June by British royalty and the U. S. Ambassador, and remained on view six weeks. The majority of English critics were not favorably impressed with it.

Great Britain sent to two American museums, 62 paintings by three of her greatest masters: Hogarth, Constable, and Turner, valued at $7,000,000. This loan exhibition opened Oct. 15 at The Art Institute of Chicago for two months, whence it went to the Metropolitan Museum, New York City for showing Jan. 24-March

16, 1947. These loans from the British Government, leading museums, and King George VI and other private owners, required an act of Parliament; the majority of the works had not previously left England, none had crossed the Atlantic.

LATIN AMERICAN EXCHANGE

"Watercolors, U. S. A." also organized by the National Gallery, was assembled by Walker Art Center, Minneapolis, for a six-months tour of Latin America. It illustrated important trends in the medium during the half century between Homer and Morris Graves. The paintings, borrowed from leading museum collections, were protected by a novel method of framing in air-sealed plexiglass.

The Art Section of the Council for Inter-American Cooperation, sponsored by the State Department. brought two exhibitions to tour the United States: 60 paintings by six Latin Americans, and paintings and drawings by nine young Mexicans. The Section also started a third show, work by a Bolivian artist Antonio Sotomayor, who has lived in San Francisco for 20 years.

NETHERLANDS APPRECIATION

The government of The Netherlands sent to the United States for a one-year tour, 48 masterpieces of Dutch painting of the 16th and 17th centuries, valued at $1,000,000 as a gesture of appreciation for the much larger quantity of art looted from Holland by the Nazis, and returned through the efforts of the U. S. armed forces. The exhibition opened at the National Gallery of Art in December; during 1947 it will visit 14 museums and art galleries, with which are connected men of our Monuments, Fine Arts and Archives Section who were responsible for the restoration of Holland's stolen treasures.

INDUSTRY'S PATRONAGE OF ART

Pepsi-Cola Company's third annual competition "Paintings of the Year" was truly a national affair, owing to the new regional jury system inaugurated by Roland McKinney, director. The resultant exhibition which opened Sept. 30, filled 10 galleries on four floors of the National Academy, New York. Twenty prizes, totaling $15,250, were awarded: first to Boris Deutsch, $2,500 for his "What Atomic War Will Do to You," a group of tortured, distorted figures; second, $2,000 to Carlos Lopez-Rey; third, $1,500 to Robert Gwathmey; fourth, $1,000 to Abraham Rattner; fifth, $750 to Gregorio Prestopino; and 15 others of $500 each. Pepsi-Cola also awarded fellowships of $1,500 each to seven promising young artists selected from lists submitted by the seven regional juries.

Encyclopaedia Britannica, which intends to augment annually its collection of paintings touring the United States, devised a new plan for the institutions scheduled to display the show which could not handle more than the original 135 paintings. A "rotating annual," emphasizing creative experimentation, inaugurated at the New York Architectural League in October, will join the larger show whenever space permits. *Britannica* rents, with option to buy, 12 to 15 paintings for a year's tour, at $200 each, not deducted if painting is subsequently purchased.

Heller-Deltah Company exhibited in January 1946 at Portraits, Inc. New York City, 50 paintings selected in its theme prize competition, "Woman with Pearls," inaugurated in 1945. Awards, totaling $4,500 in victory bonds, went to Max Weber, $2,000; Lily Cushing, $1,000; Ruth Ray, $750; 10 others, $75. The exhibition began a nationwide tour in February. The 1947 La Tausca competition, announced in 1946, contained important rules changes to provide artists with more financial security. Every painter represented was invited by a jury, and was paid $100 for the exhibition of his work for one year, excepting only those who won the first six prizes, those vhose paintings might be sold, and hose whose paintings were owned by omeone else.

Loew-Lewin Productions held an nternational competition (by invitation only) for a painting of "The Temptation of St. Anthony" to be used in their motion picture "Bel Ami," adapted from De Maupassant's novel. Max Ernst's interpretation won the prize of $3,000 and was used n the film. Each of the other 10 American and European contestants was given $500; all retain ownership of their paintings. The collection, urrealistic in character, opened in New York City in September, the irst place on a national circuit arranged by The American Federation of Arts. The second engagement for the Copley Society, Boston, was cancelled because Mayor James M. Curley denounced the paintings, as "an nsult to the Catholic Church." However, they were shown a month later at the Stuart Art Gallery, Boston.

International Business Machines continued to acquire and exhibit extensively its paintings and other art objects. Its president, Thomas J. Watson, has bought more than 30,000 art items in the past decade, the best of which will be housed in a permanent museum now under construction at Endicott, N. Y.

Standard Oil of New Jersey publicly exhibited for the first time 87 oils, watercolors, and drawings by 16 outstanding contemporary American artists, depicting the development and distribution of oil during the war years. These are only a part of the company's collection, which began several years ago in a modest way, as illustrations for its publication *The Lamp*. A selection was sent on a national circuit by The American Federation of Arts.

Gimbel Stores of Philadelphia and Pittsburgh sponsored a project, directed by Associated American Artists, for a collection which will total 100 oils, watercolors, and drawings of various aspects of contemporary life n Pennsylvania, to be painted by 14 contemporary artists, and sent out on a national circuit. George Biddle and Joe Jones were the first commissioned.

MUSEUM ACQUISITIONS BY GIFT, BEQUEST, AND PURCHASE

The National Gallery of Art exhibited, in February 1946, the most munificent gift to an American museum shown during 1946: 110 recent additions to the Samuel H. Kress collection, the third gift from Mr. Kress. The great majority were Italian Renaissance paintings, 12th through 18th centuries; there were also French paintings of the 17th and 18th centuries; Italian Renaissance, English Gothic, and early German sculpture. The National Gallery received four important paintings by Canaletto, representing the fading splendor of Venice, a gift from Barbara Hutton. Albert Ryder's "Siegfried and the Rhine Maidens," one of his six most important paintings, was purchased for the National Gallery through the Mellon fund.

The Boston Museum of Fine Arts made its most important acquisition in many years: a crucifixion triptych by Duccio di Buoninsegna. Owned and kept in England by J. P. Morgan for 40 years, it is one of only 13 paintings by Duccio outside of Italy, of seven in the United States. "The Artist in His Studio" by Rembrandt was given to the Boston Museum by Mrs. Zoe Oliver Sherman.

The Cincinnati Art Museum received the greatest Christmas gift in its history, when Miss Mary Hanna, on Dec. 12, presented 31 oils and two pastels, representing almost all the oil paintings in the famous Hanna collection, all of its English paintings. The collection is especially strong in Dutch 17th century painting.

Los Angeles County Museum acquired 22 old master paintings, sculptures, and crafts for about $75,000 of the $100,000 given by the William Randolph Hearst Foundation; selections were made by William R. Valentiner to represent periods, artists, or schools lacking or weak in the Museum's permanent collections. Zurburan's "Young Christ in the

Desert" was the outstanding painting of a group, including works by Jordaens, Gerard Dou, and other Dutch and Italians. The Museum opened Oct. 1 an exhibition of Mr. and Mrs. George Gard De Sylva's collection of French art—22 paintings and 10 sculptures dating from the 1860's to the 1920's, eight of which have been given to the Museum, and the remainder promised.

Metropolitan Museum of Art.—Particularly interesting, among many acquisitions by the Metropolitan Museum of Art, New York City, is the superb portrait by Paolo Veronese, of the Venetian sculptor Alessandro Vittoria, holding one of his own statuettes, a version of which belongs to the Metropolitan.

The Art Institute of Chicago acquired, both by gift and purchase, paintings of many schools and periods, from Lucas Cranach the Elder to Yves Tanguy.

The William Rockhill Nelson Gallery, Kansas City, acquired Velasquez's portrait of Mariana, Queen of Spain, a rare example in the United States.

The Toledo Museum of Art acquired from a Dutch collector "Peasants before an Inn" by Jan Steen.

The Minneapolis Institute of Art acquired "Prodigal Son" by David Teniers the Younger, painted about 1640; and received as a gift from the Chester Dale Collection Benjamin West's "Countess of Northampton" (and her daughter) painted 1762.

The Detroit Institute of Arts acquired "The Wilkinson Family," an outstanding painting by Benjamin Wilson, British 18th century.

The Montclair (N. J.) Museum acquired Gilbert Stuart's portrait, painted 1782, of the eminent Caleb Whitefoord, who came to conduct peace negotiations with the American colonies and was a friend of Benjamin Franklin.

The State College of Washington at Pullman received the Virginia and Charles Orton Collection, planned as a gift and developed in the past two years. It now numbers 30 paintings by outstanding Americans, from impressionism to the present, and will be augmented annually.

The Butler Art Institute, Youngstown, Ohio, acquired through gift and purchase 13 paintings by 19th and 20th century Americans, among them Eakins, David Blythe, and Eastman Johnson.

St. Louis City Art Museum acquired one of Winslow Homer's most important early paintings, "The Country School," dated 1871.

The Springfield (Mass.) Museum acquired an outstanding still life by Chardin, "Rafraichissements."

The Whitney-Metropolitan Museum purchases of contemporary art 1943-46 (the four years since the two New York City museums' merger was announced) were shown at the Whitney in September. The Metropolitan purchased 83 oils, sculptures, watercolors, and drawings, while 74 works were purchased by the Whitney. The Museum of Modern Art, New York City, bought in 1946, nine paintings and three sculptures.

The Pennsylvania Academy of Fine Arts, Philadelphia, acquired more than $10,000 worth of contemporary art, mostly oil paintings, from its 141st annual early in the year.

The New Britain (Conn.) Institute purchased 27 oil and watercolor paintings during 1945-46, bringing its permanent collection to about 250 works of 19th and 20th century American art.

FLORIDA WINS RINGLING MUSEUM

Florida obtained the most valuable art possessions owned by any of the states, it is said, when the John and Mabel Ringling Museum of Art was turned over to the state in July, along with the Sarasota home of the late circus magnate, whose death was followed by a decade of legal complications instituted by the Government and other claimants to his property. Old master paintings held by litigation in New York were returned to Sarasota. The museum and the home are valued at about $15,000,000. During the few months before Christmas, half the renovation program was completed, under direction of A. Everett Austin, Jr. Three galleries were open to the public, displaying French, Dutch, and Italian primitive paintings, and Gothic wood sculpture. Venetian paintings were moved to the Ringling residence, which is to be turned into a Venetian museum.

EXHIBITIONS

Exhibitions of high caliber increased in number throughout the country. Their objectives were varied. Besides the many museum shows assembled to enlighten the public, there were exhibitions to raise funds for charities, to celebrate anniversaries, to honor living artists or to commemorate some who had passed, to inaugurate new galleries or buildings, and to fulfill other equally valid purposes.

METROPOLITAN DIAMOND JUBILEE

The Metropolitan Museum of Art, New York City, celebrated its 75th anniversary with the reopening, May 24, 1946, of rearranged medieval galleries, and unveiling by Cardinal Spellman of several famous masterpieces sent over for the occasion by the Vatican, Bargello, and Louvre. The Louvre lent Delacroix' great painting "The Barricade," the first picture to be hung when the Louvre reopened after German occupation, a symbol of French resistance. M. Georges Salles, director of French museums, was present. Another feature of the celebration was an exhibition of paintings and sculpture entitled "Taste of the Seventies," closely hung, as was the custom those days. It included fine old masters, as well as sentimental romantic figures by Bouguereau and his contemporaries, and not a few landscapes.

In conjunction with the Metropolitan's 75th anniversary, Knoedler & Company, New York City, celebrated its centenary with an exhibition of paintings and prints illustrating American taste through the century of Knoedler sales; taste very creditable, although there was a proportion of work once fashionable, by artists now generally unknown. Knoedler & Company had engineered the $12,000,000 purchase from the Soviet Government, of some 30 Hermitage Museum paintings, including gems later given by Andrew Mellon to the National Gallery. From admissions to its centennial exhibition, Knoedler contributed $3,622 to the Metropolitan Museum, which by the end of the year had received $1,053,506 in its jubilee fund drive.

BRITISH MASTERS

The Boston Museum of Fine Arts showed in April 1946 more than 250 paintings, watercolors, and graphic arts by Turner, Constable, and Bonington drawn from all available works throughout the United States and National Gallery of Canada. It was perhaps the greatest English landscape exhibition held in America prior to the loan from Britain in the fall.

The Albany Institute of History and Art opened in January 1946 an historical survey of painting in Canada from the 17th century to the present, including 71 paintings borrowed from Canadian institutions and private collectors. The show's popularity necessitated its extension to mid-March.

FRENCH MASTERS

Wildenstein Galleries, New York City, held outstanding exhibitions of French art: in April, the most comprehensive review of work by Paul Gauguin yet seen in the United States, a loan exhibition for the benefit of the New York Infirmary; in May, "French Paintings of the Time of Louis XIII and XIV" (17th century), one of the most important loan shows of the year, and held for the benefit of Caen Library Fund; and in November, a major display of work by Toulouse-Lautrec, for the benefit of Goddard Neighborhood Center.

Philadelphia Museum held a superlative retrospective exhibition of work by Corot in May and June, covering nearly half a century.

The Toledo Museum and the Art Gallery of Toronto cooperated for more than a year to assemble the outstanding exhibition, "Spirit of Modern France, 1745-1945," 84 works by 54 painters borrowed from more than 30 museums, galleries, and others in the United States, Canada, England, and France. It was shown in Toledo in November and December, in Toronto in January 1947.

The most extensive exhibition of French art was "French Fortnight," part of a campaign to raise funds for "American Aid for France," which began Dec. 26 and continued into January 1947. A panorama of French art occupied seven New York City dealers' galleries: Wildenstein, an admirable group of paintings from 14th through 16th centuries; Knoedler, late 16th century to Cezanne; Paul Rosenberg, an all-loan outstanding show of paintings by Manet; Bignou, paintings by Rouault (disappointing) and Bonnard (excellent); Carroll Carstairs, group of Impressionists and modern French; Durand Ruel, well-selected Renoirs, one of which was sold by its owner to another collector for $125,000, which was given to American Aid for France, which seeks a fund of $2,150,000. Duveen, the 7th gallery, showed French interiors and furniture.

The Santa Barbara Museum of Art celebrated its 5th anniversary in June with an exhibition of paintings, mostly School of Paris, lent by Wright S. Ludington.

The Museum of Modern Art, New York City, having invited seven well-known collectors to lend their favorite pictures for a summer exhibition, revealed that they had marked preference for Europeans, chiefly "School of Paris," and that they had cautiously bought works by well-established contemporaries. Of 59 paintings shown, only five were by Americans, while Picasso alone was represented with five.

OTHER OLD MASTERS

"Caravaggio and the Caravaggisti," an impressive exhibition held at Durlacher Gallery, New York City, early in 1946, illustrated the influence of the Italian master on Spanish, Dutch, Flemish, and French painting.

Forty-three paintings by Rubens and Van Dyck, borrowed from as many sources, were shown at the Los Angeles Museum toward the end of the year, along with a supplementary display of 17th century Dutch, Flemish, and Spanish painting. The Rubens section was said to be the largest collection of his paintings yet shown in this hemisphere.

Rembrandt was impressively represented in an exhibition of Dutch masterpieces at Koetser Gallery, New York City in March.

AMERICAN ONE-MAN SHOWS

Robert Feke, America's first important painter, was given his first one-man exhibition, two centuries after his career in the Colonies. Thirty portraits, nearly half of his known works, were shown at the Whitney Museum, New York City in October, the Heckscher Museum, Huntington, L. I. in November, and Boston Museum of Fine Arts in December, these three museums having collaborated in assembling the collection.

Asher B. Durand.—The 150th anniversary of Asher B. Durand, a pioneer American landscape painter, was celebrated in early autumn with an exhibition at the Harry Shaw Newman Gallery, New York City, which in July had an impressive show of paintings and drawings by Frederic Remington.

George Inness.—A definitive exhibition of 47 oil paintings and many drawings by George Inness, our first great landscape painter, was assembled and held by a trio of museums: the George Walter Vincent Smith Art Museum, Springfield, Mass. to celebrate its 50th anniversary; the Brooklyn Museum; and Montclair N. J. Museum (in his native city), the three displays extending from February to the end of June.

Albert Pinkham Ryder, now regarded as one of this country's three greatest 19th century painters, who never had a one-man show during his life, and very few since, was seen in a small but inclusive exhibition at Macbeth Gallery, New York City in April 1946.

Theodore Robinson, first American Impressionist, was commemorated by the Brooklyn Museum in November, with the first comprehensive exhibition of his paintings, half a century after his death.

George Bellows.—The Art Institute of Chicago had an exhibition early in the year, "George Bellows 20 Years After," 57 paintings and 76 graphic arts, covering his career from college to his death.

William Henry Singer, Pittsburgh painter who lived in Norway 30 years, was commemorated with an exhibition at Milch Galleries, New York City in February 1946.

John Steuart Curry helped to install at the Milwaukee Art Institute. the most comprehensive one-man show of his career, and by his sudden death Aug. 29, six days before the opening, turned it into a memorial which remained until Oct. 15.

Commemorating the late Newell Convers Wyeth was an exhibition held at Portraits Inc., New York, in October and November, of paintings by him and six younger members of his family: son, daughters, and sons-in-law.

Georgia O'Keeffe was the first woman artist to be honored with a solo exhibition at the Museum of Modern Art, New York, in May: 57 paintings ranging from 1916 to 1945.

Philip Evergood was given a large two-decade retrospective at A. C. A. Gallery, New York in April, so varied that it resembled a group show.

Boardman Robinson had a retrospective exhibition at Kraushaar Galleries, New York, covering not only his painting, but his earlier newspaper and magazine work.

E. Barnard Lintott, English-born artist, had a loan exhibition of more than 70 of his paintings covering a quarter century, at French & Company, New York, in October.

Marc Chagall, Russian-born artist, was given a retrospective exhibition at the Museum of Modern Art in April, covering more than four decades of his painting.

THEME SHOWS

Modern religious paintings shown at Durand Ruel Galleries, New York, in January, for the benefit of Grosvenor Neighborhood House, included works by such extreme modernists as Picasso, Rouault, Weber, and Dali.

"The Nude in Art" interpreted in paintings and drawings by old and modern masters, at Wadsworth Atheneum, Hartford, Conn. in January 1946, had important loans from other museums.

Portraits of illustrious members of the Lee family of Virginia, from Richard, who came to America in 1641, through subsequent generations, comprised an unusual loan exhibition at Knoedler Galleries, New York, for the benefit of the Robert E. Lee Memorial Foundation, in April. It maintains the ancestral mansion, Stratford Hall, as a national monument.

"Forty American Paintings, Colonial to Modern Times," a loan show selected from lists by 15 prominent museum directors, artists, and critics, inaugurated the new home of the Akron (Ohio) Art Institute in December, 1945. Albert P. Ryder was the only artist named by all 15.

Addison Gallery of American Art, Phillips Academy, Andover, assembled for autumn, 71 prize-winning paintings from 29 American exhibitions, 1945-46, with the objective of "analyzing and drawing some conclusions" on the jury systems of bestowing awards.

AMERICAN GROUP SHOWS

Modern Group.—Modernism dominated most of the important annuals and other group shows. It was apparent in a show of "Museums' Choice" of contemporary American paintings, held in February 1946 at the R. I. School of Design Museum of Art; it comprised three paintings from each of 17 leading museums.

The Whitney Museum of American Art, New York, assembled an exhibition of "Pioneers of Modern

Art in America," composed of several hundred works, mostly paintings by 34 artists, chiefly of the period 1910-18, who were influenced chiefly by Paris early in the century.

The annual "Iowa Summer Show" at State University indicated a rapid evolution toward modernism in the past year.

Pennsylvania Academy Annual.—The 141st annual of painting and sculpture at the Pennsylvania Academy of Fine Arts, although announced as a "return to the open jury system," was largely invited. The jury of modern artists selected a predominantly modern show.

The 5th Virginia Biennial in Richmond in spring, half invited, half juried, was markedly left of center.

The Art Institute of Chicago held the golden jubilee exhibition of "Artists of Chicago and Vicinity" in April; prizes totaling $3,475 were awarded to 16 artists. During the summer, the Institute held its 57th Annual American Exhibition, supplemented with three one-man feature shows by Jacob Lawrence, Alexander Calder and Karl Zerbe, all moderns.

Carnegie Institute, Pittsburgh.—Modernists took most of the prizes in "Painting in the U. S. 1946" the annual founders day show of Carnegie Institute, Pittsburgh, which was nevertheless a well-balanced exhibition with its proportionate share of conservatives.

The High Museum of Art, Atlanta, Georgia, inaugurated a Southeastern Annual of oil and watercolor paintings in October, and drew 700 entries from eight states.

Audubon Artists Group, New York, which in its five years of existence has become one of the largest art organizations in the United States, opened its 5th annual Nov. 24 in seven locations: the American Academy of Arts and Letters, and six 57th street dealers' galleries. It totaled 594 oil and watercolor paintings, and work in other media.

Whitney Museum's 1946 annual of contemporary American painting was markedly radical in character, including expressionism, abstraction, surrealism, romanticism, and fantasy.

VARIA

The late Louis Comfort Tiffany's 50-room Moorish mansion, Laurelton Hall, Cold Springs, L. I., which with 60 acres of woodland, gardens, lakes, recreation areas, and other buildings was a part of the Tiffany Foundation, where about 50 painters and other artists were guests each summer during the past quarter century, was sold at auction in September, ending the Foundation in its familiar form. Proceeds from the auction and earlier bequests are to be invested and income used for grants of cash to art students.

An innovation was announced in December, by Michael M. Nisselson, president of Amalgamated Bank of New York, *i.e.,* that it would finance the purchase of works of art by living American artists by any responsible person. The bank pays the full amount for the purchase and retains title to the work of art, until full repayment is made by the purchaser, who may have 18 months at 4 per cent interest, and gets immediate possession of the work.

AUCTION RECORDS

Public auction sales of art reflected the trend in prices throughout the country. According to the annual report of the Parke-Bernet Galleries, Inc. of New York, its 1945-6 sales of art and other personal property closed June 14 with an all-time record total of $6,684,045, accompanied by a steadily continuing rise in prices. Annually, for several years, this long-established auction house has broken its own previous records. During 1945-6, 20 per cent fewer lots were sold to a larger number of buyers, whose competition raised prices paid.

Ninety-eight sales were held at Parke-Bernet Galleries from September, 1945 to June 14, 1946. Paintings accounted for $1,210,216 of the total. Highest totals and most sensational prices for paintings were made by the Willys collection itemized in THE AMERICAN YEAR BOOK for 1945; 25

modern paintings from the collection of the late Sir William Van Horne, K.C.M.G., which fetched $221,500. (The National Gallery acquired from this sale, Ryder's "Siegfried" for $23,500.)

Besides the Willys items mentioned in The American Year Book for 1945, the following brought more than $20,000 each: Toulouse-Lautrec's "La Buveuse," $30,000; and his "Femme Rousse Assise Dans le Jardin de M. Forest," $27,500; Cezanne's "Portrait of the Artist's Wife," $24,500; and Bellini's "Madonna and Child," $21,000.

SCULPTURE

By Rose V. S. Berry
Art Critic and Writer

GENERAL

Sculpture has always been more readily understood than the other arts. It possesses a completeness, a nothing-left-unsaid quality in a statue, that not even the printed page can present with such satisfying brevity, and with its personal element, its subject matter taken from the life of mankind, from its beginning it has been impressive and convincing.

Art traditions of western nations were different. They sprang from the Greeks, who carved their religion, their philosophy, and life-story in marble. They assigned the attributes of man and nature to their statues, and a noncommittal remoteness to their gods. Austere dignity characterized Zeus. Knowledge was ascribed to Athena, or Minerva. Melancholy tenderness marks Demeter. Hermes, or Mercury, was lithe and prompt. Vulcan forged lightning and thunderbolts. Pluto ruled Hades. Ares was the god of war. Nike was the goddess of victory.

It was Danté, whom Carlyle called the "voice of ten silent centuries," who dispersed the pall of silence that enveloped Europe. The Divine Comedy—Hell, Purgatory, and Paradise of human experience, and the source for some of the greatest sculpture—gave to Italy its well formed language, making it the seat of Renaissance learning. Then, too, there was that superb organization, the Church, which has endured through the Dark Ages. The era of cathedral building added greatly to the religious element of sculpture when the subject matter began to include the Virgin, the Christ Child, the missions of Christ and his crucifixion, the Apostles, Saints, and great Church dignitaries. In addition there were the heavenly hosts and those of the condemned—the patriarchs, the angels, and the spirits of evil.

The Crusades; the fall of Constantinople which gave to the world many original Greek manuscripts; the discovery of gunpowder, better understanding of the compass, the invention of printing and the discovery of a New World, were all instrumental in the revival of learning which became a rebirth of Greek hellenism, with sculpture playing its part—actually being carried from Greece in ships. These happenings continued through the Renaissance which led into the Reformation, and the Reformation which terminated in Revolution, and the Revolution which in these last years has become world-wide, and in which current sculpture speaks. The record of 1946 supports this statement.

Today's sculptors flaunt defiance of restricting commands. In their art they tell of the world, what is in it, over it, and underneath. They portray man, his life and hazards. They toy with birds, reptiles, animals, plants, and trees. Moreover they carve, model, chisel, and weld from any medium they choose.

EXHIBITIONS

General.—Exhibitions listed in January 1946 numbered 143. Eight included sculpture, and five of the eight were in New York. In April, the height of the art season, 175 exhibitions were held, 20 of these including sculpture. Of the 42 which were given in New York, only four displayed sculpture.

Six Centuries of Painting and Sculpture.—A goodly display of sculpture was included in Six Centuries of Painting and Sculpture, exhibited by the Drey Galleries in New York. Such collections are of importance to all American observers. Regardless of today's revolutionary attitude toward Renaissance art, it was Ghiberti, Donatello, Verocchio, and Michelangelo, who charted the course of sculpture for all time, and their work has survived the criticism of centuries. In one way or another they touched all the problems: That of forsaking Ghiberti's bronze pictures with their atmospheric perspective; movement in sculpture; the power and weakness of detail; and to what extent homely truth should combat mere prettiness.

The National Gallery of Art featured sculpture in its opening of several new rooms.

Baltimore Museum of Art exhibited selected pieces of sculpture from the Modern Museum, New York.

Contemporary sculpture was shown in the Yale University Art Gallery, New Haven, Conn.

The Art Museum of St. Louis, presented a comprehensive study of modern sculpture and its origins.

The Corcoran Gallery, Washington, D. C. included many fascinating small bronzes in its exhibition of American Miniatures.

Ecclesiastic and Modern.—An unusual exhibition was given at the Palace of the Legion of Honor, in San Francisco, when older and more conservative examples of ecclesiastic sculpture were compared with modern compositions. The simplified stylistic treatment by modernists was surprisingly effective, religious and emotional without being sensational.

The Art Alliance of Philadelphia exhibited the contemporary sculpture of Pennsylvania's Guild Craftsmen.

College Student Work.—Pomona College and Mills College, both of California; Holyoke College of Massachusetts; and Swarthmore College, of Pennsylvania, included sculpture in their exhibitions of student work, which they held for their alumnae.

Newark Art Museum exhibited a large collection of sculpture, showing the change of taste in the passing years.

ONE MAN SHOWS

These included an exhibition of Madeline Park's sculpture in Massillon, O.; Harvey Park's sculpture at Woodstock, N. Y.; Leonard Schwart's work in Oberlin, O.; Alonso Hauser's collection at Minneapolis, Minn.; Joseph Larocque, at the Argent Gallery, in New York City. The aluminum sculpture of Mrs. Anna Hyatt Huntington was shown at Green Bay, Wis.; at the same time her small bronzes were exhibited at the Brooks Memorial Museum, Memphis, Tenn.

Other one man shows included an exhibition by Nat Warner, whose work has not been seen in seven years, and the naturalistic and abstract subjects of Glen Luz which were highly decorative. Henry Schonbauer's work dealt mostly with motherhood; however, a head of Beethoven in Honduras mahogany was his most outstanding piece. Charles Umlauf, well known in Texas and throughout the southwestern states, received New York's praise for his work in wood and stone. Harry Rosen's children portraits achieved youthfulness regardless of medium. José de Creeft presented his Pre-Phidian subjects in native stone, serpentine and white marble, onyx, obsidian, and Belgian granite.

The Brooklyn-born Charles Salerno made a first showing with 26 pieces, setting forth the grief and misery war had caused women. He achieved his purpose without sentimental weakness.

DONALD HORD

Donald Hord, of Santa Barbara, Calif., seldom misses giving his admirers something to remember. This year it was the Head of a Negro Girl cut in bluish-black obsidian—really volcanic glass. Broad treatment increased the sadness and racial beauty of massive features, a beauty that will remain timeless and monumental. Hord has rapidly accumulated honors. In 1941, he made the National Sculpture Society; in 1942, the American Academy of Arts and Letters; in 1943, the National Academy; and in 1945, he was appointed to a Guggenheim Fellowship.

DAVID SMITH

David Smith's one man show was assembled from ten previous exhibitions. He is as yet a specialist in his line; he has originated a style. With a welding torch, press, lathe, and drill, he makes steel his medium. Some years ago he attracted attention with his abstractions, described as "space-enclosing" rather than form expressed in volume. His recent work, however, is in no sense abstract. The theme is of current events clearly, even brutally expressed. From a series of medals of *Dis*honor, which were inspired by Medals of Honor that he saw in the British Museum, one, though made in 1937, is notable and of the moment. "Civilian Bombing," it is called. Houses are rocking and crumbling at the horizon line. In the foreground, a tall, unsupported expectant mother stands in agony. Flesh has been torn from her legs. The abdomen, ripped open into a five-point star, is the Caesarean setting for an unborn child. In a baby's high chair, at the mother's right, sits an upright bomb; significant of a lost generation, a child is impaled on the point of a bomb at the mother's left; this is inscribed with significant Greek letters. Storks flying about the mother's head and dropping bombs instead of babies make the final note of surrealism.

The "Rape," based upon war and modeled upon the classical "Leda and Swan" motif, is utterly repellent. It is not the mortal Leda giving herself to a beloved and irresistible god; it is a wretched, spent, reclining, unresisting Leda, yielding to masculine force portrayed in a clumsy cannon. "False Peace" is a startling conception as a bird that never was. Many of its feathers end in thorny tips. Its half-spread wings are barbed with bombs and rockets. Its long, outstretched neck ends in an angular head, while the beak in a murderous pincer-hold ends the life of the Dove of Peace. On one triangular-shaped club-foot the bird stands, displaying in the other foot which is uplifted the trophies of war that have been offered in false hope, to a False Peace. If one would forget war with David Smith they must turn to his "Cock-Fight," which he has achieved with superb tenseness.

ASSOCIATION AND SOCIETY EXHIBITIONS

The New York Society of Women Artists included some notable work by eight sculptors. Among them were Doris Caesar, Kermah Kallman, Clara Shainess, Mitzi Solomon, and Beatrice Stone.

The National Society of Women Painters and Sculptors had a sculpture section that was consistently good. The National Medal was given to the Latin-American Marie Del Prado, for her "Miners" carved in wood. The first cash prize was awarded Grace Turnbull, for a huge hippo head titled "Gracious Countenance." The second cash prize went to Ruth Nickerson, for a Child Head, a study in marble. An anonymous prize was given Katherine Lane for a tender, but capable "Sleeping Foal." A "Memorial," by Mitzi Solomon; "Animal Studies," by Rhys Caparn; a "Head," by Cleo Hartwig; and two figures of strange Mexican mystics, "The Penetente" and "Los Flagalantes," by Lu Duble, were outstanding.

The Whitney Annual featured the work of older and advanced sculptors, which added importance to that section of the show. Noguchi's "Figure," Esherick's "The Wallop," Louise

Nevelson's "Young Bird," and "The Widow," an ebony figure by Warren Wheelock, approached pure abstraction. Charles Umlauf, Lu Duble, Hugo Robus, Mitzi Solomon, and Nathaniel Kaz touched expressionistic emotion. The work of Zadkine and Trajan could be classed *tour de force.* Herbert Ferber's sculpture showed his admiration of David Smith, whose sculpture was notable. Appreciation of the Whitney sculpture exhibit was shown in immediate purchases. Sculptures by José de Creeft, Jane Wasey, Oronzio Maldarelli, Chaim Gross, David Smith, Alfeo Faggi, Dorothy Greenbaum, and Jo Davidson were purchased by the Whitney director for the Metropolitan. From its own funds, the Metropolitan bought examples of Herzl Emanuel, Antonio Salemme, and Elie Nadelman.

The Pennsylvania Academy of Fine Arts, through its jurors Heinz Warnecke, Herbert Hazeltine, and Warren Wheelock, awarded its Widner Medal to Waldemar Raemisch Pieta, in stone. Other sculptures favored were: "North Wind," by Hugo Robus; "Polynesian Eve," by Harry Rosin; "Birth of a Snake," by Charles Cutler; "Blues Player," by Seymour Lipton; "Spiders as Acrobats on a House," done in bronze, by Mary Callery.

NON-OBJECTIVE SUBJECTS

Artist-veterans returning from foreign lands have noted the readiness with which Americans have accepted and developed non-objective subjects, carrying them through to pure abstractions. Some of this output is only vaguely suggestive, much of it is clever, all of it will probably tend to liberate the tensity which is inherent in sculpture. Such comparisons as that which brought the work of Noguchi, Hare, Roszak, and Kairos together must be enlightening. Another collection of vital interest was that which pitted the sculptor against himself: The Zorach of today against the Zorach of 1918; Lachaise with Lachaise of 1919; Laurens of today with Laurens of "The Toilette" and "The Man With a Clarinet." The work of 20 years back included "A Head," by Henry Moore; "Dragon Motif," by the late John Flanagan; "Torso of a Woman," by Sam Cashwan; "The Slaves," by José de Creeft; and other examples by Ben-Shmuel, Charles Cutler, Mary Callery, Adolph Dioda, Henry Kreis, and G. L. K. Morris.

NEW PROJECTS

New projects include that of the Clay Club of New York; its Sculpture Canteen during the war attracted 1,650 service men. José de Creeft, Chaim Gross, Jean de Marco, Richmond Barthé, and Lu Duble, with others seek to enlarge their quarters and make such activities permanent.

By far the greatest project for the American sculptor and his art is that South Carolinian domain, composed of three large estates landscaped into one perfect setting—with every phase of architectural device and garden planting—for the 600 pieces of American sculpture with which it began. This gift of Mr. and Mrs. Archer M. Huntington is endowed with sustaining millions and other purchasing millions. The Huntingtons are modest. News of this memorial to American sculpture is almost impossible to acquire, but it is bound to become a national shrine to the art that has always found a hesitant progress along precarious paths.

JOHN FLANAGAN

The purchase, by the St. Louis Art Museum, of a "Girl With a Horse," by John Flanagan, revives the memory of an extremely gifted man. This particular example is one of his most sensitive compositions, wrought in limestone. It was sent to Green Acres School, Silver Spring, Maryland, to secure his daughter's tuition for the year, but, the great sculptor died by suicide before it was redeemed. Lovers of American sculpture, everywhere, will welcome back Flanagan's "Girl With a Horse," to be seen now in the St. Louis Art Museum.

F. D. ROOSEVELT STATUE FOR LONDON

English friends and grateful admirers of Franklin D. Roosevelt commissioned the Scottish sculptor, Sir William Reid Dick, to make a statue of the American President, which stands in Grosvenor Square, London. The first model—a figure standing and wearing a cape—was widely criticized, and protests are rife between the realists, who want the figure seated, and those, who from an artistic view want it standing. In America, the President's affliction, as such, was ignored; instead, the March of Dimes, a noble project was founded upon it. Furthermore, throughout the ages seated figures have found favor. The two best, maybe the most loved, portraits of Lincoln are seated: one, in Chicago, by Augustus Saint-Gaudens; the other in Washington, D. C., by Daniel Chester French. On behalf of any sculptor, it should be said he considers the years to come and the element of permanence.

THE OUTLOOK FOR SCULPTURE

What of sculpture in this period of readjustment from war and ruin? It is folly to assume that today's abstraction could adequately serve the need of the United Nations Educational, Scientific, and Cultural Organization, but with something to say, together with the craftsmanship of the modern sculptor, it is not unreasonable to expect that for the second time in the Christian era, sculpture may take a place comparable to the interpretation of Ghiberti's painter-like bronzes, Michelangelo's powerful suggestion, Leonardo's scholarship, Donatello's directness, and the mystery of Rodin's light and shade.

For the sake of 8,000,000 veterans, the group from which America's UNESCO freshmen will mostly come, a brief survey of sculpture is in order. It is not too much to claim for the art that, in its continuity, it presents an amazing account of mankind. The realism couched in sculptured form often caused it in ages past to be accepted as an actuality rather than as a symbol. The gods men fashioned for themselves were sculptured. There were reasons for that first commandment forbidding "other gods." This phase of the story is thrilling and variable.

The colossi of the ancient world merged into god-likenesses. The Great Sphinx, with its lion-body symbolic of power, is only one of Egypt's Pharaoh-portraits. Assyria and India had gigantic figures that endured for centuries. The Colossus of Rhodes, which took Chares 12 years to make, was only one of the Greek colossi. Others were: Zeus and Herakles by Lysippus; the Apollo by Calamis, and the better known Zeus of Olympia, Athena in the Parthenon, and Athena Promachos on the Acropolis, all three by Phidias. When these were lost the world had forgotten "graven images," though Japan made several enormously imposing statues to Buddha as late as 700 *A.D.*

The New World has only three sculptures comparable with the colossi just mentioned. Christ of the Andes, in South America, is one. The others are in the United States. Nothing in modern times has touched the magnitude of Gutzon Borglum's portrait group of Washington, Jefferson, Lincoln, and Theodore Roosevelt, carved on Mt. Rushmore, Black Hills, South Dakota. The third large statue (Liberty) is the work of Bartholdi, French sculptor. In significance and purpose, and its association with New York Harbor, however, it is decidedly American and becoming fundamentally more so as time passes.

As soon as fighting ceased, authorities in Paris took Venus of Milo and the Victory of Samothrace from their wartime hiding, installed them in their wonted places and threw open that small section of the Louvre to American soldiers. In a few days, hundreds of thousands of these New World guests had filed by the sculptured entities. They moved slowly in their long line, laughed, joked, and "clowned" as American boys would to hide an erstwhile dread and now an indescribable relief, but, as the statues came into view their merriment ceased. Only the shuffle of their feet was heard as voices were hushed and smiles left their faces. It was as if these men of a New World, which they had fought to save, had touched the ideals—the soul of Ancient Greece, in the Venus, pure, undefiled, and unapproachable, and the headless Nike of Samothrace whose windblown garments revealed the swiftness of her triumph even as her folding wings told of the price of her victory, a cost each and every one of the American soldiers knew.

Weeks later, at a long journey's end, American men and boys glided into calm shore waters to disembark at their largest home port. They have thrilled at New York's astounding skyline. But their American hearts must have missed a beat as their American eyes rested upon the youngest of the world's colossi—Liberty holding her torch aloft. In no way is she comparable with Venus of Milo, or with Nike of Samothrace, save that the latter also served her people, with a difference in the task. Liberty as a fixed, muted, voiceless stone has accomplished her trust with a gesture that gave her a name: *Liberty Lighting the World* with *Time* running out.

MUSIC AND THE OPERA

By Warren H. Potter

Editorial Writer, *Musical America*

GENERAL

The first post-war year brought a tremendous expansion to the profession of music. Men returning from the battlefields and outposts of the world rejoined the orchestras and choruses they had left years before. New orchestras swelled some 150 already in existence; recitalists returned to their peaceful pursuits and the lifting of restrictions imposed upon international relations proved a stimulus to the circulation of music and artists between countries hitherto cut off by the rigors of war.

In Pittsburgh, June 19, managers of 20 major orchestras with yearly budgets of $100,000 or more, ascertained that their combined attendance had reached the phenomenal number of 5,000,000, an increase of 1,500,000 over the previous year.

Among the major musical figures to go abroad in 1946 was Arturo Toscanini, who returned to Italy to conduct at the LaScala Opera House in Milan, reconstructed with the aid of American funds. He was preceded to Europe, however, by Karl Krueger, the first guest conductor from America to appear there since the war, who left New York on March 20 for an extended tour abroad. Leonard Bernstein, conductor; Samuel Barber, composer; Eugene List, pianist, and his wife Carroll Glenn, the violinist, represented the United States at the International Festival of Music held in Prague, Czechoslovakia, during the summer.

Maurice Abravanel visited Australia where he conducted all the major orchestras; Otto Klempèrer flew to Europe to conduct many major orchestras, and Robert Casadesus, the eminent pianist, returned to France to reorganize the Fontainebleau School of Music, of which he was appointed director, and to play abroad. Zino Francescatti, violinist, returned to his native France for the first time in five years, and England exported to America Sir Thomas Beecham, Sir Adrian Boult, and Benjamin Britten.

During the week of Oct. 21-26, the International Confederation of Societies of Authors and Composers (CISAC), and the Inter-American Federation of Societies of Authors and Composers (FISAC), met concurrently in the Library of Congress. This was the first time either of the groups had convened in this country. For ICSAC, it was its 15th annual meeting and the first since 1938.

Perhaps the surest index to the

trend of the time was the expansion of the managerial field which George Engles re-entered after an absence of five years and to which he returned as president of the Consolidated Concerts Corporation. Walter Preston and Larry Fitzgerald revived the Wolfsohn Bureau, said to be the oldest musical agency in the world, and James A. Davidson formed his own concert bureau, the James A. Davidson Management, Inc., on Nov. 2. Meanwhile, National Concert and Artists Corporation and Columbia Concerts were busily engaged in organizing tours abroad for the artists under their auspices as rapidly as possible and endeavoring to establish in disorganized Europe, a network similar to the Civic and Community Concert services in the United States.

Educators awakened with renewed vigor, and the Music Teachers National Association held its 70th annual meeting in Detroit, beginning Feb. 20. The National Association of Schools of Music also met in Detroit, Feb. 19-20, and the Music Educators National Conference and National Catholic Music Educators Association held their tenth biennial convention in Cleveland, March 26-April 2. The Juilliard School of Music and the Institute of Musical Arts set the Army and Navy a good example by amalgamating under the name of the Juilliard School of Music. Detroit, a musical convention city in 1946, was also the scene of an encouraging new development: the First Congress of the Fellowship of American Composers, held there from May 6-10.

OPERA AT THE METROPOLITAN

During 1946 Scandinavia infused new life into the Metropolitan Opera performances with the export from Sweden of several of her principal artists, chief among these Torsten Ralf, Joel Berglund, and Set Svanholm. The latter's appearances in Wagner's music-dramas as Tristan, Siegfried and Lohengrin and as Radames in Verdi's "Aïda" achieved an artistic height not often attained at the Metropolitan or any other opera house. The year began, tamely enough, with a production of "La Bohème" on Jan. 1, but four days later, on Jan. 5, Puccini's "Il Tabarro" (The Cloak) was revived after a lapse of a quarter of a century. Bracketed with the short work was another revival, "Don Pasquale," which had not been heard for five years. Principals in the "Il Tabarro" cast were Licia Albanese, Frederick Jagel, and Lawrence Tibbett. The work proved popular with the public in subsequent performances, though in setting, direction, and musical content it lacked lasting value.

Other works restored to the repertory were "Madame Butterfly," on Jan. 19, kept from production during the war by the embarrassing nature of its libretto, and the return, on Jan. 12, after a year's absence, of "The Tales of Hoffmann," with the sterling French singer, Marital Singher, dominant. Another superb characterization was that of Joel Berglund as Hans Sachs in "Meistersinger" on Jan. 9, a carefully conceived and warmly executed performance in the great tradition of Van Rooy, Feinhals, Whitehill, and Schorr. Another acquisition by the opera house management was that of George Szell, the eminent orchestral conductor, whose readings of "Meistersinger," "Rosenkavalier," "Götterdämmerung," "Don Giovanni," and "Otello" were nothing short of superb.

Other additions of importance to the roster of singers in 1946 were those of the American artists Robert Merrill and Mary Henderson; the Chilean tenor, Ramon Vinay; Florence Quartararo; and Giacomo Vaghi. The annual "Ring Cycle" was not given in the Spring of 1946, a loss occasioned, as the management announced, by the commitment of its chief Wagnerian artists to other fields. Bearing the principal burden of the Wagner music-dramas in the winter season of 1945-46 were the soprano, Helen Traubel, and tenor, Lauritz Melchior, though in the Fall of 1946, Set Svanholm lightened Melchior's arduous duties. The latter was honored on Feb. 17 as he celebrated his 20th year at the Metropolitan, and a month later, the eminent bass, Ezio Pinza, also observed the completion of his second decade with the institution.

In the spring the Opera conducted a radio poll, giving 123,000 members of its air-audience the opportunity to choose six operas to be performed in the following season. The winners were "Aïda," "Carmen," "Traviata," "Hansel and Gretel," "Boris Godunoff," and "Der Rosenkavalier." The Metropolitan Opera Guild presented the management with a cheque for $25,000 to defray the expenses of a new production in 1946-47, and after its annual spring tour, visiting 12 cities throughout the nation for a total of 47 performances, the management announced that, for the second year, it had achieved a profit of $4,370 for 1945-46, owing to its post-season tour.

During the late summer, because of a conflict with the American Guild of Musical Artists concerning pay and working conditions, the fall season lingered for some weeks dubiously in the balance, but negotiations were resumed, relations satisfactorily patched up, and "Lakme," with Lily Pons, or Lily Pons with "Lakme"—since they are almost synonymous now—opened the new season Nov. 11. Louis Fourestier made his debut as conductor at this first performance of the 18-week season. Raoul Jobin sang opposite Lily Pons and Irene Jordan made her debut as Mallika on opening night.

Notable performances and debuts in the Fall season were the first appearance of Set Svanholm with the company as Siegfried on Nov. 15, perhaps the chief artistic event of the year, and the debut on the same occasion of Fritz Stiedry as an excellent acquisition by the conductorial staff. Additional performances of exceptional artistic interest were Svanholm's interpretations of Radames in "Aïda" on Dec. 5 and his first Tristan on Nov. 20. A fall revival was that of Mozart's "Abduction from the Seraglio," Nov. 29 with Emil Cooper conducting and Charles Kullman, Eleanor Steber, Dezso Ernster, Pierrette Alarie, and John Carter among the principals. Felix Knight was engaged by the management and made his debut in "The Barber of Seville," Nov. 30; Fritz Busch (debut) conducted "The Marriage of Figaro" for the first time, Nov. 13, and "Trovatore" was welcomed back to the repetory after a year's absence, Dec. 7. Mussorgsky's great "Boris Godunoff" also re-entered the lists on Nov. 21.

Jerome Hines, a very promising young artist, made his debut as Mephistopheles in "Faust" Dec. 14, and earlier, Nov. 16, the French singer Renée Mazella and the American Claramae Turner appeared for the first time at the Metropolitan as Marguerite and Marthe, respectively, in the Gounod opera.

METROPOLITAN'S NEW SEASON PLANS

The management announced that it would produce during the 1946-47 season the Bernard Rogers-Norman Corwin opera, "The Warrior," based on the Biblical story of Samson and Delilah, the first American novelty scheduled since 1941-42. At its annual fall luncheon, the management and board of directors discussed plans for a new and larger opera house and disclosed the project for a home in Los Angeles for the Metropolitan Opera in its visits to that city, an auditorium to be constructed at a cost of between $20,000,000 and $30,000,000. Apart from these plans, still in a nebulous stage, there were several changes in management, Cornelius N. Bliss resigning as chairman of the board of directors. He was succeeded by George A. Sloan. Reginald Tonry was named house manager, succeeding Hugh Brown who served in that capacity for 25 years, shortly after the opening of the Fall season. Broadcasts were begun Nov. 16 and were to continue throughout the 1946-47 season under the sponsorship of Texaco and over the CBS network on Saturday afternoons. Edward Johnson continues as general manager of the Metropolitan.

CHICAGO OPERA

The Chicago, San Francisco, New York City Center, and other, smaller opera companies whose seasons are carefully scheduled not to conflict with that of the Metropolitan Opera, also enjoyed unusually active seasons. Both the Chicago and San Francisco companies draw largely upon the roster of the New York organization for their singers, with slight local variations, but their general casting and production bear the same eclectic stamp as that of the Metropolitan.

A gala production of "Aïda" began the Chicago Opera's season on Sept. 30 with Fausto Cleva again General Artistic Director. The repertoire contained eight Italian operas, three French, two American and two German. The native works were Gian-Carlo Menotti's frothy and amusing "Amelia Goes to the Ball" and Gruenberg's "Emperor Jones," with Lawrence Tibbett, both given Oct. 4. Ferruccio Tagliavini, later to appear at the Metropolitan Opera, was imported from Italy to make his debut in "La Bohème" Oct. 2. The season closed with a revival of Thomas' "Mignon" Nov. 9, and in between the two dates were given "Tristan," "Rigoletto," "Lucia di Lammermoor," "Madame Butterfly," "Tosca," "La Gioconda," "Carmen," and "Samson and Delilah." The conductors for the season were Erich Leinsdorf, Fritz Stiedry, Nicolas Rescigno and Fausto Cleva.

SAN FRANCISCO

The San Francisco Opera Company, Gaetano Merola, General Manager, embarked Sept. 7 upon the most extensive season in its history, giving 50 performances between the opening date and Nov. 3. Four works were given in Portland, Ore., beginning Sept. 7, including "Carmen," "La Bohème," "La Traviata," and "Lohengrin." Then the company moved to Seattle offering the same four works there on Sept. 12-15. The San Francisco season proper was launched on Sept. 17, and it was on the West Coast that Set Svanholm made his American debut, appearing in the title role in "Lohengrin," Sept. 17. The series extended over a period of five weeks, the last two being played in Los Angeles starting Oct. 21. A total of 17 operas was given, including in addition to those mentioned, "Boris Godunoff," "Tristan," "Romeo and Juliet," "Madame Butterfly," "La Forza del Destino." "Fidelio," "Der Rosenkavalier," "Lakme," "Lucia di Lammermoor," "Il Trovatore," "The Marriage of Figaro," "Rigoletto" and "Don Pasquale." New to the company were Regina Resnik, Maria sa Earp, Astrid Varnay, Mario Berini, George Czaplicki, Nicola Moscona, Kenneth Schon and Set Svanholm. Conductors were Merola, George Sebastian, William Steinberg, Pietro Cimara, and Paul Breisach.

NEW YORK CITY CENTER OPERA

The New York City Center Opera, one of America's most enterprising opera companies, began its spring season, May 10 with "Rigoletto" and followed that work with productions of "La Bohème," "Madame Butterfly," "Carmen," "La Traviata." During the short series which concluded June 1, several notable singers made their debuts. Camilla Williams, a Negro, sang the role of Butterfly in the Puccini work, winning high praise, and Enzo Mascherini made his first appearance in "La Bohème." The company continued its good work in the fall, offering opera four nights a week for 10 weeks under the direction of Laszlo Halasz. A highpoint of the season was the performance of Richard Strauss' delectable chamber opera, "Ariadne auf Naxos," given its first American performance, Oct. 10. A truly memorable production, it enlisted the services, as chief singers, of Ella Flesch as Ariadne, Virginia MacWatters as Zerbinetta, Ralph Herbert as Harlequin and Polyna Stoska in the role of the composer. Halasz conducted. Another notable service to music was the revival by the company of Tchaikovsky's "Eugen Onegin" Nov. 14 with William Horne, Ivan Petroff, and Brenda Miller as principals.

In the preceding spring, Columbia Theater Associates gave a performance of Giovanni Paisiello's "The Barber of Seville," notable as the historic predecessor of Rossini's deathless buffa. Also in New York, the Juilliard School of Music revived Weber's "Der Freischütz" from Dec. 13 to 17, a production interesting more as a novelty than for excellence of production.

OPERA IN OTHER CITIES

The New Orleans Opera House Association regained much of its past glory and traditions in 1946 with performances of Gian-Carlo-Menotti's "The Old Maid and the Thief" and "Pagliacci" on Jan. 17 and 19 and later "Hansel and Gretel," "Manon," "Aïda," "Traviata," and in the Fall, opening on Oct. 11 with "Butterfly" followed by "Traviata," "Aïda," "La Bohème" and "Carmen." Walter Herbert is general director and conductor, and the new president is Hugh M. Wilkinson.

The Fort Worth Civic Opera Association, a new organization, gave "La Traviata," Nov. 25, a community project backed by the public to the extent of $10,000.

The San Antonio Opera Festival was held Feb. 19-24, netting a $15,500 credit for its sponsor with "Carmen," "Tosca," and "La Traviata." A new organization was also formed in Pittsburgh under the name of the Civic Light Opera Association with a season of light opera in June. A colorful festival was that in Central City, Col., which opened on July 6 with "The Abduction from the Seraglio" by Mozart and continued for 25 performances, alternating with "La Traviata." The works were produced by Frank St. Leger and staged by Herbert Graf. and the season was completed July 28.

Cincinnati Summer Opera, under the general direction of Fausto Cleva, observed its 25th anniversary season, opening June 30 for a six-week season including 18 different operas.

TOURING OPERA

Chief among the touring opera companies is that of the Philadelphia LaScala which gave performances in Philadelphia, Baltimore, Washington, Buffalo, Detroit, and Pittsburgh. The principal novelty of its spring season was a revival of Giordano's "Andrea Chenier" on March 21. A total of 49 performances of works from the standard repertoire was given at home and on tour under the artistic direction of Francesco Pelosi, general manager. Giuseppe Bamboschek was musical director and Benjamin Altieri, stage director. H. Birchard Taylor was elected chairman of the board of directors. The National Grand Opera Company, Giorgio D'Andria, general director, gave its annual festival for the Essex County (N. J.) Symphony Society, and on May 27 in Newark began a series of three performances of "Madame Butterfly," "Faust," and "Aïda." The group also offered on tour "Aïda" and "Butterfly" in New Haven and "Tosca" in Hartford, Conn. Late in September, the ensemble began its regular transcontinental tour. During the fall, the Charles L. Wagner Opera Company made its annual eight-week tour in October and November, offering the one production, "Il Trovatore." Fortune Gallo's San Carlo Opera Company made its 35th annual nationwide tour, and the Philadelphia American Opera Company made its debut in that city Oct. 24 with Mozart's "The Abduction from the Seraglio," a work which proved popular with almost every American company during the year. Vernon Hammond is the director of the American Opera Company.

BERKSHIRE MUSIC FESTIVAL

Though it is the youngest of all the major American music festivals, the annual Berkshire Summer Music Festival now assumes first place by virtue of the importance of the music performed and ensembles participating. In 1946 the Festival was held at the organization's home at Tanglewood in Lenox, Mass., in conjunction with the Music Centre School, on July 25-28, and Aug. 1-4, 8, 10-11. Serge Koussevitzky led the Boston Symphony in the American premieres of Shostakovich's Ninth Symphony and of Benjamin Britten's challenging opera, Peter Grimes, for which the composer came to America. Major soloists were heard with the orchestra in the course of the nine concerts. Prior to the Festival proper, four chamber music concerts devoted to Bach and Mozart were given at the Music Centre.

OTHER MAJOR FESTIVALS

Among other major festivals were the Bethlehem Bach Festival, held in Bethlehem, Pa., May 17 and 18 and conducted by Ifor Jones; the 87th annual Worcester Music Festival, enlisting the Philadelphia Orchestra under Eugene Ormandy and noted soloists, in Worcester, Mass., opening Oct. 19 and bringing four familiar programs; and the 53rd annual May Festival in Ann Arbor, Mich., May 2-5. Attendance for the Ann Arbor passed the 30,000 mark. The Philadelphia Orchestra was the guest ensemble for the 11th consecutive season, and a dozen soloists and the 350-voice choral union and youth chorus also participated.

Under the direction of Richard Bales, the third American Music Festival was held in the National Gallery in Washington, D. C., in March; Baldwin-Wallace offered its 14th annual Bach Festival in Berea, O.; Brevard, N. C., held a four-day festival in August; Cincinnati observed its 36th biennial May Festival under Eugene Goossens' direction from May 7-11 in a series of five concerts; Bach was the theme again of the Carmel, Calif. annual festival held for one week in July; and St. Louis offered Bach works at its festival under William B. Heyne's direction on May 2-4.

Gian-Carlo Menotti's opera "The Medium" was given its world premiere on May 13 at the Columbia University Festival of Contemporary American Music, held May 10-13. The NBC Symphony, Martha Graham and her dance group participating and a program of music by Charles Ives, was given as a tribute to the 72-year-old composer. The Eastman School of Music's 16th annual Festival of American Music, Howard Hanson, director, was given in five evening and one afternoon performances at Kilbourn Hall, Rochester, N. Y., April 12-17 when first performances were given of music by Roy Harris, Wayne Barlow, Howard Hanson, Robert Palmer, Bernard Rogers, and many other composers. A Three-Choir Festival was held at Temple Emanu-El in New York City on March 24-30, devoted to Eurasian and the American West in song and dance.

One of the most colorful of American festivals returning to the scene after the war was the Colonial Williamsburg double series of three concerts which took place in Williamsburg, Va., on May 13, 15, 16, and 18 and again on six evenings in October, the festival being offered twice annually.

NEW YORK PHILHARMONIC-SYMPHONY

The oldest orchestra in the United States in 1946 fulfilled its most extensive year and for the first time in its history inaugurated a series of popular concerts in Carnegie Hall at the conclusion of its Spring season on May 4. During the course of the "Pops," as they were called following the example of the Boston Symphony and other major orchestras, 35 conductors and 200 soloists were heard in 49 concerts which ended on June 22. Earlier in the year, Igor Stravinsky conducted the first performance of his new symphony as guest with the Philharmonic on Jan. 24, and Roy Harris offered the first performance of his "Memories of a Child's Sunday" on Feb. 21. Artur Rodzinski was the regular musical director of the orchestra for the 1945-46 and 1946 seasons. At the close of its "Pop" series, the orchestra embarked upon its usual course of 38 concerts at the Lewisohn Stadium, appearing at the Stadium for an 8-week period and bringing noted guest soloists and ensembles before its summer public between June 17 and Aug 11. The summer budget was estimated at $260,000.

Artur Rodzinski was re-engaged as musical director and conductor at the outset of the 1946 season with Charles Münch, Bruno Walter, Leopold Stokowski and George Szell enlisted as guests. Ninety-nine concerts and 28 soloists were scheduled for the 105th year of the ensemble with Rudolph Ganz conducting the Young People's series and the Sunday concerts broadcast over the Columbia Broadcasting System under the sponsorship of the United States Rubber Company. Mr. Rodzinski launched the fall-winter programs on Oct. 3 and on Oct. 31 one of the year's notable concerts was offered when Maggie Teyte and Raoul Jobin were soloists with the orchestra in excerpts from Debussy's "Pelléas and Mélisande," an event little appreciated by the general public. American premieres were offered on Oct. 10 of Manuel Rosenthal's Musique de Table and of Barraud's Piano Concerto on Dec. 5. Heard also for the first time in America were the Noce-Villageoise of Lully-Rosenthal; Symphony No. 3 for Strings by Jean Rivier and Rosenthal's La Fête du Vin, all given under the baton of Manuel Rosenthal on Dec. 5. The Philharmonic also announced that at the close of its 105th season, it expected to make a Spring tour, offering 28 concerts between April 14 and May 11, with Rodzinski conducting 17 concerts and Stokowski 11. However, Rodzinski resigned suddenly on Feb. 4, 1947, effective immediately. Charles Triller was named president of the orchestra, succeeding Marshall Field.

NBC SYMPHONY

During 1946, the NBC Symphony again brought Arturo Toscanini as its chief conductor in its broadcasts from 5 to 6 P.M., EST. The noted conductor offered a program on Jan. 27 in honor of the 190th anniversary of Mozart's birth and the 45th of Verdi's death and on Feb. 3 and 10 led a 50th anniversary performance of Puccini's "La Bohème," a luminous recreation of the familiar score. The following season, on Dec. 1 and 8, he performed the same service for Verdi's "La Traviata." During the summer, the orchestra was conducted by Frank Black, Franco Autori, Leonard Bernstein, Fabien Sevitzky and Vladimir Golschmann. Toscanini offered 16 programs between Oct. 27 and Dec. 8 and Fritz Reiner assumed the baton on Dec. 15. Dame Myra Hess was soloist in a notable performance under Toscanini when she performed the Beethoven C Minor Piano Concerto on Nov. 24.

NEW YORK CITY SYMPHONY

Continuing in the Fall and beginning the second year of its life at the City Center, the New York City Symphony under Leonard Bernstein began a provocative series of programs on Sept. 23. The concerts continued for 10 weeks, through Nov. 26, interspersed with performances at the Center by the Opera Company. During the year Mr. Bernstein brought to first performance Marc Blitzstein's controversial work, "The Airborne" which was well received; David Diamond's Second Symphony, and other contemporary music by native composers, including John Lessard's "Box Hill Overture"; "Ode to the Milky Way" by Vladimir Dukelsky, and Revue for clarinet and orchestra by Alex North, all offered at the Center on Nov. 18.

BOSTON SYMPHONY

At the conclusion of its 1945-46 season under the baton of Serge Koussevitzky, during which it gave 60 subscription concerts, and visited Providence, Washington, D. C., New York, and New England towns on tour, the Boston Symphony began its 61st season of "Pop" concerts under Arthur Fiedler, continued with 17 Esplanade programs on the borders of the Charles River which were heard by 345,000 Bostonians, and offered 9 Berkshire Festival concerts. The ensemble opened its 66th season and 1946-47 series under Dr. Koussevitzky on Oct. 4. The schedule was again as heavy as that of the previous season with equally as many concerts, though Dr. Koussevitzky announced his intention to conduct fewer concerts, and to relinquish the baton to Richard Burgin his assistant and concertmaster of the orchestra and to guest conductors. On Nov. 29 the orchestra offered the American premiere of Camargo Guarnieri's Latin American Symphony and earlier in the year, in March, gave the first American performance of orchestral excerpts from Britten's opera "Peter Grimes," as well as the initial performance of the complete opera at the Berkshire Festival. Shostakovich's Ninth Symphony was also given its premiere by the Boston Orchestra and both works were introduced by the ensemble to other cities on tour. Allis-Chalmers again sponsored the orchestra's broadcasts over an CBS network from 9:30 to 10:30 P.M., EST, starting Oct. 8.

PHILADELPHIA ORCHESTRA

The Philadelphia Orchestra, Eugene Ormandy, conductor, completed its 1945-46 season on April 27, the 46th of its existence. An aggregate total of 400,000 attended the basic series of concerts in the Academy of Music, Philadelphia, and the various series in New York, Washington and Baltimore. To the start of the transcontinental tour, which began April 29 and ended June 9 with 39 performances in 30 cities, the schedule embodied 129 concerts. Early in the season, Ormandy offered the first hearing of Bartok's Piano Concerto No. 3 on Feb. 8 with Gyorgy Sandor as soloist. The orchestra began its summer series in Robin Hood Dell under Dimitri Mitropoulos on June 24. The 17th season of Dell concerts occupied seven weeks for a total of 28 concerts, Mitropoulos leading 19 of the 28 programs. The 1946-47 season opened on Oct. 4 with Ormandy again as musical director and Harl McDonald, manager. 17 major soloists were listed and as guest conductors, Bruno Walter, George Szell, Igor Stravinsky, Dimitri Mitropoulos and Alexander Hilsberg, concertmaster and assistant to Ormandy. Twenty-eight Friday afternoon and Saturday evening concerts, as well as 10 Monday evening programs, five Youth, five Children's concerts, 6 performances at the Worcester Festival and a November tour of the mid-west formed the heavy schedule. The orchestra's playing personnel included 104 men and every Saturday, throughout the season, the orchestra broadcasts over a WABC-CBS network from 5 to 6 P.M., EST.

CHICAGO SYMPHONY

A Brahms cycle, under the baton of Désiré Defauw, was of principal interest in the Chicago Symphony's 1945-46 season. Early in the year, Hans Lange, associate conductor, led the orchestra on a tour of 17 mid-western cities, beginning on Jan. 12. At the completion of its winter series, the orchestra began its 11th season of programs at Ravina Park on June 25, offering six weeks of symphonic music under five conductors and enlisting the aid of noted soloists and two chamber music ensembles. The orchestra, again under Defauw, began its 56th season on Oct. 3, a season that was to be distinguished by such occasions as the appearance of Dame Myra Hess as soloist with the orchestra on Oct. 31 after an absence of seven years. The premieres of Max Wald's "In Praise of Pageantry" and Arne Oldberg's Violin Concerto were given on Nov. 7. The roster of guest conductors included George Szell, Charles Münch, Bruno Walter and Fritz Busch. Concerts were given in the orchestra's home, Orchestra Hall and George Kuyper remains its manager. Approximately 106 concerts were scheduled for 1946-47.

CLEVELAND ORCHESTRA

Of greatest importance to Clevelanders was the acquisition of a new conductor, George Szell, who succeeded Erich Leinsdorf on Oct. 17. Szell increased the size of the orchestra by 11 members to 94, including two apprentice conductors. Three guest conductors were engaged: Bruno Walter, Georges Enesco and Igor Stravinsky and an even dozen of soloists. Szell directed 15 of the 20 pairs of concerts scheduled; Rudolph Ringwall, his associate, two; and the guests, one pair each. The 1946-47 season marks the orchestra's 29th year. C. J. Vosburgh continues as orchestra manager and its concerts are given in Severance Hall. The orchestra began its broadcasts on Oct. 19 and is heard on Saturdays over the MBS network from 6 to 7 P.M., EST, on Saturdays.

LOS ANGELES PHILHARMONIC

At the close of the Los Angeles Philharmonic's 1945-46 season, during which it offered 46 regular and 13 Youth concerts, it was announced that Alfred Wallenstein had been re-engaged as regular conductor for four more years with John Barnett as assistant conductor. The West Coast ensemble scheduled for its new season, a series of 90 concerts, a sizable increase over the previous season. Of these, 17 pairs are given in the Philharmonic Auditorium and 50 out of town. Charles Münch and Lukas Foss were chosen as guest conductors, and nine major soloists were engaged to appear during the season. Wilfred L. Davis remains the orchestra's manager.

SAN FRANCISCO SYMPHONY

With its 2,320th concert on April 13, the San Francisco Symphony, Pierre Monteux, conductor, completed its 34th season of 32 concerts for 1945-46. Shortly thereafter, its management announced that the orchestra planned an extensive tour of eight weeks' duration in the United States and Canada under the baton of Monteux, the first such tour undertaken by the orchestra. James Sample was appointed associate conductor for the tour. For 1946-47, the Symphony scheduled 16 pairs of Opera House concerts, 15 Thursday night "previews," four Youth concerts, led by Rudolph Ganz, two Youth concerts under Monteux and the engagement of 15 major soloists.

DETROIT SYMPHONY

With the conclusion of its 20th season and final concert of the 1945-46 season on March 14 in Masonic Temple, the Detroit Orchestra made its last appearance in that auditorium. Henceforth, all activities were to be concentrated in the Music Hall. At the opening of the new year on Oct. 24, Karl Krueger, the orchestra's regular conductor led the ensemble in the first concert of 18 pairs in the Music Hall. Henry H. Reichhold remains the president of the orchestra and its principal backer. Approximately 20 Youth concerts were scheduled by the orchestra for 1946-47. The orchestra also embarked upon a new Sunday evening broadcast series over an NBC network from 8 to 9 P.M., EST.

CINCINNATI SYMPHONY

In the last days of 1946, Thor Johnson was appointed musical director of the Cincinnati Symphony to succeed Eugene Goossens, who recently accepted the post of conductor of the Sydney, Australia, Symphony. Mr. Johnson will become director when Mr. Goossens retires in April. Earlier in the year, the orchestra was conducted by Mr. Goossens on a three-weeks' Southern tour at the conclusion of its 1945-46 season. During its formal season it gave 40 subscription concerts and enlisted the services of Leonard Bernstein as guest conductor, and the French conductor, Paul Paray. The opening concerts of the 1946-47 season were led by Vladimir Golschmann and again, 40 subscription concerts were scheduled. J. M. O'Kane remains the orchestra manager and concerts are held in the Music Hall.

MINNEAPOLIS SYMPHONY AND ST. LOUIS SYMPHONIES

The Minneapolis Symphony, Dimitri Mitropoulos, conductor, made its annual visits to Chicago as well as offering a course of 28 concerts and six Youth programs in its home city. The guest conductors Leonard Bernstein and Erich Leinsdorf also appeared with the orchestra during the season. Arthur J. Gaines remains the manager of the orchestra which gives its concerts in the auditorium of the University of Minnesota and enlists major soloists. The St. Louis Symphony, Vladimir Golschmann, conductor; William Zalken, manager, gave the 20th and final pair of concerts of its 1945-46 series on March 1 and 2. Its 67th season of subscription events was opened on Oct. 18 by Mr. Golschmann. The ensemble's 1946-47 series enlists 15 major soloists for its programs in the Kiel Opera House.

INDIANAPOLIS SYMPHONY

With the opening of the Indianapolis orchestra's 1946-47 series. Fabien Sevitzky, conductor, marked his tenth anniversary as musical director on Nov. 7. 86 concerts were scheduled for the 21-week season including NBC broadcasts and 37 out-of-town concerts, a tour list which includes a second appearance in Carnegie Hall, New York, the seventh in Chicago and first in Kansas City. In addition to the usual subscription concerts are the 10 concerts played in public schools, municipal and industrial concerts. The orchestra was given a grant by the city of Indianapolis of $50,000 for the fourth consecutive year. The previous formal season closed when Mr. Sevitzky led the 12th pair of subscription concerts in Murat Theater on March 30 and 31. Howard Harrington remains orchestra manager.

KANSAS CITY PHILHARMONIC

Two major appointments marked the course of the Kansas City Philharmonic. Efrem Kurtz was signed for two additional years as conductor and M. L. Henderson was appointed business manager following the resignation of Ruth Seufurt. It was estimated that the orchestra's earnings this season will pay 85 per cent of its operating expenses. There will be no deficit this year and next season a backlog of some $20,000 will remain on hand according to the management. Kurtz opened the season on Oct. 15 scheduling 10 pairs of subscription concerts and in addition, free concerts and a popular series. Nine major soloists have been enlisted. Events are given in the Music Hall. The 1945-46 series brought 20 subscription, 6 popular and two Youth programs.

ROCHESTER PHILHARMONIC

The Rochester Philharmonic adhered to a policy of guest conductors in 1945-46, 1946-47, enlisting the aid of Leonard Bernstein, Erich Leinsdorf, Georges Enesco, Vladimir Golschmann and Guy Fraser Harrison. Six soloists were engaged for 1946-47. In March Mr. Bernstein led the orchestra in a New York concert playing Harold Shapero's Serenade in D for strings, which won a $1,000 award, and also Aaron Copland's Danzo Cubano, for the first time in the same city. Twelve subscription concerts are given in the Eastman Theater in Rochester and the orchestra's manager remains Arthur M. See.

NATIONAL SYMPHONY

Shortly after J. P. Hayes was appointed general manager of the National Symphony on May 21 the orchestra began its 10th series of summer Watergate Concerts on June 16. The series ended on July 26, a total attendance of 208,500 having heard the orchestra in the 18-event, six-week season. For 1946-47 the orchestra enlarged its series to 24 weeks, two longer than the previous one. The Sunday series at Constitution Hall was increased from 10 to 12 events and the Wednesday series from 10 to 12. The orchestra also increased its Baltimore visiting programs by one. Launching its 16th season on Oct. 16 with 100 players, on Nov. 27 the ensemble began a new "Hit Parade" series. Hans Kindler is conductor.

BALTIMORE SYMPHONY

The Baltimore Symphony, Reginald Stewart, conductor, celebrated its 30th anniversary on Feb. 6 with a program that included the world premiere of "A Peace Overture" the composition of Gustave Strube, one of the founders of the orchestra. In 1946-47 the orchestra performed, together with the assistance of the musical forces of the Peabody Conservatory, the entire musical output of Johannes Brahms, some 600 works, in commemoration of the 50th anniversary of that composer's death. Its schedule includes 12 mid-week concerts and 8 Sunday night events. C. C. Cappel is manager of the ensemble which plays in the Lyric Theater.

PITTSBURGH SYMPHONY

The Pittsburgh Orchestra's plans for 1946-47 include a six-week tour of the South and Mexico. Under Fritz

Reiner, regular conductor, the orchestra opened its season on Oct. 18 in Syria Mosque in the first concert of 20 pairs of Friday night and Sunday afternoon events. Five popular and several children's concerts are also being given. The orchestra has been increased to a personnel of 80 and eight soloists have been engaged. Edward Specter remains the manager. In 1945-46 the ensemble offered 40 concerts exclusive of popular and Youth programs.

SAN ANTONIO AND NEW ORLEANS

The San Antonio Symphony, Max Reiter, conductor, played 15 concerts in 1945-46 ending its earlier season on March 31. For 1946-47, the management launched a campaign for a $115,000 sustaining fund and enlisted a roster of 12 soloists. On Nov. 9 it began its new series under Mr. Reiter and added a series of five popular concerts to its agenda. The New Orleans Symphony, upon the completion of 1945-46 programs, renewed Massimo Freccia's contract as conductor for two more years. Also scheduled were 16 Tuesday evening concerts, with 11 major soloists.

DALLAS, COLUMBUS, AND HARRISBURG

The Dallas Symphony completed in the Spring its first year under the baton of Antal Dorati and a new management. Twelve subscription programs were given and four Youth programs. Increasing his ensemble to 92, Dorati launched the new season on Nov. 3, planning to offer 14 subscription programs, an increase of two; 8 special concerts, four of these devoted to a Brahms festival, and 15 out-of-town engagements.

In 1946 the Columbus, Ohio, Symphony entered the ranks of professional orchestras with an ensemble of 80 members led by Izler Solomon in 10 subscription, 10 popular, five children's and four out-of-town concerts. Six soloists were engaged for the subscription series. Norman Stuckey was appointed new manager of the orchestra.

The Harrisburg, Pa., Symphony, George King Raudenbush, conductor, began its 17th season on Oct. 8 with a schedule of 7 concerts, similar to that of its 1945-46 season. Mrs. Arthur Hull is president of the Symphony Society and the orchestra plays in the Forum.

OTHER ORCHESTRAS

The Buffalo Philharmonic enlisted as guest conductors in 1945-46, Izler Solomon, Ignace Strasfogel, Jan Wolanek and Victor Alessandro, with William Steinberg as permanent conductor, re-engaging the latter for the 1946-47 season of 10 concerts.

The Seattle Symphony concluded its winter series on Feb. 18-19, playing Carl Bricken's Second Symphony for the first time. With Mr. Bricken conducting, the symphony began its 45th season on Oct. 21 launching 11 pairs of concerts that are to conclude on Feb. 25, with six major soloists appearing. Phil Hart was recently named manager of the orchestra, while Hector Escobosa remains president.

For the fifth year, the Duluth Symphony re-engaged Tauno Hannikainen as conductor for 1946-47, opening its series on Nov. 1 and with a scheduled roster of six soloists.

The Rhode Island Philharmonic, Francis Madeira, conductor, a new group formed in 1945-46 expanded its season for 1946-47, not only in Providence, its home city, but also in other Rhode Island towns which it visits on tour. It has been officially adopted as the Rhode Island State Orchestra.

The Denver Symphony launched its 13th season on Oct. 9 under the baton of its regular conductor, Saul Caston planning to offer approximately 15 concerts in City Auditorium. Helen Black remains manager.

NEW MUSIC

The two most important new scores offered in 1946 were by foreign composers, an Englishman and a Russian: Benjamin Britten with his opera "Peter Grimes," and Shostakovich, with his Ninth Symphony, both works introduced to America by Serge Koussevitzky and the Boston Symphony at the Berkshire Festival. In composition the United States was not a member of the "Big Three," but if we had no monumental scores to show, our composers were not inactive, and in the lesser forms many works, some of them revealing decided talent, were brought to light.

However, two major American works were of signal importance: Samuel Barber's Cello Concerto, again introduced by the Boston Symphony, and at the Columbia University Festival, Gian-Carlo Menotti's opera "The Medium." The former was awarded the coveted testimonial of the New York Critic's Circle and the latter won moderate praise, more as an operatic experiment, than for any intrinsic value in the score. The Philadelphia Orchestra gave the world premiere of Bela Bartok's third Piano Concerto and another Hungarian, Zoltan Kodaly, led the first American performance of his "Peacock Variations" with the same orchestra on Nov. 22.

The New York Philharmonic introduced a quantity of new music, though obviously not much of it was destined to outlast a season. It included (and not necessarily in the foregoing category), Gruenberg's Violin Concerto, Op. 47, first played on April 3; William Grant Still's "Poem" for orchestra, first played on April 4. The Philadelphians offered Louis Gesenway's Concerto for flute on Nov. 1 and the Collegiate Chorale led by Robert Shaw proffered Hindemith's "When Lilacs Last in the Dooryard Bloom'd" in the City Center on May 14. At the Eastman School, a fertile bed of first performances, Weldon Hart's First Symphony, Bernard Rogers' "To the Memory of President Roosevelt," and George McKay's Concerto for cello and orchestra were performed on April 16. In New York City, the National Orchestral Association under Leon Barzin gave the premiere's of Richard Arnell's Violin Concerto, Op. 9 and Stanley Bale's Sinfonietta No. 2, Opus 39. The Boston Symphony played a novelty in New York on Nov. 16, Aaron Copland's Third Symphony. The National Orchestral Association, again under Mr. Barzin, on May 20 introduced "Overture: Jubilation," Adagio and Allegro by Robert Ward; "Fantasy" for violin and orchestra by George Kleinsinger, and a "Requiem" by Lazare Saminsky, in Carnegie Hall. Finally, as a sample of the shape of things to come, a new electronic device called a tone synthesizer, was demonstrated before the American Physical Society in the McMillin Theater at Columbia University. Dr. Harvey Fletcher gave the demonstration which revealed that the device can reproduce every kind of tone, including those of the human voice, as well as all tones familiar to musicians, and millions of others which no known musical instrument can make. The synthesizer was developed at the Bell Telephone Laboratory.

AWARDS

Many important awards were announced in 1946, chief among these were eight Guggenheim fellowships to John Lessard, John Verrall, William Bergsma, Harold Shapero, Alexei Haieff, Henry Brant, Gian-Carlo Menotti and Louise Talma. Samuel Barber was awarded the Testimonial of the New York Music Critic's Circle for his Concerto for Cello and orchestra, and David William Nadien, 20-year-old violinist, received the Leventritt Award, an appearance as soloist with the New York Philharmonic-Symphony under George Szell on Dec. 22 at Carnegie Hall. Max Pressler of Palestine won the $1,000 Debussy award in San Francisco Sept. 7. The Hollywood Bowl Association announced that it would annually give a cash prize of $1,000 to be known as the Gershwin Memorial Award, and Charles L. Wagner, manager of the Wagner Opera Company, offered $1,000 and performance for an original opera based upon an American theme.

THE THEATRE

By Edwin T. Duffy
News Department, *The New York Times*

AMERICAN REPERTORY THEATRE

The first post-war theatre year found New York's theatrical scene engaged in one of the most expansive and, for the most part, highly rewarding seasons of its career. The overall picture of the year's activities discloses several items of paramount importance. One was the creation of the long-awaited American Repertory Theatre with Cheryl Crawford, Margaret Webster, and Eva Le Gallienne serving as its main officers. Although the early selections of the company puzzled some observers, the majority of critics and playgoers realized the necessity for a resident repertory group and saluted the motives behind the organization. Financially, the A.R.T., as it soon became known, was faring satisfactorily, if not brilliantly, at the close of 1946 and its directors already were talking over plans for road company divisions of the repertory theater itself. The acting contingent was headed by Miss Le Gallienne and Miss Webster, and included such notables as Victor Jory, Walter Hampden, Ernest Truex, Richard Waring, and the film actress, June Duprez. The directorial chores were divided between Miss Le Gallienne and Miss Webster with Mr. Jory taking over the reins for the Sean O'Casey one-acter, "Pound on Demand." As for the productions themselves, the group presented Shakespeare's "Henry VIII"; Barrie's "What Every Woman Knows"; Ibsen's "John Gabriel Borkman"; Shaw's "Androcles and the Lion," coupled with the O'Casey one-acter previously recorded.

OLD VIC COMPANY IN NEW YORK

Repertory of a different nature came along during May of 1946 when the Old Vic Company of London was transported to New York for a limited engagement under the aegis of Theatre, Inc. The famous British company was accorded one of the heartiest welcomes in theatrical history. From opening night until the final performance, the Old Vic fared tremendously well. The cast, which was headed by Laurence Olivier, Ralph Richardson, Margaret Leighton and Joyce Redmond, was seen in Shakespeare's "Henry IV, Part I and Part II," Chekhov's "Uncle Vanya," Sophocles' "Oedipus," and Sheridan's "The Critic."

EUGENE O'NEILL

The 1946 theatre year went down in the annals as the one which brought forth Eugene O'Neill's drama "The Iceman Cometh," the first new work from America's number-one dramatist in many years. The play was a symbolical drama whose action took place in a seedy New York saloon in the year 1912. There, a group of derelicts and drunks gather to await the visit of their staunch drinking companion, Hickey, who is about to pay his annual call. Instead of the carousing drinking pal, however, they are shocked to discover a new Hickey who confesses to the murder of his wife and who exhorts them to give up their day-dreams and settle down to reality as the only means of finding their true selves. Woven into the play were many of the author's ideas on life, and, while the play suffered from occasional overwriting and, certainly, overlength, it still represented America's first playwright at his best. With an excellent cast, including James Barton, Dudley Digges, Carl Benton Reid, and Nicholas Joy, "The Iceman Cometh" became New York's top dramatic hit and added to its author's reputation as one of the theatre's most profound dramatists and thinkers.

REVIVALS

General. — The final outstanding trend of 1946 was the theatre's retreat from contemporary new dramas to outstanding successes of the past. Theatrical logicians were not amiss in calling the 1946 year "the year of the great revivals." Including the four productions of the American Repertory Theatre and the five staged by the Old Vic Company, the year's total for revivals came to 19. Not all were successful, to be sure, but the over-all picture indicated that almost any pronounced success of an earlier day faced a fair to extremely good chance of settling down for a comfortable run.

"Playboy of the Western World." —To this observer, the year's most satisfying revival was the one accorded the J. M. Synge Irish Comedy, "The Playboy of the Western World." Carefully produced by Theater, Inc., the oft-told tale of the County Mayo braggart benefited from the gifted direction of Guthrie McClintic and a fine assemblage of actors, including Burgess Meredith in the title role, Mildred Natwick as the amorous Widow Quinn, and Eithne Dunne as Pegeen Mike. Miss Dunne, who was imported from Ireland, where she is acknowledged as one of the first ladies of the Irish stage, brought lyric beauty and deep feeling to the performance and was, certainly, one of the most appealing and talented young actresses to be seen in our theater in many years.

"Cyrano de Bergerac." — Brian Hooker's version of the famous Rostand comedy "Cyrano de Bergerac" was brought to glowing life via the inspired performance of Jose Ferrer in the title role. The new production of the classic was an immediate success and much praise also was bestowed upon the performances of Frances Reid as Roxanne and Paula Laurence as the Duenna.

"Lady Windermere's Fan." — The witty Oscar Wilde comedy "Lady Windermere's Fan" also was beautifully revived and once again this comedy of high class morality stood the test of time. Lavishly designed by Cecil Beaton, the production saw Cornelia Otis Skinner in the pivotal role of Mrs. Erlynne giving one of the best performances of her career and added new laurels to the reputations of such excellent performers as Estelle Winwood, Henry Daniell and Penelope Ward.

Musicals. — Even in the musical field, a revival put in an appearance. That was the resuscitation of "Show Boat," the popular Jerome Kern-Oscar Hammerstein musical based on Edna Ferber's novel of the same name, which proved as popular with a new generation of theater-goers as it did when it was first staged many years ago. Another old-timer to crop up was the George Manker Watters-Arthur Hopkins comedy, "Burlesque." With Bert Lahr and Jean Parker in the roles originally filled by the late Hal Skelly and Barbara Stanwyck, the revival drew fairly solid reviews and prospects for a good run were in sight.

Other Revivals.—For the records, the year also saw Katharine Cornell and Sir Cedric Hardwicke come to town in a limited engagement of Shaw's "Candida"; Andrayev's symbolical melodrama "He Who Gets Slapped" was unsuccessfully revived by The Theatre Guild with Dennis King and Susan Douglas in the leading roles; Shakespeare's "The Winter's Tale" also put in an appearance under The Theatre Guild banner with Jessie Royce Landis, Florence Reed, and Henry Daniell heading the cast; the riotous Ben Hecht-Charles MacArthur comedy "The Front Page" received an excellent revival with a fine cast headed by Lew Parker, Arnold Moss and Cora Witherspoon but somehow failed to win strength at the box-office, and an all-Negro company headed by Ferdi Washington and Rex Ingram who proved unable to save Gilbert Seldes' version of the Aristophanes comedy, "Lysistrata."

DRAMAS

"Christopher Blake."—In addition to the Eugene O'Neill drama "The Iceman Cometh," 1946 saw seven important new dramas presented to New York's playgoing public. Of the lot, Moss Hart's "Christopher Blake" was a touching and deeply moving story of the travail of a 12-year-old youth caught in the snares of domestic tragedy. A bitter indictment against the effects of divorce on young children, "Christopher Blake" saw the emergence of young Richard Tyler as Broadway's newest star. In the highly demanding title role, young Tyler gave a brilliant account of himself and was, undoubtedly, Broadway's favorite young player by the end of the year. Word must be mentioned, too, of the intelligent acting of Shepperd Strudwick as the boy's father, and Martha Sleeper who, in the more complex role of the mother, gave the most sensitive and inspired acting of her career.

"Joan of Lorraine."—Ingrid Bergman, the Swedish-American screen star, returned to the stage in the new Maxwell Anderson drama, "Joan of Lorraine." Revolving about the story of a group of actors preparing to produce the play "Saint Joan," Anderson's latest work drew a parallel between the life of the saint and the modern-day world. Using a bare stage as a novelty, the play, thanks to the drawing power of the star, whose presence had sold out the house months in advance, was one of the most heavily sought after attractions of 1946.

"Another Part of the Forest."—Lillian Hellman was represented by a new drama, "Another Part of the Forest," a deplorably uneven story in which the authoress, apparently, was unable to determine whether she was striving for drama or melodrama. A fine cast headed by Mildred Dunnock, Patricia Neal, and Percy Waram were largely responsible for deluding the majority of the patrons into thinking they were seeing profound dramaturgy at work. That they were seeing nothing more than some fairly ordinary ten-twenty-thirty melodramatics seemingly has not impressed them, as the drama is continuing, at the time of this writing, to large audiences.

"Antigone." — Katharine Cornell and Gilbert Miller were responsible for "Antigone," adapted by Lewis Galantière from the French of Jean Anouilh which, in turn, was adapted from the Sophocles tragedy. With its actors garbed in evening dress, this new version of "Antigone" was striking, effective theatre. Miss Cornell, as the tragic heroine, gave one of her most moving performances, although she was actually overshadowed by the masterly playing of Sir Cedric Hardwicke in the more expertly written role of the tyrant, Creon.

"The Magnificent Yankee." — Louis Calhern and Dorothy Gish undertook the roles of Supreme Court Justice Holmes and his wife in Emmett Lavery's sentimental biographical drama, "The Magnificent Yankee." Despite the dramatist's apparent inability to build strong dramatic moments, the play benefited from the superior acting of the stars and proved popular for all of six months.

"On Whitman Avenue."—Maxine Wood's "On Whitman Avenue" came hard on the heels of last season's best problem play, "Deep Are the Roots." Although the new drama lacked the tenseness of the earlier vehicle, it was not wholly without merit, for Miss Wood tackled the Negro-White problem head on. While she did not come up with a world-shaking play, she did manage to put together some effective scenes. The production, headed by Canada Lee, Ernestine Barrier, and Will Geer, foiled its enemies by achieving a run of several months before it was forced to close.

PROBLEM DRAMAS AND OTHERS

Four other problem plays arrived during the year, the best of the lot being the topical drama "Temper the Wind" by Edward Mabley and Leonard Mins. With Blanche Yurka giving an able performance in the leading role, the drama received strongly divided notices. The play, which dealt with the Allied occupation of Germany, was the last legitimate production of the year and, at last report, was expected to make a fight for survival. As for the others, Don Appell's "This, Too, Shall Pass" concerned itself with the Jewish question; Robert Ardrey's "Jeb" and Abram Hill's "Walk Hard" both took up the cudgels in defense of the Negroes.

The year's remaining dramas were disappointing. They included Maxwell Anderson's "Truckline Cafe," which drew notices so bad that the producers took space in the local newspapers to heave one back at the critics; "Flamingo Road," from the pens of Robert and Sally Wilder; "Obsession," by Jane Hinton, which served as a *tour de force* for Eugenie Leontovich and Basil Rathbone who comprised the entire cast; "Hear That Trumpet!," a short-lived offering from Orrin Jannings; Thomas Job's "Land's End," a dreary adaptation of the novel *Dawn in Lyonesse,* with Shirley Booth, Minnie Dupree, and Helen Craig; "No Exit," a French drama by Jean-Paul Sartre adapted by Paul Bowles and featuring screen personalities Ruth Ford and Annabella and introducing the Parisian actor, Claude Dauphin; and "The Duchess of Malfi," an adaptation of the Elizabethan drama by John Webster containing a fine performance from its star, Elisabeth Bergner.

COMEDIES

General.—At the end of 1946, the score-card for comedy attractions read six hits and 13 failures, hardly a notable record. To look at the more pleasant side of the picture, all of the six comedies which fared well with the press were pleasant. There will be little contesting the fact that Garson Kanin's "Born Yesterday" was the most enjoyable comedy of the season. A spry and deftly written satire on Washington politics, the piece bore some resemblance to last year's "State of the Union" although, actually, "Yesterday" was a better play. The vehicle served as a springboard on which two bright new talents, those of Judy Holliday and Paul Douglas, were launched. Miss Holliday, as the Dumb Dora given a Pygmalion treatment, and Mr. Douglas as the millionaire junkman, contributed performances of high comedic ability.

"Years Ago."—Ruth Gordon who is, incidentally, Mrs. Garson Kanin offstage, was absent from the theatre again this year in an acting capacity, but compromised by submitting her pleasant comedy about her early life called "Years Ago." Mr. Kanin attended to the staging, which embraced a cast including Patricia Kirkland as the young Ruth Gordon, and Florence Eldridge and Fredric March as Ruth's parents.

"Happy Birthday" and Others.—The other four successful comedies were vehicles, deliberately constructed for a definite star. Thus, Anita Loos' "Happy Birthday" snared the services of Helen Hayes to lend luster to what was, basically, a rather thin comedy. Clifton Webb contributed no end of charm to the leading role of Noel Coward's minor romp "Present Laughter." Alfred Lunt and Lynn Fontanne gave a pair of sparkling performances in the Terence Rattigan comedy "O Mistress Mine!," while Ina Claire made a most welcome return to the footlights as the heroine of George Kelly's bright comedy "The Fatal Weakness."

COMEDY FAILURES AND NEAR-FAILURES

Walter Houston made one of his rare stage appearances in "Apple of His Eye," a dreary comedy by Kenyon Nicholson and Charles Robinson, but not even the ingratiating performance of that able actor could prevent the play from its preordained trip to the storehouse. The wonderful Bobby Clark, for a few weeks at least, made merry with his free adaptation of Molière's comedy "The Would-Be Gentleman"; Harry Segal's comedy "Wonderful Journey," familiar to film-goers as "Here Comes Mr. Jordan," was put on for a few performances but failed to make the grade, and that fabulous road turkey "Maid in the Ozarks," from the pen of one Claire Parrish, bobbed up in

New York in the midst of the summer heat to find both press and public strangely chilled.

The year's other comedies, none of which managed to stay around very long, were Vincent McConnor's "A Joy Forever," with which Guy Kibbee was lured back to the stage; William Roos' adaptation of the novel *January Thaw* by Bellamy Partridge; A. B. Shriffrin's "I Like It Here," featuring the Continental comedian, Oscar Karlweis; Bella and Samuel Spewack's "Woman Bites Dog," containing the acting services of Ann Shoemaker and Taylor Holmes; N. Richard Nash's supposed satire on Shakespeare called "Second Best Bed," which gave Ruth Chatterton the worst role of her career; Frederick Kohner's and Albert Mannheimer's rubbish known as "The Bees and the Flowers"; "Loco" by Dale Eunson and Katharine Albert which introduced Jean Parker of the film industry to a Broadway audience; and Henry R. Misrock's "A Family Affair" with John Williams and Ann Mason. A late entry was "Lovely Me" by Jacqueline Susan and Beatrice Cole, which secured the talents of Luba Malina, whose perspicacity had kept the operetta "Marinka" running for several months last season. "Lovely Me" was still on the boards at the end of the year.

MUSICALS

"Annie Get Your Gun."—As compared to other seasons, there was relatively little activity in the musical field and, with few exceptions, the offerings were far from distinguished. Of the three best musicals of the year, only the Irving Berlin-Herbert and Dorothy Fields show, "Annie Get Your Gun" proved to be permanently popular. In fact, this turned out to be the year's top new musical, and in it Ethel Merman took the town by storm. "Annie," at the time of this writing, still is playing to capacity houses at every performance.

"Lute Song," a love story with music, was the most beautiful theatrical production seen in many years. Designed by Robert Edmond Jones and lavishly produced by Michael Myerberg, "Lute Song" somehow failed to capture a Broadway public satiated with musicals which made little or no demand upon their imagination. The play was kept running for several months only because of the courage of its sponsor and with the expected financial loss. Both Mary Martin and Dolly Haas, who played the starring role at different times during the engagement, were outstanding.

"Around the World."—The Mercury Theatre and Orson Welles contributed "Around the World," one of the most amusing extravaganzas to come along in some time. Based fleetingly on the Jules Verne novel, *Around the World in 80 Days,* the production boasted everything from a Chinese circus to a slide-for-life and, of course, that well-known kitchen sink. The notices for the spectacle were mixed, and, despite an attempt to push it along, the show was forced to close after a short run. Welles, in a variety of disguises, and the suavely amusing Arthur Margetson, helped make this particular theatrical trip around the world most enjoyable.

"Park Avenue."—In line with Margetson, however, it should be noted that he doesn't have to wait long "between engagements." A few months after the Welles' fiasco, he found himself working in the latest George Kaufman-Nunnally Johnson offering, "Park Avenue." While the musical found Kaufman in somewhat better form, it still lacked importance. A satire on the foibles of the Park Avenue divorce set, the vehicle was almost totally without sustained humor, and the music Arthur Schwartz supplied for the occasion was hardly up to his best. Mr. Margetson, however, and a personable supporting cast headed by Leonora Corbett, Marthe Errolle, and Ray MacDonald managed to keep the attraction going for a time, but the closing notice was up before the year was out.

"Beggar's Holiday," a musical-comedy based on "The Beggar's Opera," opened toward the close of the year to mixed notices, and its fate was somewhat uncertain as this volume went to press. A large and able cast headed by Alfred Drake of "Oklahoma!" fame, and Zero Mostel, was primarily concerned in the goings-on.

"St. Louis Woman" was a handsomely mounted item featuring a lively all-Negro company headed by Rex Ingram, the Nicholas Brothers, and the lovely Ruby Hill. Rouben Mamoulian, who had piloted both "Oklahoma!" and "Carousel" into public favor, seemed unable to keep this attraction on the move, despite hard work on the part of the cast. The play was kept running at a loss for a few months until the summer heat arrived and spelled "finis."

"If the Shoe Fits."—Of the instant musical failures, only one, "If the Shoe Fits," had anything to recommend it. In that offering, the British comedienne, Florence Desmond, cavorted and pranced and created impressions of stage and screen stars that were among the funniest ever seen on a Broadway stage.

"Nellie Bly" boasted the services of the celebrated comic team of William Gaxton and Victor Moore, while "The Duchess Misbehaves" had as its featured performer the Audrey Christie remembered for her vitriolic acting a year or two back in "The Voice of the Turtle." Both, however, failed rapidly. The last musical entry for the year was "Toplitzky of Notre Dame," which took up somewhat doubtful residence as 1946 drew to its close.

REVUES

"Call Me Mister."—The most successful revue for 1946 was the ex-G.I. offering, "Call Me Mister." Although the attraction was not without its good points, this observer could not but notice that both press and public, alike, leaned over backwards to shower praise upon material which, at best, could be termed only mildly amusing. The most entertaining members of the cast turned out to be Betty Garrett, featured singer and comedienne, and the Negro tenor, Laurence Winters. The show, as intimated, caught on with the public and still is high on the list of Broadway's favored attractions.

"Three To Make Ready."—Regardless of its defects, the revue known as "Three To Make Ready," was more professional in both style and tone. While neither its sketches nor its music was exactly on the memorable side, Ray Bolger, with the support of the amusing Brenda Forbes, kept the vehicle running for almost a year. Although scheduled to wind up its run early in 1947, "Three To Make Ready" was forced to close earlier than planned owing to the illness of its star.

OPERETTAS

Operetta fanciers experienced bad luck during 1946. All that the theatre could offer was a musty item called "Yours Is My Heart," sponsored by Arthur Spitz, and Edwin Lester's presentation of "Gypsy Lady."

Of the two, "Yours Is My Heart" was the better, owing to the presence in its cast of the noted Austrian tenor, Richard Tauber, and the former Metropolitan Opera soprano, Stella Andreva. Tied to the production, however, was a dreadful story about a Chinese prince who falls in love with a Parisian singer, and tied to that was a comedian who made one long for the reopening of New York's burlesque houses, at which only that particular brand of comedy would be tolerated. Tauber, however, who was making his American legitimate theatre debut, was in good voice, and his singing of the title song in a variety of languages was most pleasing, as was the true soprano voice of the talented Miss Andreva. Whatever chances "Yours Is My Heart" may have had to remain on the scene disappeared when Tauber came down with laryngitis and was forced out of the play.

"Gypsy Lady" was a garbled rehash of two Victor Herbert operettas, "The Fortune Teller" and "The Serenade," containing pleasant enough music from both shows. There, however, the good things came to an end, and the featured comedian and the bookwriters once more got to work. After a brief spurt at the box-office, attendance dwindled, and "Gypsy Lady's" management decided to take the affair over to London, possibly under the assumption that that city's dramatic critics are more gullible than those of New York's.

MELODRAMAS

The best the theatre could produce for the blood-and-thunder addicts was a mild, but not entirely hopeless, melodrama from Ben Hecht and Charles MacArthur called "Swan Song." While the play's direction left much to be desired in the manner of tempo and timing, the play managed to attract enough patrons to keep it running, even at a loss, for the summer season. The acting company, headed by 13-year-old pianist Jacqueline Horner, Mary Servoss, and Scott McKay was uniformly good.

Percy Kilbride, a pleasant character actor, found himself enmeshed in the "heavy" role of Marie Baumer's "Little Brown Jug." Entirely miscast, Kilbride worked to generate a few thrills, but both script and director were against him. He was supported by Katharine Alexander, in her first stage role in several years, Marjorie Lord from the cinema, and that busy-man-about-the-playhouses, Arthur Margetson.

There were three other attempts at melodrama during the season. "The Dancer," by Milton Lewis and Julian Funt, tried to draw a parallel between the life of Nijinsky and the story of a mad ballet dancer. Another batch of melodramatic twaddle was hurled at the heads of New York's first-nighters in Agatha Christie's "Hidden Horizon," which was hidden permanently from view after 13 showings. Dennis Hoey contributed "The Haven," a penny-dreadful which disappeared after five performances flat.

MISCELLANEOUS

Shortly before the summer doldrums set in, Sonja Henie and Arthur M. Wirtz hit upon the brilliant idea of installing another ice show at their Center Theater. Although they called it "Icetime," there was so little difference between the present exhibit and its three predecessors, that it was impossible to tell where one left off and the other began. The latest exercise in iced monotony proved, as usual, a potent lure with the summer crowds and still is turning over a nice profit, all of which should make the producers most comfortable.

Ben Hecht, whose season had already been active, what with the revival of "The Front Page" and the engagement for "Swan Song," next sent along a frank and unashamed propaganda pageant labeled "A Flag Is Born." Sponsored by The American League for a Free Palestine and with a cast headed by Paul Muni and Quentin Reynolds, the attraction proved popular with a large section of the public, and though intended originally as an 8-week affair, did not ring down its final curtain until almost three months later than planned.

The year's only fantasy was a well-meaning item called "Mr. Peebles and Mr. Hooker" by Edward E. Paramore, Jr. Despite good intentions, this old-wives' story of the age-old battle between God and the Devil never had a chance, despite the acting performances of Howard Smith and Rhys Williams, who appeared in the title roles.

CITY CENTER PRODUCTIONS

New York's cut-rate citadel of culture saw only two productions on its stage for 1946. Early in the year, a limited revival of the operetta "The Desert Song" was produced with a company including Jack Goode, Dorothy Sandlin, and Lester Matthews, while in April the still-popular and, incidentally, still-excellent Billy Rose presentation of "Carmen Jones" came back to the Center for a few weeks. For the greater part of the season, the house was given over to showings of the British film version of Shakespeare's "Henry V" starring Laurence Olivier. The theatre's plans for 1947 call for a return engagement of John C. Wilson's musical success of a season or two back, "Bloomer Girl."

MOTION PICTURES

By Thomas M. Pryor
Motion Picture Department, *The New York Times*

LABOR PROBLEMS

Labor problems took top billing in Hollywood during 1946 and artistic endeavor fell off perceptibly while rival labor unions fought a finish fight and management stood more or less on the sidelines, though not entirely in the role of the innocent, aggrieved victim. For while the strike of studio carpenters, prop men, set designers, and other craft workers grew out of a jurisdictional battle between the Conference of Studio Unions and the International Alliance of Theatrical Stage Employes (both, incidentally, belong to the American Federation of Labor), the studios elected to go along with the more powerful IATSE. Aside from whatever political considerations this decision reflected (the Hollywood air was fouled by charges that Moscow agents were behind the CSU), the producers' strategy followed sound business reasoning. By averting a rupture in relations with the IATSE, the studios prevented the strike issues from attaining calamitous proportions, for the IATSE, which also controls the projectionists in movie houses throughout the country, could cut off Hollywood's source of income overnight by calling out the "booth" men, thus forcing theatres to close.

As the year ended there was no indication that the issues which precipitated the strike—it began in September—were close to settlement. Studios were operating, though not with customary smoothness, with the aid of strike-breakers provided by the IATSE. Violence was more pronounced during this strike than on previous occasions. Battles frequently broke out between pickets and the consolidated forces of the local municipal and studio police, and homes of non-striking union members were bombed on at least two occasions.

STRIKE ISSUES

The strike was actually a continuation of the conflict between the unions for control of set work, which began in 1945 and resulted then in an eight months' strike. In December, 1945, an AFL arbitration award sought to divide set work between IATSE members and carpenters of the CSU. This resulted in a truce which lasted until the following September when the CSU members refused to work on sets built by the IATSE. The CSU men then were discharged by the studios. In November the strike issues were further aggravated by the CSU's demand for a 20 per cent wage increase.

That the strike was costly to the industry was freely admitted by studio executives, though no responsible source would estimate the over-all amount of the loss. The producers who were caught with uncompleted pictures filmed in Technicolor were, however, the hardest hit, when the technicians at the Technicolor plant, staged a surprise strike in October in defiance of their parent union. The laboratory technicians, numbering approximately 1,500, comprise IATSE Local 683. As a result of this action, David O. Selznick could not release his $5,000,000 production, "Duel in the Sun," for the Christmas holiday season as scheduled. Several other expensive productions also were held up.

PRODUCTION INCREASE

However, it is interesting to note that the combined output of the studios during 1946 totaled 405 films, or an increase of eight per cent over

1945. Many of the pictures released had been made as long ago as two years, but had been held on studio shelves due to the longer runs theatres have been giving pictures since 1943.

ARTISTIC QUALITY

In this respect, it is difficult to compare the quality of the pictures made during 1946 with that of the preceding year or two when studios still were operating under wartime conditions. Yet, for critical purposes, one has the right to form a judgment on the basis of the quality of pictures exhibited during a given year, regardless of the time and circumstances of their actual filming.

Perhaps the most striking commentary is to be found in a study of the Ten Best picture selections of newspaper critics and reviewing groups all over the country. The weekly *Variety,* long regarded as the foremost trade publication in the entertainment world, reported that a survey showed a "preponderance of foreign films on the annual 'Ten Best' lists." *The New York Times,* for instance had only five Hollywood productions on its ten-best list. The National Board of Review of Motion Pictures placed four foreign-made pictures at the top of its ten-best selections. All of which should be taken by Hollywood as definite indication that its product for the year was hardly as good as it could, or should, have been.

BRITISH COMPETITION

The strongest competition came from the studios of England. British pictures reached Broadway theatres with greater regularity than heretofore, and the good ones found appreciative audiences. Around the country, they were more widely exhibited than ever before. "Henry V," the London-made picturization of the Shakespearean drama, was acclaimed by the National Board as the outstanding screen accomplishment of the year. Significant, too, is that, of the three pictures from which the New York Film Critics made their choice of the year's best, two came from English studios, "Henry V" and "Stairway to Heaven," which in London was titled "A Matter of Life and Death." Had not Samuel Goldwyn come to the rescue of the American industry late in the season with his splendid topical drama, "The Best Years of Our Lives," the Critics' award would have gone to "Henry V." It lost out only by a vote of 6 to 12 in favor of the Goldwyn contribution.

Only the film trade publications, which depend entirely on movie company advertising for their existence, had comforting words for the studio overlords, assuring them that the newspaper critics were anti-Hollywood and didn't know what they were talking about anyway, but Samuel Goldwyn, who most certainly isn't anti-Hollywood, felt the need to caution his colleagues against their intellectual isolationism in a blistering, public pronouncement. Hailing the competition from Britain as a healthy development, Mr. Goldwyn said it "may provide the threat that Hollywood needs to stir itself out of its fat-cat complacency." Commenting on the generally poor quality of pictures, the producer declared "Hollywood has run dry of ideas. It is living on borrowed time—and borrowed ideas from the past—and that is why, with few exceptions, every picture reminds you of a hundred other pictures." Mr. Goldwyn put his finger on the most glaring deficiency of our movies with those last few thoughts.

THE TEN BEST

Now, in the light of this background, it seems appropriate to consider the Ten Best pictures as selected by Bosley Crowther, motion picture critic for *The New York Times.* The pictures, listed according to the order in which they opened at Broadway theatres, follow:

"Open City," written by Sergio Amidel and F. Fellini; directed by Roberto Rosselini and produced in Italy by Excelsa Films. This grim and electrifying drama of underground resistance to the Nazis in Italy was the most intense and disturbing picture of the year. Crudely produced, it had, however, a rare quality of artistry which derived from the fervor of its makers and from profound performances by Aldo Fabrizi, Anna Maganani, Marcello Pagliero, and many others.

"Road to Utopia," written by Norman Panama and Melvin Frank; directed by Hal Walker and produced by Paul Jones for Paramount. Fine and finished clowning of a swift and expansive sort is always welcome on the screen—and that is what this antic had. A titantic burlesque on brawny adventure pictures, it was in the classic style and was riotously played by those old partners, Bing Crosby, Bob Hope, and Dorothy Lamour.

"The Green Years," written by Robert Ardrey and Sonya Levien from the novel by A. J. Cronin; directed by Victor Saville and produced by Leon Gordon for Metro-Goldwyn-Mayer. A wealth of colorful incident tastefully presented, and performances nicely tuned to the humor and sentiment of human nature, made this visualization of a Scottish family story one of the year's best films. Charles Coburn, Tom Drake, Dean Stockwell, and Hume Cronyn were excellent in the cast.

"Henry V," written by William Shakespeare and edited by Laurence Olivier and Reginald Beck; directed and produced in Britain by Mr. Olivier for Two Cities Films. For the first time, in this brilliant picture, a play by Shakespeare was brought to the screen with all the color and sweep of a spectacle, the subtlety of character and the poetic eloquence inherent in the works of the Bard. Mr. Olivier's robust performance in the title role was finely supported by Robert Newton, Leslie Banks, Renee Asherson, and Frances Lister, among others.

"Notorious," written by Ben Hecht; directed and produced by Alfred Hitchcock for David O. Selznick and RKO-Radio. Although a basically conventional spy story, this romantic melodrama became a highly suspenseful and consistently fascinating screen entertainment through expert writing, direction, editing, and finished performances by Ingrid Bergman, Claude Rains, Cary Grant, Leopoldine Konstantin, and Louis Calhern.

"Brief Encounter," written by Noel Coward; directed by David Lean and produced by Mr. Coward in England. A fine talent for simple dramatic expression, both visual and verbal, was displayed in this affecting film about a clandestine and unfulfilled romance between an English housewife and a small-town medico. Celia Johnson and Trevor Howard revealed uncommon naturalness and sensitivity in the principal roles.

"The Well-Digger's Daughter," written, directed and produced in France by Marcel Pagnol. Despite the language barrier, this five-year-old French film, only this year released in this country, gave off a delicious glow of nimble wit and a shrewd understanding of human nature in its story of a peasant of Provence who comes to love his illegitimate grandchild. The old man was superbly played by the late Raimu, while Fernandel, Josette Day, and Charpin were winning in other roles.

"The Best Years of Our Lives," written by Robert E. Sherwood from a story by MacKinlay Kantor; directed by William Wyler and produced by Samuel Goldwyn for RKO-Radio. This multi-character comedy-drama of homecoming war veterans, their families and friends was, in its composition, its perceptive direction, and its performance throughout, the best all-around film of the year from Hollywood. Fredric March, Dana Andrews, Teresa Wright, and a young man named Harold Russell shone in the cast.

"My Darling Clementine," written by Samuel G. Engel and Winston Miller from a story by Stuart N. Lake; directed by John Ford for Twentieth Century-Fox. The inexhaustible potentialities of the Western film genre—the vivid action, the picturesqueness of character, and the pictorial magnificence of locale—were eminently realized in this fluid rendition of the standard frontier-marshal theme. Henry Fonda, Victor Mature, and Walter Brennan carried the acting honors.

"Stairway to Heaven," written, directed and produced in England by Michael Powell and Emeric Pressburger for J. Arthur Rank. For its qualities of imaginative conception and cinematic inventiveness, this delightful romantic fantasy about a flier, who has hallucinations of the Beyond, deserves the highest recommendation of any film of the year. Sensitive and mature performances by David Niven, Roger Livesey, Kim Hunter, and Raymond Massey enhance its incomparable charm.

BOOM PROFITS

While doleful reports on the quality of American pictures were being written at the year end, the producing companies were, strangely enough, adding up phenomenal profits. The *Variety* statisticians were predicting, on the basis of earning statements of the major studios, record net profits of $120,000,000 for the eight major companies above. Part of this can be attributed to a slight increase in basic theatre admission prices throughout most of the country. Perhaps an even more influential factor is to be found in the practice, which reached new heights during the year, whereby theatres jockeyed price scales according to the demand for tickets. This was especially noticeable at the big first-run theatres, particularly in New York, where matinee admissions frequently exceeded $1 and evening prices reached as high as $2.40, even at houses which had no supplementary stage attractions. Public grumbling over these conditions was pronounced, yet not enough persons remained away from movies to make the protest effective.

PRODUCTION COSTS

When confronted with charges that admission prices were excessive, producers countered with the claim that production costs alone had risen approximately 25 per cent over the previous year, and, on top of this, they argued that distribution expenditures also increased by an additional 25 per cent, making an over-all rise in costs of 50 per cent.

The higher picture grosses were attributed mostly to increased attendance. The industry blithely set the attendance figure for the United States at approximately 90,000,000 weekly. Yet more conservative estimates claimed that about 70,000,000 would be more accurate. In any event, no one could explain quite satisfactorily how the staggering profits were possible in view of reports that box-office receipts had slumped about 20 per cent in the closing months of the year.

INDEPENDENT PRODUCTION

Industrywise, one of the more significant developments was the steady growth of independent production during 1946. Roughly 50 such new companies were announced either by stars, directors, writers, or producers who decided to break away from the majors. Moreover, profit-sharing deals with acting, writing, directing, and producing talent were entered into by every major studio, with the exception of Metro-Goldwyn-Mayer. It is estimated that about 25 per cent of Hollywood's 1946 pictures were made independently, and indications are that there will be no appreciable slackening of this trend—at least not for the first six months of 1947. However, the decline in box-office revenues, coupled with the still rising cost of production, is expected to cause investors to tighten their purse strings. In fact, the major companies wound up the year by starting to pare expenses. Metro-Goldwyn-Mayer reportedly was looking to lop $6,000,000 from its 1947 budget.

CONSENT DECREE

Moreover, the final consent decree, handed down on Dec. 31 by the three-judge Federal statutory court in New York, presages wide changes in the industry's picture selling methods during 1947. The decision in the eight-year-old anti-trust suit filed by the Department of Justice against the eight principal producing and distributing companies was written by

United States District Judges John Bright and Henry W. Goddard and Judge Augustus N. Hand of the Circuit Court of Appeals.

Highlights of the decree are that it enjoins the defendants from various trade practices, including fixing of minimum admission price agreements; prohibits preferential treatment of exhibitors and provides that any exhibitor may demand competitive bidding for pictures (the distributors may reject all bids, but in event an award is made the picture must go to the highest bidder); and compels distributors to divest themselves of theatre interests in which their holdings are more than five per cent but less than 95 per cent. The court allows two years for compliance with this provision of the order.

The court stayed operation of the judgment for 60 days, or until March 1, 1947. In the event an appeal is made, which appeared certain at this writing, another 30-day period would be granted "to enable any appellant to move before the Supreme Court for a stay in respect to any portion of the judgment from which an appeal has been taken."

CORPORATE CHANGES

The most important corporate change involved the merger of Universal Pictures and International Pictures, the latter an independent company headed by William Goetz and Leo Spitz, to form Universal-International. As part of the new set up, the J. Arthur Rank Organization of England became more closely aligned with Universal-International. Rank has long been a large stockholder in the parent company, Universal Pictures, Inc.

The only other major development was the establishment by David O. Selznick of his own producing and distributing organization, The Selznick Releasing Organization. This followed Selznick's break, late in the year, with his owner-partners in the United Artists Corporation, Mary Pickford and Charles Chaplin. In taking his product away from United Artists and forming his own company, Selznick declared that the move would not affect his one-third ownership in United Artists. The company indicated that it would take Mr. Selznick into court to determine whether his action constituted a breach of contract.

DEVELOPMENT OF 8MM AND 16MM PICTURES

Universal, also in association with the Rank interests, formed a separate corporation, United World Films, to produce and distribute 8mm and 16mm pictures of an educational, religious, and entertainment nature for both the home film and the non-theatrical film markets. As a first step, United World purchased the Filmosound Library, containing 6,000 subjects, from Bell & Howell, and, later, it purchased control of Castle Films, the largest producing-distributing company servicing home picture enthusiasts.

It is estimated that there are close to 400,000 8mm and 16mm silent and sound movie projectors now in operation in this country, owned either by individuals or groups, and that the audience for these pictures is well over 20,000,000 a year. The demand for these sub-standard size projectors has not yet reached the saturation point, and it is expected that within five years there will be at least 2,000,000 such projectors in use in this country alone. All of which indicates the emergence of another sizeable movie industry apart from Hollywood.

NEW TALENT

In the new talent department, Hollywood drew heavily during 1946 on established English players. Among those brought to this country were Rex Harrison, who made a big hit in Twentieth Century-Fox's "Anna and the King of Siam," Ann Todd, Phyllis Calvert, Peggy Cummings, Lilli Palmer (Mrs. Rex Harrison), Patricia Roc, and Pat Kirkland, among others. Also imported was the Swedish actress, Viveca Lindfors.

Among new or comparatively new

players introduced by Hollywood and who showed considerable promise were Larry Parks in "The Jolson Story," Celeste Holm in "Three Little Girls in Blue," Jeanne Crain in "Margie," John Lund in "To Each His Own," and Burt Lancaster in "The Killers." Also there were Nancy Guild, Douglas Dick, Dorothy Patrick, Richard Hart, Cathy Downs, Barbara Bel Geddes, Conrad Janis, and the child actress Sharyn Moffett.

FOREIGN REPORT

There was both good and bad news for the American industry abroad during 1946. On the credit side was the negotiation of a new trade agreement with France and also a beneficial tax treaty with that country; the lifting of the double tax in Great Britain, and, as the result of this country's loan to England, there was assurance that remittances on earnings in England would continue to flow into the coffers of Hollywood companies. After a year-long tug-o'-war with the Dutch film monopoly, the Bioscop Bond, the Motion Picture Export Association, negotiated a settlement. Now Hollywood pictures are once more doing business in The Netherlands. In eastern Europe, however, state film monopolies continued in force, largely as a result of Russian influence.

Hollywood was particularly disturbed at the continuation through 1946 of what it choose to term an anti-American campaign on the part of the British press and radio. This feeling stemmed from the fact that British criticism of films stiffened considerably, and, moreover, box-office figures indicated plainly that the popularity of American pictures was not what it used to be. In several instances, British-made pictures, which compared favorably with their opposite Hollywood types, showed far greater earning power than did the imported product. Hollywood, following its own peculiar logic, naturally concluded that the British press had succeeded in prejudicing His Majesty's subjects against American pictures.

Thus, Hollywood went into 1947 with some grave misgivings about how its product would fare in Great Britain, its biggest foreign market by far during the year.

DIVISION XXVII

EDUCATION

ELEMENTARY EDUCATION

By Wilma Leslie Garnett
Associate Professor, Kent State University

THE TEACHER SALARY QUESTION

It may be prognosticated that 1947 opens a new era for elementary education. Unmistakable signs of the new era prevail. Even the growing pains are now acute. For example, the problem of teachers' salaries is a cause of suffering in certain parts of the country. In St. Paul the largest and longest teachers' strike involved 1,160 teachers and 30,000 pupils. This strike was, ironically, negotiated by an artisans' unit of the American Federation of Labor. Teachers are taking time out to look after their economic welfare. There will be considerable pain resultant as teachers the country over make demands on the national, state, and local pocketbooks, trying to wring out just payment for the great service they render. The salary problem is only one of the growing pains implying the birth of a new era in education. Something must be done, and shortly, to alleviate the salary pain or a more serious condition of teacher shortage will make malignant inroads on the bulwark of democracy. That condition is so serious now that persons less sanguine than the Pollyanna philosophers fear that results may prove fatal to the good of this country. How fatal, one may gather from these figures: 60,000 teaching jobs were not filled this year; at least 350,000 teachers have left the profession for more lucrative employment since 1939. There are now 19,000,000 children in the elementary schools; by 1954, there will be 23,200,000. Teachers in greater numbers than ever before are needed to educate the elementary school children of the United States for the work of tomorrow.

Adequate salaries will be needed to attract excellent teachers. At present, a teacher makes on an average, $1,900 a year. Compare that with the common laborer's average of $2,400 a year and the bricklayer's average of $4,500 (in New York) to $3,250 (in Charlotte). These averages make no allowances for overtime for which the laborers are paid. (See *Cleveland Plain Dealer,* Dec. 30, 1946.)

Some alarm has been felt about the fact that teachers' strikes thus far seem to have been incited by the handworking unions. Those alarmed say that the teachers are taking a short way out and that they will sorely regret doing so. They argue that, in the long run, the teachers would profit more by forming their own organization and launching a popular campaign to gain their ends.

California is aware of the crucial shortage of teachers and has opened a recruitment program. In that state, with its excellent record, there are 14,000 out of 50,000 teachers on substandard (emergency) certificates. In some states conditions are much worse. For example, in one of the states usually holding high standards along lines of certification, one teacher out of ten is teaching on a standard certification basis. Recruitment programs are sorely needed, coupled with assuredly good salaries. California adopted on Nov. 5, 1946 an amendment to the State Constitution which provides $2,400 as a minimum salary for all regular teachers. This is the minimum advocated by the National Education Association and other groups. Several states are taking corrective action on this grave matter of salaries in the hope that good people may again be drawn to the teaching profession.

SCHOOL FINANCING

The government has the primary responsibility in giving direction to school expenditures. Federal, state. and local governments have taken shares in the costs, the states bearing the greatest part of the burden.

The ten recommended goals in school finance widely achieved are: total amount of bonded indebtedness regulated; local taxes, except for debt service, applied to general educational program; state revenues sufficient to pay state appropriations to education in full; requirements for participation in state funds equitable; local school systems with authority to issue bonds; local school units to levy general property taxes for school purposes; state appropriations sufficient to meet state's share of cost of education; school funds expended without discrimination; requirements for participation in state funds objective; and local administrative units free to seek and develop progressive educational methods. ("School Finance Goals," National Education Association, *Research Bulletin,* Vol. XXIV, No. 3, October, 1946.)

TEACHER RECRUITMENT ARGUMENTS

Effective recruitment will have to include some promise of freedom from want in old age. At present, only one state offers no old-age protection. Joint-contributory reserve systems are provided in 98.5 per cent of the states. These systems will have to be augmented considerably to make them attractive as recruitment arguments.

Certain major trends show up in the professional literature of the day; what is more significant, the trends are being treated in the newspapers, news magazines, and magazines from almost every group of thinkers in the country. The country is more education-conscious than ever before. The G. I. Bill will, by its moral power, make better the education for the elementary school child of today and tomorrow. The women who went beyond their homes to work in the war period will demand more and better education for their children. One might say that a good outcome of the past war is this interest generated in making education count in establishing for this country the evolving American way.

EARMARKS OF THE GOOD SCHOOL

The earmarks of the good school today, as a demanded expression of the present trends of philosophy backing up elementary education are:

The school is as good as the people of the community make it.

The school is for the children, but is a communal institution in which children, administrators, teachers, board members, service people. and all other members of the community interested work together in a search for truth. The school changes the community. The key persons in the school are the teachers. It is important that the teachers of the most important people in our country, the elementary school children, be well educated and be cultured individuals.

It is the obligation of the school to stimulate as much creative thinking as possible. The country in which constructive, creative thinking is done has a chance of extended survival.

A supplementary exposition of why American schools should be exponents of the foregoing philosophy is of more than momentary significance. American schools must be good to promote international welfare, not mere national good. America may give good to the world if it has developed that good; America may be the recipient of worthy ideas developed by other countries if aware and tolerant of those ideas. The schools of America must tie into the program of UNESCO, as it is developed, for that program is an expression of interest in international well-being. Here are some of the phases of the UNESCO program being devised now to take into account the elementary school child. Under the UNESCO program such proposals as these are being implemented: use of films and radio in classrooms to promote international understanding; exchange of good books and periodicals for children; exchange of teachers and students; international circulation of newspapers; and International Ideas Bureau.

The main function of UNESCO is that of promoting the free flow of ideas by word and image through the free use of media of mass communication. In short, mass media are to be utilized for international exchanges of culture. Such exchanges, if effectively made, may well be substituted for exchanges of such political facts as may generate wars for the future. Let the next generation of thinkers (the elementary school children of today) be taught to exchange cultural ideas. For this reason, it is important to have the elementary school program incorporate phases of the UNESCO program and to implement those phases.

SCHOOL HOUSING PROBLEM

During the war years, school-housing became a severe problem in almost all areas of this country. Buildings deteriorated and could not be adequately restored. Equipment was insufficient when available in any quantity. Now the cry is for better housing, better equipment. Many new school structures will be erected, plans for which have been made during the past year or two.

Featured in many of the new elementary school buildings will be these ideas: modernistic design in architecture; each building suited to unique task and setting; flexibility in school building; beauty as essential for object lessons; effective landscaping; steel-liberated structures; machine-age standardization; communal service features. Buildings are reflections of culture. A community school for an average neighborhood—a school housing 1,000 children—should include classrooms, kindergarten, nursery school, auditorium, library, music rooms, art rooms, science rooms, offices, health center, lobby and lunch room, play room, toilets, gymnasium, out-of-door play grounds, and handball courts. As to lighting, heating, and ventilating, appropriate systems have been scientifically standardized by the acceptance of manufacturers' recommendations as made to reliable architects and builders in the various sections of the country.

The buildings as such should advance education's aims. Safety, sanitation, and comfort are considered as matters of course; the adjustment of the plant to improved teaching procedures and to the effective functioning of a philosophy of education that makes the school communal is a recognized essential of 1946-1947 planning. The school must be a place where important things are happening in the search for truth. Such a school will be functionally planned by teachers, parents, and children. The recommendations made by these citizens will be given scientific and artistic expression by school architects and builders.

Essential equipment and furniture, good seats, good desks, proper tables, sound and film equipment, musical instruments, typewriters, and the like will find their places in these schools. Scientific manufacturers will help educate the public to that, and money will be forthcoming for material goods in these new schools to result from the 1946 plans.

IMPORTANCE OF BOOKS

There is one type of material, a most important class that will not be provided for with such alacrity by the taxpayer. It is by far the most important of the items, for it is the material that touches the field of the spirit. Through it teaching is effected. We refer to books. Good buildings and fine equipment, even superior teachers, will not prove adequate if good books are lacking. Huge budgets for books of merit are asked by leaders in the field of elementary education. Cooperation with public libraries is sought. Teachers who know good literature for both adults and children will be able to advance this essential phase of the new teaching program. No other teachers can do it.

In this connection, note should be made of the guidance given by professional and literary magazines. Annotated book lists, highly selective, are presented from issue to issue in many of the magazines. *The Elementary English Review* is especially helpful in this respect, as may be gathered from a glance at well-written articles in two issues of the 1946 magazines. Such titles of articles as these appear: "Children's Books of the Year"; "The Christmas Spirit and Books"; "Biography for Young Readers"; "Vitalizing the School Library"; and "Our Library."

In the Young Folks Book Club, a new organization for children, young persons recommend books for children. The first four books chosen were: *Three Gay Tales from Grimm,* Wanda Gay, translator; *Peter Churchmouse,* Margot Austin; *The Moffats,* Eleanor Estes, illustrated by Louis Slobodkin; and *Mystery of the Secret Drawer,* Helen Fuller Orton, illustrated by Sandra James. The educators are becoming aware of an important truth. Children may be the best of critics in choosing their books for reading. Close cooperation with the library is assumed to be essential.

MAGAZINES AS FACTORS

If articles in magazines for parents be indications of the special interests parents have in the elementary education of today, the major interests are these: discipline of children; psychology of childhood; entertainment for children; play materials; nutrition; books for boys and girls; childhood norms—physical and behavior; the movies, the radio, teachers.

The topics listed below have been treated in many magazine articles of the past year: studies in child development; personality patterns; learning social skills; the individual, not the mass; challenge of music education; music in therapy; radio listening; rural education; transportation problems; overcoming racial prejudices; education in family living; children and their books; intelligence and testing for intelligence; making test results function in teaching; guidance possibilities; community health projects; community study; experimenting for better curriculums and for better courses of study; geography as background for international mindedness; supervision; the language arts program; speech disorders; speech training for all; language and behavior; communication; vocabulary building; spelling; reading readiness; problem solving in arithmetic; films in education; making movies; incidental learnings; learning curves; retention of concepts learned; influence of belief.

CHANGES IN INSTRUCTIONAL PRACTICES

Changes in instructional practices are not too easily discovered in this period. Poorly prepared teachers are retarding factors in progress upward along the most important lines, the instructional. Such lines of progress as appear in the professional articles and books for the year are in these areas, from a summary of which trends of improvement may be noted:

1. The interest in a health program, including the practice of good eating, is growing. Some educators realize that the school will have to point, if not dictate, the way to proper feeding of children.
2. Provision is being made for some out-of-door school life in science, as well as in play.
3. More musical education is being demanded, more instrumental work in the grades, also more music appreciation.
4. There is a stronger interest in geography as a field in which to study world-mindedness, or internationalism.
5. Some attention is being given to speech education as an essential phase of the language arts program.
6. The language arts unit is developing to embrace reading, speaking, writing, spelling, and dramatization.
7. Schools are providing a larger amount of individualized instruction than ever before.
8. Nursery school and kindergarten education is gaining support.
9. Exceptional child programs are developing.
10. A need is being felt for less spreading out into new activities. Rather, the feeling is growing in favor of thorough work in basic fields: health, culture, speech, science, and the fine arts.
11. By culture is meant an education in beliefs, that is, character education. As Erika Mann has well said: "The elementary child, too, needs character-building education."
12. Science and the humanities are gaining support.

CURRICULUMS

Three special demands are now being made upon the newly developed or developing curriculums for elementary schools: the first, in regard to home-making; the second, in regard to American history; the third, in regard to religious education.

Admittedly the home is the first agency of education. The school and the home of today are trying to articulate their programs through holding parent conference groups, giving parents representation on curriculum committees, making the school a cultural center for the community, urging school visitation by parents, featuring adult and child education for home-making. Many are the demands for education in home-making.

The children of the elementary school are in what Alfred North Whitehead calls the "Romantic Period" educationally. The call for more American history in the school program may be accepted in this period through the presentation of biography and historical fiction evaluated in terms of authenticated historical accounts. The better curriculums are making place for more of this type of teaching of American history.

A third demand in revising curriculums is in the field of religious education. Some assertions are being made to the effect that religious education must be made more accessible than it has been to all children. Religious leaders have published this platform as their policy-making set of standards for developing weekday church schools:

1. A year of planning before launching the program.
2. All religious groups working closely together.
3. Parents accepting their responsibility for the school and supporting it in every way.
4. Public-school officials co-operating heartily without controlling.
5. A representative and reliable weekday church school board continuously on the job.
6. A course of education in religion as well planned and implemented to its purposes as the courses in the public schools are to theirs.
7. Teachers as well trained for teaching religion as the public-school teachers are trained for their work.
8. A supervisor—trained, experienced, and religious—working with every school.
9. An expenditure per pupil (in proportion to the teaching time) equal to that for his public-school education.
10. The spirit as well as the letter of the law preserved in all relationships. (*International Journal of Religious Education,* June, 1944.)

OUTLOOK FOR ELEMENTARY EDUCATION

A recent article in *The New York Times* makes one feel hopeful about the outlook for education, especially elementary education, in this country. The review is by Benjamin Fine, who has given this hopeful heading for the review: "Business and Labor Leaders Consider Ways of Meeting Crisis in Nation's Schools." This caption is an expression on the positive side, for when Business and Labor cooperate on a problem as important as the crisis in this nation's schools, there will be some good results. With their demand that American children be taught the "industrial facts of life," there will, of necessity, be associated and brought to the foreground other demands. Their demands are backed by such arguments as these: education is an essential instrument in the expansion of commerce, industry and agriculture; money spent for education is an investment that can well be afforded in increasing measure when related to the improvement of local economic conditions; educational programs should be made to apply more directly to the community; and if we are to maintain the American tradition of private initiative as our economy expands, sound and immediate measures to improve our schools are necessary.

DELINQUENCY

When FBI Director J. Edgar Hoover comes forth with the assertion that unless better pay for teachers is forthcoming, the nation will invite greater juvenile delinquency. The younger the child, the more susceptible he is to character-building education, according to Mr. Hoover. The elementary school children may be kept from delinquency by well-qualified teachers. His assertion is: Our penny-wise and pound-foolish attitude toward our educational system is one of the tragedies of America.

(*Cedar Rapids Gazette,* Christmas, 1946.)

FREE TEXTBOOKS

The free textbook situation is increasingly encouraging in our country. At least 34 states make legal provision for requiring the provision of some free textbooks in the elementary schools. Almost all other states have permissive legislation on this point. The viewpoint is this:

"In those states supplying any or all textbooks the initial procedure has been to provide for the elementary grades first—frequently the lower elementary grades—and to expand the provisions in grade order. This is in accordance with the development of public education programs based upon the principle that the first essential is to insure elementary educational opportunities for all. It is also to be recognized that more pupils can be served by this procedure for the amount of money expended. In general, textbooks have been provided before other materials such as paper and pencils, which are regarded as consumable on initial issue, whereas textbooks are reissued and frequently made to serve in turn several pupils.

"The movement for free textbooks—and while more recent, for other instructional materials also—has been continuous, and also cumulative with respect to the articles supplied. The movement has in general not been interrupted by adverse legislative action or change in practice. The principle that free instructional materials are a condition for free, universal, public education for a democratic social order is apparently accepted in theory. In practice it is considered as a goal toward which at least some preliminary steps have been taken by all states." (Maris M. Proffitt, *State Provisions for Free Textbooks and Instructional Materials.* Bulletin 1944. No. 1. U. S. Office of Education.)

STATISTICAL

In conclusion, let us note the latest summary of statistics on state school systems, as given out by the U. S. Office of Education, in an effort to get our bearings for the program to come:

Estimated Population (Continental United States), 5–17 years of age, July 1, 1944	28,930,000
Enrollment	
Elementary grades	17,713,096
High school grades	5,553,520
High school graduates	953,254
Average daily attendance	19,602,772
Average number of days schools were in session	175.5
Average number of days attended by each pupil enrolled	147.9
Percent attendance is of enrollment	84.3
Average value of school property per pupil enrolled	$341
Supervisors, principals, teachers and other instructional staff	
Number	865,038
Aggregate Salaries	$1,494,506,929
Average Salaries	$1,728
Current expense (less interest)	
Amount	$2,293,337,099
Per pupil in average daily attendance	$116.99
Interest	$96,804,865
Capital outlay	$53,856,462
Number of pupils transported at public expense	4,410,362
Number of one-room one teacher schools	96,302
Income from taxation and appropriation	
Amount	$2,478,466,811
Percent from state	33.6*

* *Statistical Circular*, September, 1946. U. S. Office of Education.

CONCLUSION

Probably 1,000,000 teachers are needed for an effective program in the elementary and high schools. Even a call for a million will make recruitment a necessity. Federal, state, and local attention to this matter is needed. Salaries for elementary teachers should be established the country over at a $2,400 minimum. Federal aid may be necessary at the present time, but could be tapered off by legislative provision as the states are able to take hold.

Standards of certification can and should be held at a minimum of a four-year college training program as soon as possible. Salary, recruitment, colleges of training, and state departments of education must work cooperatively on this problem.

The United States Office of Education may well give active guidance as requested to do so, not merely consultant services. The nation needs that professional guidance. Dictation is not implied and would not be the result if the guidance given were strictly professionalized.

The nation must put up more money for elementary education; must demand well-qualified teachers; must ask for education in the important things of life as they concern elementary children; must see that character education, the fundamental, is given its rightful place as the schools of 1947 begin a program of elementary education stressing creative thinking with the next generation. That generation will be made up of the elementary school children of today.

SECONDARY EDUCATION

By Robert S. Gilchrist
Minneapolis Public Schools
and
Kenneth M. Peterson
Tenafly (N. J.) Public Schools*

ENROLLMENT

Approximately 6,200,000 students enrolled in Grades 9 to 12 in the school year 1946-47 in public and private schools of America. About 425,000 attend private and parochial schools. No marked changes in enrollments have taken place during the past three years. Data available separately for junior and senior high schools show reductions for junior high schools and increases for senior high schools. Senior high school students are returned from industry and the armed services, while at the junior high school level the low birth rates occurring between 1932 and 1936 caused decreases. Basic data showing the trend in public secondary education since 1900 and through 1943-44 are now available. The enrollment in public schools in Grades 9 to 12 was 519,251 in 1899-1900. By 1910 this number was nearly doubled, and by 1920, 2,200,000 were enrolled. By 1930, 4,400,000 were attending Grades 9 to 12 in the public schools. The upward trend continued until 1940-41, when 6,713,913 were enrolled. The war caused a decrease in enrollment from 1941-42 through 1943-44 at which time 5,553,520 were enrolled in Grades 9 to 12. (U. S. Office of Education.)

TEACHER CRISIS

In 1946 the teacher crisis in America alarmed laymen as well as educators. Sixty thousand teaching positions were unfilled during 1945-46. One teacher in ten held his position on an emergency certificate. The 108,000 emergency teachers could not meet even the lowest standards in their respective states. Only 15 states and the District of Columbia now require college graduation for a standard teaching certificate. In some areas high school graduation was sufficient preparation to meet legal teaching requirements. Since 1939, 350,000 teachers quit the profession entirely. Men teachers were reduced to only 15 per cent of the total number. Enrollments in colleges which prepare teachers were far below normal. The number of women in teachers' colleges dropped one-third from 1941 to 1943. The number of men teachers in teachers' colleges in October, 1945 was 13,000 as compared with 39,000 in the fall of 1941. In 1920, 22 per cent of all college students enrolled in teach-

* The writers made extensive use of the following in collecting information for the review; *The Clearing House*, *Bulletin of the National Association of Secondary School Principals*, *School Life*, *Journal of the National Education Association*, *School Review*, *Progressive Education*, and material supplied by the U. S. Office of Education and the American Council on Education.

ers' colleges; in 1930, 16 per cent; and in 1946, seven per cent.

The primary cause of the teacher shortage is low salaries. Low salaries were the result of many circumstances. Teachers' salaries have always been very inadequate. They were lowered further during the depression. Teachers' salaries were formerly not subject to Federal income taxes. Wartime inflation and post-war inflation have served to intensify the problem. For the year 1945-46, the estimated average teacher's salary in the United States was $1,950, while the minimum for professional employees in the Federal Government was $2,640.

In an attempt to meet the teaching crisis, the National Education Association sponsored a national emergency conference on teacher education and supply. Three hundred leaders representing professional, government, civic, and labor organizations attended the conference. Some of the major recommendations were: that a Commission on Professional Standards for Teacher-Preparing Institutions be established by the NEA; that Federal sources provide an additional $2,000,000,000 to meet educational demands for 1946-47; that the organized profession set up standards and policies in such matters as salary schedules, certification, requirements, and methods of procedure in the selection of teachers; that the profession require a five-year program of preparation for teaching which includes guided practical experience or active work with children; that educational opportunities be more nearly equalized; that a professional standard for teachers salary schedules be not less than a level of $2,400 a year for the beginning teacher with a bachelor's degree, with provisions for salary advances in recognition of experience and advanced preparation up to a maximum salary at a truly professional level.

A week later the NEA Representative Assembly in Buffalo passed unanimously a motion recommended by the conference establishing a commission on teacher education and professional standards charged with the responsibility of implementing the recommendations of the National Emergency Conference on Teacher Preparation and Supply. The new commission has before it the task of leading the teachers of America in the same kind of program through which physicians, dentists, lawyers, engineers and other organized groups have lifted the status of their professions in the life of the nation.

THE HARVARD REPORT

General Education in a Free Society, published by the Harvard Committee, has had a truly marvelous appeal to educators. It was published a year ago without promotion by any educational organization. Practically every organization dealing with secondary education has scheduled a meeting to discuss its findings. The Educational Policies Commission of the National Education Association was responsible for *Education for All American Youth.* The National Association of Secondary School Principals issued an 80-page pamphlet, *Planning for American Youth,* a summary of *Education for All American Youth,* which has received wide reading and discussion.

Whatever the reader's personal opinion of the two books, he will undoubtedly agree that his thinking has been challenged by the repercussions they have created in educational literature. Thus, Franklin Bobbit (*School Review,* June, 1946) affirms: "The committee (Harvard) ought to extricate its small book and enlarge it into a well rounded and well wrought document. . . . If they would round it out and put it into clear, convincing terms they could make of it the authoritative charter of the nation's much needed educational advance."

A contrasting viewpoint is expressed by Prof. Will French of Teachers College and Chairman of the Committee on Curriculum Planning and Development of the National Association of Secondary School Principals. French admits the general approval given to the Harvard Report by Colleges but he emphasizes that the high school may take issue with those parts dealing with secondary education upon two scores. First, the question of whether there is now the nearly complete absence of a common program of education at the high school level which is reported, and second, the question of whether the committee's plan of general education for the high schools is an effective one for use with student bodies of present-day high schools which increasingly represent the entire range of learning ability.

YOUTH CONFERENCE

A two-day Youth Conference was sponsored by Teachers College. The conference was an outgrowth of President Conant's (Harvard) appeal for "A Truce among Educators" and was held at Teacher's College, Columbia University in November 1946. Many of the educators present expressed the belief that the most far-reaching proposal included in the committee reports was the suggestion that a "search for talent" be instigated under some national organization, such as the American Council on Education. Through testing, it would discover talents among youth earlier and the education of these superior students would be subsidized in cases of financial need.

In the Conference the reports of five committees were reviewed and altered by a group of about 200 educational scholars representing Liberal Arts Colleges, Teachers Colleges. Professional Organizations from all sections of the country. Committee report titles are: 1. The Responsibility for Educating All Youth. 2. The Character of General and Special Education in the Secondary School. 3. The Special Education in College of Potential High School Teachers. 4. The Discovery and Development of Talent in Youth (referred to above). 5. Pupil-Personnel Records Essential to the Education and Post-High School Placement of All Youth.

POLL OF EXPERTS

The *American Magazine's* Poll of Experts (February 1946 issue) reported that the schools' most unsatisfactory job is in training young people for personal and family responsibilities. The experts agreed that there should be less emphasis in the schools upon (1) drill and memorization; (2) requirement of foreign and ancient languages; (3) cold formality, as found in mathematics and English grammar, marks and preparation for college; and (4) high school athletic interschool competition.

More emphasis, according to the experts, should be placed upon education for citizenship, improvement of health education and physical fitness programs, preparation for marriage, vocational guidance and training and work experience, instruction in science for our atomic age, and finally, making school work more alive and interesting.

NATIONAL COUNCIL MEETING OF SCHOOL OFFICERS

The state school officers at their national council meeting in Buffalo in February, passed the following resolution: "That we recognize the critical shortage of post-secondary, academic, and technical educational facilities for veterans and civilians, and that we urge action upon the state departments of education throughout the nation to remedy these conditions, in so far as possible by augmenting existing educational resources with the addition of the 13th and 14th grades, capable of providing needed academic and technical education."

The development of technical institutes in New York State, the associated colleges which are sponsored by Cornell and other universities in New York State, the adoption of the K-6-4-4 plan in Stockton, Calif. are illustrative of the developments which are taking place throughout the country to supply the need indicated in the resolution passed by the chief state school officers.

MILITARY TRAINING

No bill for universal military training in peacetime was passed during the 79th Congress. Plans, however, were made by the War Department to bring before the 80th Congress a bill for universal military training. In February 1946, a statement was made by executive and legislative committees of the National Association of Secondary School Principals to indicate the position of the secondary school principals of the United States on the question of compulsory military training. The Secondary School Principals Association is opposed to the adoption of compulsory military training during peacetime. It does not believe that the program of universal compulsory military training during peacetime as proposed by our military leaders will give us the kind of national defense and security that all Americans desire.

The Secondary School Principals Association is ready to support a program that will give this country adequate defense and necessary security for the maintenance of its social, economic, and spiritual well-being. The Association emphasizes the importance of using all instrumentalities available for the elimination of war as a way to resolve international conflict. The Principals Association believes that the nation should be devoted to the establishment of a will for peace through the abolition of conscription and reduction of costly armaments. It believes that national defense and security can be adequately provided through the establishment of a professional Army, Navy and Air Force, by voluntary enlistments and the enlargement of our program of reserve officers' training in secondary schools and colleges on a voluntary basis.

Educators emphasize the importance of establishing an adequate and effective program of education for all youth in our schools. This program should especially include health education. During the Second World War, about 5,000,000 men were rejected on the basis of physical disability. In a statement before the Military Affairs Committee of the House of Representatives Nov. 28, 1945, Donald Dushane, Secretary of the NEA Commission for the Defense of Democracy through Education, pointed out some of the improvements that could be attained for American education with the same amount of money necessary for compulsory training. With $3,000,000,000 per year the following could be done: (1) construct a ten-room modern school building in every county in the United States each year; (2) construct a $50,000 library in every county in the United States each year; (3) construct annually a $150,000 hospital in each county; (4) employ ten full-time school and public health doctors and ten full-time school and public health nurses in every county; (5) purchase ten new modern school buses in each county each year; (6) maintain one psychiatric and behavior clinic in every county; (7) provide ten recreation and juvenile guidance workers in every county; (8) bring all schools of the country up to a reasonable standard of efficiency; (9) provide free education for the 3,000,000 children under 18 who are now not attending school; (10) meet the payroll of one junior college with ten instructors in every county; (11) provide all the expenses of a three-year post-graduate course for 10,000 selected students each year; (12) pay the full maintenance and tuition at college or technical school for one year of the 900,000 boys who would be conscripted under the May bill; (13) erect a $750,000 trade and technical school in each congressional district each year. This would leave an unexpended balance of $15,300,000 annually. If in the second and subsequent years, additional buses, hospitals, and libraries were not needed in each county, and a second technical school were not needed in each congressional district, the cost would be reduced to less than $2,000,000,000 a year.

LAY PARTICIPATION

The value of laymen's contributions to American education was given official recognition in March of 1946 when Commissioner Studebaker called together the newly established Citizens' Federal Committee on Education, in Washington, D. C., for the purpose of "advising the Commissioner of Education on policies and programs of service to education to be carried on by the United States Office of Education." It is planned that the committee's membership be representative of labor, business, agriculture, manufacturing, home-makers, professions, veterans' groups, religious groups, and Negro groups.

Among the critical reviews regarding education was an article by Harlan Logan, Editor of *Look Magazine,* who attributed the failure of American Education to confused objectives, out-dated evaluation, underpaid and misdirected teachers, inadequate equipment, and inefficient techniques.

Mark Starr, educational director of the International Ladies' Garment Workers Union in *Labor Looks at Education* (the 1946 Inglis Lecture on Secondary Education) maintained: "The basic trouble of our uncertainty about education at the present moment is that we are not sure what sort of citizens we want to produce. We are torn between education and money grubbing. Do we want to prepare students for civic responsibility—the wise use of leisure—or is it enough to train them for making a livelihood? Do we estimate the value of a man by the richness of his thought, the breadth of his reading, and his store of interesting experiences brilliantly described, or do we admire the 'big shot' whose skills are strictly commercial and whose claim to fame is based upon the size of his bankroll? . . . If we are not honest with ourselves, we can not be honest with our students. . . ."

Henry A. Wallace, Secretary of Commerce, described "The Challenge of Education" (January *NEA Journal*) as education for character—"the kind of character which enables us to get along in a decent, humane cooperative way." Wallace believes that education is the "most important single activity of civilized man." He maintains that some practical method must be found to "teach the values of decency and kindness—to bring the social ideas of the Sermon on the Mount into our daily educational routine." He proposes that we educate children "not only to make a success in life as competitive individuals, but also, and even more important, to work together in the service of the general welfare."

The critical situation in teachers' salaries caused many lay groups to participate on behalf of education. Never before have the press and radio and lay groups taken such an active part. Widely read magazines carried feature articles. Radio presented programs pointed toward informing the public on the greater need for support of education. Parent Teacher associations and other community organizations throughout the country participated.

FEDERAL AID

During 1946 substantial progress was made in respect to obtaining Federal aid for education. President Truman, in his annual message to Congress Jan. 21, 1946, made a strong appeal to that end.

The bi-partisan sponsored version of S181 introduced in the Senate March 27, 1946 included: (1) Provisions for setting up a minimum foundation or floor program for American public education, and (2) an ingeniously devised formula to encourage greater state and local effort to finance public elementary and high schools. The bill provided $225,000,000 a year for making possible a minimum education program costing at least $40 a child for every boy and girl in the United States.

The possibility for favorable consideration of Federal aid by the 80th Congress is indicated by the comments of Senator Hill of Alabama, one of the sponsors of the education bill. "When the new Congress convenes, it seems to me its first day should be distinguished by enactment of legislation as embodied in Senate Bill 181. There is no reason for delay with further hearings. We have the facts. We know the need. We must have action."

U. S. OFFICE OF EDUCATION

Early in 1946, Commissioner Studebaker began regrouping the United

States Office of Education into eight divisions in accordance with his previously announced "Plan of Organization to Improve the Services of the United States Office of Education." The divisions are: School Administration, Auxiliary Services, Central Services, International Educational Relations, Elementary Education, Secondary Education, Vocational Education and Higher Education.

Dr. Galen Jones was designated as director of the division of secondary education. Early in 1946, two specialists were appointed for secondary education, Dr. Howard Anderson, in the field of social studies, and Dr. Phillip Johnson in the field of science. Both men are recognized leaders in their respective fields. Later in the year Roosevelt Basler, an Illinois educator, was appointed chief of instructional problems. It is proposed to complete the organization for secondary education in the Office of Education by the eventual employment of a specialist in each of the subject fields together with adequate research assistants.

CURRICULUM TRENDS

In his opening address on "The Emerging Social Setting for Education," at the Association for Supervision and Curriculum Development's first post-war conference held in St. Louis early in 1946, Dr. Goodwin Watson suggested directions which the school must take during the next several years. He proposed that the speed with which the world has moved ahead in recent years almost makes our present conception of curriculum outmoded, and that in the light of these rapid changes, the schools today need to teach more about the way in which government functions, to be more concerned with the development of moral values than material production and to realize that the survival of our own civilization depends in a large degree upon the value we place upon human beings.

Many developments have taken place during 1946 which give promise of meeting the needs of high school girls and boys. A resolution having to do with the life adjustment training of a majority of secondary school pupils was adopted at a meeting of the Consulting Committee on Vocational Education in the Years Ahead which was held in Washington, D. C. in 1945. The resolution, which was presented by Dr. Charles A. Prosser, requested the U. S. Commissioner of Education and the Assistant Commissioner for Vocational Education to call a conference to consider the problem of student training and preparation.

Under the leadership of the Office of Education a two-day conference composed of representatives from both the Office of Education and outstanding persons in the field of secondary education was held in New York City. In this conference several pertinent problems were recognized: the identification of the youth with which Dr. Prosser's resolution was concerned, their characteristics, their total number, their early discovery, the means to be used in determining them, the educational needs of these youth, and the kinds of educational programs that will be adequate and proper for them, the provisions that school will need to make in order to furnish youth feasible and desirable programs. The Office of Education planned four regional conferences which were held during 1946 in Chicago, Denver, San Francisco, and Chattanooga. After the work of these conferences has been reviewed, the agenda will be developed for a national conference to be held at the Office of Education.

BASIC ISSUES IN SECONDARY EDUCATION

A further indication of the type of problems with which secondary school educators are concerned at the present time is shown by a recent committee report entitled "Basic Issues in Secondary Education." This report is the work of a consultative committee appointed by George D. Stoddard, Commissioner of Education of the State of New York, to consider postwar problems in secondary education in that state. Some of the questions which were explored in the preparation of the report follow: (1) How many constants should there be in the secondary school program? (2) What is the relation of the system of Regents examinations to the holding power of high school? (3) What is the relation between vocational and general education at the highschool level? (4) What is the place of work experience in the school curriculum? (5) As a result of the war experience, what changes should we undertake with respect to such matters as health and physical education, mathematics and technical subjects, foreign languages, humanities, art, and the social studies? (6) What changes are desirable in the school calendar with special reference to the utilization of the summer period? If the school year is extended, what modification should be made in curricular offerings? For example, do experiences in camping education or Boy Scout programs offer promising leads for regular secondary schools? (7) What is the relation of non-school experience to programs and outcomes in school; for example, in such matters as health, civic participation, character, and recreation? (8) Should there be a compulsory school-leaving age of 18 or of high school graduation (with exceptions based on case histories)? (9) What changes in buildings, fixtures, equipment, and materials are necessary if new programs are to be properly provided?

STUDENT ATTENTION TO SOCIAL PROBLEMS

In many communities students are becoming active in trying to understand and to help solve some of the social problems of the world. For example, at Oak Ridge, Tenn., the secondary school students formed a youth council on the atomic crisis. They have established a pattern that many schools over the country are following. In addition to studying the problems of control of the atom bomb in their classes, the students arranged for evening sessions with their parents and other community leaders. The special issue of their school paper went to 8,000 other schools throughout the country. In August 1946 their own representatives traveled to ten states. They participated in ten radio broadcasts. They wrote more than 1,000 letters to government personnel, to acquaintances, and to students in other localities.

Recognizing that improved human relations at home are necessary for an understanding and an ability to get along with peoples of other nations, schools are giving an increased emphasis to developing effective human relations. Two inter-group educational projects of a national character, involving about 20 large school systems, are being carried on. The American Council on Education is sponsoring a study of Intergroup Education in Cooperating Schools. The Bureau for Intercultural Education is working closely with several school systems, including Detroit, Philadelphia, and Gary, Indiana; helps to staff summer workshops, and has an important publication program. *Intercultural Education News,* published quarterly by the Bureau, is useful for persons who want to keep abreast of current developments. The yearbook of the National Council for the Social Studies *Democratic Human Relations,* by Hilda Taba and William Van Till, is the first book in intercultural education which brings together concrete illustrations of current practices in schools. That secondary schools are facing very realistic problems in the area of inter-group relations is indicated by the strike which occurred at Gary, Ind. in which white students desired to exclude Negro students from one of the high schools. Programs of intercultural education developing throughout the country give great promise that schools can become laboratories in which boys and girls learn to live effectively with one another, regardless of race, creed, or nationality.

SCHOOL HEALTH

On the basis of the findings from Selective Service, physical and mental defects discovered through many secondary schools are given much emphasis in efforts to improve health programs. A national committee on school health policies was formed in 1945, with representatives from each of the major health organizations throughout the country. The committee is now issuing suggested school health policies to guide schools who are concerned in improving their programs. It suggests that parents have the primary responsibility for the health of their children. Every school should establish its own school health council or health committee. Every school system, under whatever jurisdiction it operates, should have a central health council or committee with appropriate representation from all schools and for all groups interested in school health. Schools should work with community health councils wherever they are established, and if necessary they should take leadership in their organization and direction. Specific suggestions are made for school safety and sanitation, provision of a nutritious lunch, and the need for sound mental and emotional health of teachers.

MOTOR DRIVING TRAINING

The Traffic and Safety Department of the American Automobile Association made a comprehensive study to evaluate driver training for high school youth through analyzing the driving records of 3,252 Cleveland, O. high school students. The accident and conviction records of 1,880 high school students who received driver training instruction and 1,372 high school students who received no training were analyzed and compared. The conclusion concerning the reduction of accidents is embodied in the title of the publication.

CONFERENCES ON CONSUMER EDUCATION

During 1946, five conferences have been held throughout the United States on consumer education, at Cincinnati, Columbia, S. C., Philadelphia, San Francisco, and Los Angeles. At these conferences educators and laymen were given an opportunity to become acquainted with a series of teaching learning units for secondary school students which have been prepared by the Consumer Education Study of the National Association of Secondary School Principals. It has been carried on through a grant from the National Better Business Bureau and in cooperation with the national associations of teachers in the five subject fields of business education, home economics, mathematics, science, and social studies. From these conferences it seems to be evident that the American people are tremendously concerned with what is taught and how it is taught in our secondary schools. The conferences have demonstrated the wisdom of educators frequently bringing community leaders into the planning and constructive development of the school program.

COURSES IN FAMILY LIVING

Secondary schools are evidencing an increased concern for giving boys and girls courses in the secondary school which will prepare them for effective family living. In the Highland Park High School (Michigan) all senior boys and girls are required to take a semester's work in preparation for marriage and family life. In this course it is assumed that the best preparation for marriage is the building of a worthwhile, mature, mentally healthy person, who has a good understanding of himself and his place in the world. One of the units in the course has to do with the child in the home, his emotional development, the difficulties involved in growing up, and his position in the family. The adolescent and his rights, privileges, and responsibilities in the home and to society are studied. Problems of dating, manners, necking, and petting are discussed. In another unit, courtship, the engagement period, and marriage are studied. Parenthood and its responsibilities are given attention. Divorce consideration and its effect on the individual and the children are considered, with some time being spent on studying the trends of modern society that are increasing the divorce rate. Mental health is considered in another unit. The last unit of the course is directed toward the development of social consciousness through the study of many human problems—housing, recreational centers, poverty and its causes and results, immigration, crime, and the problems of the Negro.

WORK EXPERIENCE

During the depression years of the 30's, the National Youth Administration and the Civilian Conservation Corps were formed in an attempt to give to boys and girls needed employment. During this time more and more educators became acquainted with the values which might accrue from work experience. Many educators saw valuable educational experiences in the work programs of NYA and CCC and became convinced that secondary education should accept as one of its functions the provision of work experience for boys and girls. The Second World War made it possible for adolescents to secure employment without much help or direction from the schools. Since the war, however, many school men have attempted to develop, in their schools, work programs which will continue during peacetime years. A recent publication, *Work Experience in Secondary Education,* written by Harold J. Dillon and published by the National Child Labor Committee, has provided educators with an organized presentation on work experience. This publication summarizes the benefits which have been observed by those who are supervising highly successful programs of regularized study and employment which are being carried on by high schools and colleges throughout the country.

VOCATIONAL TRENDS

As secondary schools have attempted to meet the present-day needs of adolescents, the organization by which to provide the most effective teaching has often been discussed. The issue of the comprehensive *versus* the specialized high school has been the subject of many conferences. It now seems rather clear to most educators that vocational education should be for everyone. The critical question is to decide the appropriate years for each individual. For many this will come at the end or near the end of the high school. For others vocational preparation can be postponed until college years. The Research Division of the NEA, released in July of 1946, a résumé of the trends in respect to vocational education. Several trends seem to stand out. The comprehensive high school is favored by educational leaders if it can be administered with fairness to both general and vocational education. Vocational education is for all students, not solely for those who are preparing to enter the professional and technical fields. Vocational guidance should be part of all vocational education. An effective vocational education program needs close association with an advisory committee made up of employers, business and industrial leaders, and public-spirited men and women. More vocational education for adults will be needed in the future than has been given in the past.

THE CORE PROGRAM

It is significant that both the Educational Policies Commission and the National Association of Secondary School Principals have recommended a Core program. Gordon N. MacKenzie (May issue of *The Bulletin of Secondary School Principals* on "Education for Improved Community Life"), briefly describes the Core as having the following characteristics:

> A. It is carefully organized around problems of personal and community living. There is no attempt to follow subject lines such as English or social studies. Instead almost every subject known may at some time or another be drawn upon as pupils work on their problems. Proper handling of problems of personal and community living requires a direct focusing on these matters with the utilization of all possible resources. There is no attempt to fuse or relate the materials from two or more fields. The

organizing center is the problem under consideration and use is made of whatever materials or experiences may be needed.

B. It is allocated ample time, possibly three hours per day in the junior high school and two hours per day in the senior high school. This longer period facilitates the provision of suitable learning conditions, it offers a more flexible working situation, and it makes possible the use of a greater variety of learning experiences. For example, the longer period makes it easier to have much pupil cooperation in planning, a greater use of group activities and projects, and more work in and service to the community as a part of the instructional program.

C. It is the heart of the guidance program and serves as a coordinating center. The Core course replaces the home-room or advisory periods and the Core course teacher takes major responsibility for the guidance of his group. Because of the longer period, teachers have increased opportunity to know their pupils. Also the number of different pupil contacts for a teacher is greatly reduced. The Core course makes it possible to bring guidance and instruction into their proper relationship. The teacher becomes a counselor and carries responsibility for both individual and group guidance. There is great advantage in having as a counselor a staff member who has frequent and continued contact with an individual and thus can aid him in undertaking needed, desired, and significant learning experiences.

D. It is planned cooperatively by staff members, parents, and other lay citizens. Although one teacher is responsible for a particular Core course class group, he should have the assistance of subject specialists as well as those responsible for the various special services enumerated above, such as guidance, health, or remedial programs.

E. Its requirements are stated in terms of outcomes desired rather than ground to be covered. While directions are clearly outlined, and many resources and aids may be provided the teacher, there are no set books to be read.

IMPLICATIONS OF MILITARY EDUCATIONAL PROGRAMS

At the close of the Second World War, the American Council on Education appointed a Commission on Implications of Armed Services Educational Programs, with Alonzo G. Grace, Director, and M. M. Chambers, Assistant Director. Two publications have already been released. They are "Opinions on Gains for American Education from Wartime Armed Services Training" and "Utilizing Human Talent." "Educational Lessons from Wartime Training: The General Report of the Commission," will be released in March 1947. Other significant reports will be published during 1947 and include "Curriculum Implications of Armed Services Educational Programs," and "Audio Visual Aids in the Armed Services."

The conclusions emerging from the work of the Commission should have profound effect upon secondary education. The following statements are illustrative of the generalizations which are being made from the war experiences: (1) clear and specific objectives are essential for effective learning; (2) integrated programs are effective because they are necessarily predicated upon clearly defined objectives; (3) the only valid curriculum is the constantly changing one based on a recognition of needs; (4) change involves additions to, modifications of, and eliminations from the curriculum; (5) realistic learning activities are necessary if attitudes and skills are to function in life activities. "Learning by doing" is essential.

VETERAN GUIDANCE

The guidance of veterans was a major consideration in 1946. The Veterans Administration had by the end of the year established Guidance Centers in major areas of population. The demand for education under the G. I. Bill of Rights, caught the Veterans Administration unprepared. In 1945, payment to institutions and veterans for education lagged four to six months. In the fall of 1946 veterans who began their education in September could be reasonably certain of payment by Dec. 15.

Wide use of courses offered by the United States Armed Forces Institute and the General Educational Development Tests (High School Level) made it possible for most veterans to accelerate high school graduation. By the end of the year, 44 state departments of education recognized the General Educational Development Tests as a basis for granting a high school diploma or equivalent certificate. In using the tests, most state departments of education authorized high schools to accept the recommendation of the American Council on Education to grant a high school diploma to veterans who made a standard score of 35 on each of the five tests or an average standard score of 45. New Jersey, New York, Maine, and Massachusetts did not recognize the tests for diploma granting purposes but did recognize them as a guidance instrument for placement in a high school program.

All states made special provisions to help veterans in completing high school. In states where the General Educational Development Tests were not recognized for diploma granting purposes, elaborate systems of Veterans Evening High Schools and special classes were established. The programs in New York and New Jersey are illustrations.

Many colleges recognized the G.E.D. Tests as a valid basis for admission even though the veteran did not possess a high school diploma. Maryland used the test with civilian students as well as veterans. Studies in Chicago, Ohio, Maryland, and Missouri indicated that students admitted on the basis of the tests made as good records as students who were admitted on the conventional basis. In November, the President of the American Association of Collegiate Registrars advocated wider use of the tests for college admission. The evidence gathered on the use of the tests in 1946 indicates wider use of such methods of evaluating student growth not only with veterans but with civilians as well.

Closely allied to the acceleration of veterans are the studies on acceleration of other high school youth. Reports by Pressey at the Ohio State University show that, in general, school youth who were urged to finish high school in three years could do so without suffering ill effects, if wise guidance were provided.

The term "Guidance Program" of the school has become a fairly well established and meaningful term in educational literature. The term generally refers to those functions of a school which deal with students on a distinctly individual basis.

In Oak Park, Illinois, a group counseling program is being carried on at the eleventh grade level. The students meet with a counselor in groups of 15. They discuss the results of the Kuder Preference Record, American Council Psychological Examination, Iowa Placement Examinations (Mathematical Aptitude Test), Otis Self-Administering Test of Mental Ability, and Iowa Silent Reading Test. In the group conference, each student is given a profile of his test results. After discussion of the test results, students study opportunities in fields of their occupational interests and abilities.

In the Opportunity School at Denver, Col., a counseling analysis sheet has been worked out for each year of the Junior High School. The analysis sheet is made up of questions which guide the counselors in working with the pupils.

In Fargo, N. D. a study was made which compared the home-room plan of organization for guidance purposes and the plan of assigning students to a faculty counselor for guidance. In some respects, the home-room plan was found to be superior to the faculty counselor system.

TEACHING AIDS

The trend toward greater use of audio-visual materials was evident. Evidence furnished by the Military

Services (this has long been maintained by educational leaders) showed that well developed and dynamic visual and auditory aids make a learning experience from 10 per cent to 30 per cent more meaningful.

The Military Surplus materials in this area became available to educational institutions. However, much of the surplus was absorbed by veterans' high schools and by critical shortages created by the "overnight expansion" of the colleges.

Teachers are making greater use of teaching aids made available by Federal departments and agencies. In order to help teachers obtain instructional aids from authentic non-commercial, professional and government sources, a fifth revision has been made in the Office of Education's directory of agencies which furnish materials at a low cost.

Much attention has been focused upon Virginia's audio-visual education program as a result of the $1,112,530 for the purchase at $2 per enrolled pupil of maps, globes, charts, projectors, slides, films, and other audio-visual teaching aids. Additional appropriation was made for production of motion picture films of historical and natural resources of Virginia. The lack of electricity in 2,106 of Virginia's schools was a stumbling block to the widespread use of audio-visual materials. This problem was foreseen and the attack was begun under Governor Darden's Administration, and is rapidly gaining ground.

A comprehensive nationwide survey of the status of audio-visual instruction in city schools is being conducted. A study is being made by the National Education Association Research Division and is nearing completion.

With the promise of definite improvement in the audio equipment of schools in America, radio's proper place in the school is being re-examined. There is a trend toward the recognition that radio is not designed to supplant the teacher nor to serve as a medium for dissemination of information. It is now becoming more accepted as an ideal motivating force and as a medium for the development of attitudes. Many local radio stations are now working closely with school systems in order to provide programs of local interest.

HOME STUDY COURSES

Home study courses or correspondence courses have received status through their use during the war. Legislative action in California to approve credit in high schools for correspondence courses is typical of the trend. A major need will be filled in schools where the demand for a particular course is insufficient to warrant the employment of a teacher.

INTERNATIONAL AND INTERCULTURAL EDUCATION

In London in November 1945 educators and scientists met on behalf of international planning. All of the great nations, except Russia, were represented. The meeting translated into action a statement in the United Nations charter. That statement recommended the promotion of international educational and intercultural cooperation. Russia's failure to send a representative was viewed as related "primarily to the more general political and international situation," than to their disfavor of such a development. The Chinese delegation to the United Nations Conference in San Francisco is credited with initial proposals of international cooperation in education, science, and culture.

According to George D. Stoddard, an American delegate to the London meeting, the committee was able to complete its work in a few weeks because a great deal of groundwork had been done by Allied Ministers in Education meeting intermittently in London for a period of about a year and a half. "The London conference resulted in the creation of UNESCO (United Nations Educational Scientific and Cultural Organization). UNESCO is a specialized agency under the Economic and Social Council of the United Nations. Its permanent seat will be located in Paris. A general conference will be composed of not more than five delegates from each member nation. An executive board of eighteen members will be elected by the General Conference. The Executive Board is expected to show geographical distribution and will be competent in education and in the arts, humanities and sciences. . . . In addition to the Executive Board, a Secretariat will be established with a Director General and Staff."

The organization will bring together three major groups: (1) educators, including teachers, scholars, professors, and persons engaged in other informal aspects of education (educational services of radio, motion pictures, and the press); (2) scientists of the world in every field (there are already 400 societies and agencies having international membership); (3) cultural groups in which special emphasis is placed upon languages, literature, the Arts, and the various means of communication.

The entire constitution of UNESCO and a statement of some of the organization's purposes, appears in (March 1946) *The Bulletin of the National Association of Secondary School Principals.* The United States formally accepted membership on July 30, 1946.

The National Commission on Educational, Scientific and Cultural Cooperation is the link between United States citizens and the American delegation to UNESCO. It is made up of 64 representatives from national organizations representing many phases of American life and 40 representatives from the State Department.

Two international conferences of teachers were held during the year at Endicott, N. Y. and in Switzerland. At Endicott, a World Conference of the teaching profession was held Aug. 17-30. Resulting from the conference, a World Organization of the Profession will be established. Discussion at the conference centered on: (1) worldwide exchange of teachers and students between nations; (2) need for a universal language and more study of languages; (3) common world textbooks; and (4) elimination from the curriculum of extreme nationalism.

The International Conference on Public Education held its ninth session in March 1946. Thirty-six governments accepted the invitation of the Swiss government. The conference was organized by the International Bureau of Education. Two special questions received focal attention, namely equality of opportunity for secondary education and the teaching of hygiene or health education in primary and secondary schools.

HIGHER EDUCATION

By Ralph McDonald

National Education Association of the United States

GENERAL

The colleges and universities of the United States experienced the greatest and most rapid change in their history during 1946. To meet an unprecedented expansion in enrollment, the institutions strained every resource of plant, equipment, faculty, finance, and curriculum. The preeminent problem on practically every campus was to provide for a tremendous influx of students without sacrificing the fundamentals of quality in instruction.

War programs as such had practically all disappeared by the end of the calendar year, but several major war-connected operations continued on a contract basis as permanent features of college and university life. There was increasing evidence of a closer permanent relationship between the Federal Government and higher education, with military purposes preeminent.

By the year's end, the colleges had caught stride with the complex problems incident to post-war adjustments.

Although institutions generally were greatly overtaxed by the quantity of demand in relation to facilities and faculty, higher education had taken on a definite peacetime character, and post-war patterns were emerging.

PENALTIES OF SHORT-SIGHTEDNESS DURING WAR

The cultural retardation of the United States as a result of unwise policies of Selective Service and financial starvation of education had made too deep a mark to be erased readily. College plant and equipment had not only failed to expand normally since 1940, but had suffered further from deterioration and, in some cases, had been depreciated by military use.

Faculties had suffered even more heavily. With higher education being looked upon by the national leadership as merely another instrument of temporary military policy, teaching for the sake of promoting learning was pressured to its lowest ebb in generations. Professors, researchers, instructors, and educational administrators were drawn by the thousands from the institutions to enter military services, government war agencies, war industry, and other occupations.

Educational programs had been militarized on hundreds of campuses, the colleges for women and the small liberal arts colleges retaining their character as free educational institutions better than men's colleges, technological institutions, and universities.

Financial resources of institutions were depleted to the danger point. Public colleges and universities had in general received larger appropriations, but their financial strength had been adversely affected by the failure of other sources of money and by greatly increased costs. Private institutions had been weakened financially by the reduced flow of gifts, by the loss of a large proportion of the tuition income upon which they depended, and by the lower yield of endowment funds, as well as by increased costs.

Thus, the nation faced the post-war period and its heavy demands fully as unprepared for peace as it had been for war. The unpreparedness was clearly owing to the short-range viewpoint of the nation's war-time leadership. Fundamentally, the higher education structure of the United States was relatively weaker at the close of the Second World War than it had been at any time. The weakening had not come from within the colleges; it had been imposed from without. Effects of the enforced weakening of American higher education will be felt for many years.

STUDENT ENROLLMENT

Student enrollment reached an all-time high in the fall of 1946. A survey made by the United States Office of Education revealed a total enrollment of 2,078,095 students in 1,749 institutions in October, 1946 ("Higher Education Enrollment," Statistical Circular, U. S. Office of Education, Nov. 20, 1946, p. 1), as compared with a total enrollment of 952,000 in October, 1945. Enrollment climbed steadily in most institutions throughout the academic year 1945-1946, reaching an estimated 1,150,000 by June 1946. Summer enrollment held to a much higher point than in previous years, with students seeking to make up for time lost during war years.

Peak enrollment for pre-war years had been reached in 1939-1940, when the total was 1,494,203 as officially reported by the United States Office of Education (*Statistics of Higher Education*, 1939-40 and 1941-42, Volume II, Chapter IV, of the Biennial Survey of Education in the United States, p. 11). It is probable that the peak enrollment of full-time students rose to 2,300,000 or above by the end of November 1946, a figure almost 1,000,000 above the highest pre-war total.

There are indications that the total enrollment for spring terms may be slightly less than for fall terms, a normal expectation as indicated by pre-war experience. The upward trend of enrollment has not been broken, however. Registration for the fall of 1947 is expected to go well beyond 2,500,000 if facilities can be expanded to provide for that number. Further increase may be anticipated to a total of at least 3,000,000 to 3,500,000 within the next few years as the higher education structure is adapted, quantitatively and qualitatively, to the increased demand. An estimate of 6,000,000 total enrollment by 1950 has been made by one responsible student of education (C. E. Partch, Dean, School of Education, Rutgers University). Although other authorities consider that estimate too high, it is generally agreed that enrollment for the next several years will increase at a rate considerably beyond the most rapid possible rate of expansion of facilities and faculties. In other words, by 1946 indications, the greatest possible expansion of colleges on a sound and balanced basis for the next three years will still leave the nation falling short of meeting the demand for higher education on the part of the American people.

The increased numbers have altered the distribution of enrollment with respect to sex, educational level, age, kind of program, and type of institution. A very notable change in college population is found in the feature of marital status.

Men students have increased much more rapidly than women, 68 per cent of the students, reported in October 1946, being men, as compared with only 39 per cent in October 1945 ("Higher Education Enrollment," Statistical Circular, U. S. Office of Education, Nov. 20, 1946, p. 9). Veterans of the Second World War accounted for slightly more than half the total registration in 1946-1947, the number rising from approximately 100,000 in January to 425,000 in June, to 1,000,000 in October, and possibly to 1,200,000 by the end of November 1946.

Although classes were larger from the freshman year through the graduate school, greatest increases were at the freshman and sophomore level. Typically, 75 per cent of undergraduate enrollment was found in the lower division. The significance of this distribution was not lost upon university authorities. As the heavy enrollment moves upward to junior, senior, and graduate or professional level, the shortage of faculty and equipment will be much more acute. Freshman and sophomore enrollment is expected to remain high and increase further, but the more severe strain within the next three or four years will be at the upper levels, where the ratio of teachers to students is generally much higher and the amount and variety of equipment per student are considerably greater.

STUDENT DISTRIBUTION

College students in 1946-1947 were two to three years older on the average than pre-war students, because of the return of veterans and other students whose education was interrupted by the war.

Students in 1946-1947, particularly veterans, show decidedly different distribution among the various educational programs from the usual pre-war distribution of students. Engineering, commerce, pre-law and premedicine choices are much greater proportionately. Courses directly vocational in nature generally show heavier relative demand, but unusually restrictive admission to colleges of medicine and dentistry have held down the increase in these fields. The rush of veterans into engineering has been the cause of considerable concern lest an over-supply of engineers result. An authoritative estimate indicates that "the deficit of engineering graduates will have been wiped out by 1952. This means that the need for continuing engineering education at an overload level will lessen beginning with the entering freshman class in 1949" (*Journal of Engineering Education,* September, 1946).

One major field of professional education was in sharp contrast with the general trend. Teacher education programs enrolled more students than during the war years, but the proportion of all students enrolled for such courses was considerably below prewar levels. The enrollment in elementary teacher education was far below the minimum necessary even for normal replacements. Since a deficit of 350,000 teachers exists, in addition to normal replacement requirements, effects of the small relative enrollment for teacher education will be very serious in the life of the nation ("Leaders Letters" No. 59, National Education Association of the United States, Jan. 2, 1947). Teachers colleges reported a total enrollment in October, 1946, almost equal to the pre-war figure ("Higher Education Enrollment," p. 5), but a large percentage of enrollees in these institutions was known to be veterans and other students not planning to teach, who were in the teachers colleges because they could not secure admission elsewhere. The effect of such diverse enrollment threatens to dilute and weaken the quality of teacher education, thus compounding the injury caused by the quantitative decline in teacher supply.

State universities reported large increases in enrollment, with total registration in some cases more than twice the pre-war figure. As compared with 1945 enrollment, all types of institutions showed heavy increase, each classified group doubling its 1945 total enrollment except Negro institutions (*Ibid.*, p. 5). Enrollment at colleges for Negroes was so large in 1945 that facilities were taxed, thus restricting expansion by comparison with other institutions, most of which had less than capacity enrollment in 1945.

MARRIED STUDENTS

The most striking change in college population as compared with pre-war years was in the proportion of married students. It was not unusual in 1946 for 20 or even 30 per cent of the students in a university to be married. In many universities the proportion of married veterans reaches 40 per cent or more. Tens of thousands of these married students brought their families with them, producing a profound change in the social atmosphere of the campuses. The number of children of veterans reached into the hundreds at practically every large state university. University finances, facilities, and ingenuity were taxed to provide the necessary health, education, social, and family welfare services for the unprecedented camp following of families of students.

FACTORS IN FURTHER INCREASE IN ENROLLMENT

The factors pointing to further increase in higher education enrollment are unmistakable: (1) issuance by the Veterans Administration of certificates of entitlement to education to a total of 5,703,826 veterans up to Nov. 30, 1946, of whom it may be assumed that 2,000,000 or more will ultimately seek to enter college; (2) continuation of educational benefits to those inducted into the armed services for more than a year after V-J Day, most of these being young men serving relatively short terms in the Army or Navy, but entitled to educational benefits for a year longer than their respective terms of service; (3) the upward trend in high school graduation; (4) restoration of the pre-war climb in the proportion of high school graduates attending college; (5) gradual reduction in manpower demands of the nation's economic life, especially as youth are affected; (6) increased complexity of modern living, creating a greater demand for the products of higher education; (7) increasing recognition of the value of advanced education, both to the individual and to society.

VETERANS IN THE COLLEGES

In the preceding analysis of higher education enrollment, veterans were shown to constitute a majority of the college and university population. In the main, the veterans enrolled in college in 1946 were persons who would likely have attended college between 1940 and 1946 if the nation had not been at war. There were many (a minority, however) of the veterans in college who would not have been able to attend, as shown by a survey of veterans at George Washington University. Undoubtedly a large percentage of those who would normally have attended college would have found it impossible to do so at the close of the war without the liberal benefits extended by the Federal Government under Public Laws 16 and 346. Payment of tuition charges and student fees by the Veterans Administration, together with subsistence allotments of $65 per month for the veteran without dependents and $90 per month for the veteran with dependents, made it possible for most veterans to attend college if they wished to do so, provided they were qualified.

Heavy registration of veterans at publicly supported colleges and universities imposed much more serious financial burdens upon such institutions because of their relatively low tuition rates. In pre-war practice, the tuition charges of public colleges on the average represented only one-sixth of actual educational cost per student. Thus, the provision for payment by the Veterans Administration of only tuition and student fees meant that such institutions, on the average, needed five dollars additional revenue from some other source to match each dollar provided in Federal funds for the veteran's education. The burden was reduced by regulations permitting the institutions to receive Federal funds on the basis of non-resident fees, or on the basis of a minimum of $15 per month, $45 per quarter, or $60 per semester. Despite these adjustments, public institutions generally received far less Federal funds per student than private institutions to help with the cost of educating veterans.

Veterans merged imperceptibly into student bodies in a gratifying fashion. Reports from colleges throughout the country indicated that veterans in 1946 were equal or superior to other students in their academic achievement and in their adjustments to college life. The more than 1,000,000 veterans on the campuses in 1946-1947 showed little tendency to separate themselves, by veterans' organizations or otherwise, from the other students. The veterans' organizations which existed were almost all local campus groups not connected with the national organizations of veterans or with veterans' groups in other institutions.

STUDENTS WHO FAILED TO GAIN ADMISSION

It is estimated that a minimum of 100,000 students, who planned to attend higher education institutions in 1946, were unable to gain admission. The chief sufferers from the closed college gates were women students and those who graduated from high school in 1946. Hundreds of thousands of students were enrolled in institutions other than those of their choice. Extension centers and emergency colleges drew their registrants chiefly from among those who had failed to gain admission to regular institutions.

SHORTAGE OF FACILITIES

The pre-war establishment for higher education, depleted by the strain of the war years, was quite insufficient to provide for the increased enrollment. Adjustments were made along two lines: more intensive use of existing plant and equipment, and expansion of facilities.

Classes were enlarged in practically all institutions, and daily schedules were extended over more hours in the day, resulting in a considerable increase in the number of students per unit of classroom space. Night classes became commonplace. All available space was used as fully as possible in most institutions.

Facilities were far short of the need, even with maximum use and overcrowding. Wartime controls, shortage of building materials and manpower, and lack of funds made it impossible for colleges to expand their permanent plants materially. In some cases, buildings of various kinds were purchased and converted to college use. For example, Wayne University in Detroit purchased a hotel and several residences. While a few institutions erected dormitories and classroom buildings, and a few others started such construction in 1946, permanent plants on the whole were augmented very little.

With the aid of the Federal Government, temporary buildings were moved to hundreds of campuses, usually from military cantonments or defense centers. Through the Federal Public Housing Authority, temporary housing units for veterans were made available, the total falling somewhat short of a goal of 300,000 units set early in 1946. Use of such temporary units was restricted to veterans, with relaxation of regulations late in the year to permit the use of a limited number by faculty members teaching veterans. From the Army and Navy, there was transferred a substantial amount of housing and equipment to colleges and universities.

In August a law was ratified under which surplus buildings and equipment owned by the Federal Government might be transferred to institutions educating veterans (Mead Bill, Public Law 697). Under that measure the Federal Works Agency approved the transfer of surplus buildings and equipment valued at $56,628,017 to 800 institutions. The needs of the 800 institutions were only partially met, but 527 additional institutions, certified by the United States Office of Education as being entitled to such aid, had received nothing by the end of 1946.

EMERGENCY COLLEGES AND OTHER EXTENSIONS OF FACILITIES

Emergency colleges or temporary branches of existing institutions were established at abandoned military bases or defense centers. Three such emergency colleges were established in New York State, known as Champlain College (Plattsburg), Mohawk College (Utica), and Sampson College (near Geneva). Farragut College in Idaho was likewise established at a former military center. The University of Georgia took over two military bases to be sites for new units of the State University System.

Extension centers were established by the score, usually under the administration of state universities, with full credit being given for the college work offered at such centers.

Many new junior colleges were established, usually in connection with local public school systems.

The total number of colleges and universities included in the survey of college enrollment made by the United States Office of Education increased from 1,679 in 1945 to 1,749 in 1946.

Transfer of surplus government property under the powers granted to the War Assets Administration yielded only a small trickle of equipment to educational institutions.

The end of the year found the great majority of institutions with acute shortages of dormitories, classrooms, library space, laboratory facilities, administrative offices, and practically every kind of building and equipment needed in their educational programs.

STAFF PERSONNEL PROBLEMS

A serious shortage of instructional personnel continued throughout 1946 as one of the major problems of higher education. A large percentage of the faculty members who had entered the military services or other wartime employment did not return to the colleges. The small output of graduate schools during war years was insufficient to provide replacements. The great increase in enrollment made necessary thousands of additional teachers over and beyond the pre-war numbers. The shortage was estimated to be at least 10,000 full-time instructors (Report of Group V, National Conference on the Education of Veterans in Colleges and Universities, April, 1946).

The faculty shortage was further aggravated by low salary schedules throughout the nation. A study of 141 representative institutions revealed that faculty salaries for 1945-1946 were only 17.7 per cent above 1940-1941 levels, on the average (*Trends in Enrollment, Fees and Salaries,* University of Omaha, April, 1946). The increase in Federal taxes, together with increased prices, has reduced the buying power of the average faculty member's salary by 25 per cent or more below pre-war standards.

Adequate replacements and additions to staff on the basis of previous educational requirements were impossible. Thousands of instructors and assistants of very limited graduate training were employed to teach freshmen and sophomores.

The faculty shortage, both quantitative and qualitative, is expected to be much more serious in 1948-1949 when the present freshman and sophomore students have moved up to the junior and senior classes.

PRESIDENT'S COMMISSION ON HIGHER EDUCATION

In May, 1946, a report was made to President Truman by John W. Snyder, then Director of War Mobilization and Reconversion, on The Veteran and Education. On the basis of a study made by a committee of government agency experts, the report presented recommendations for government assistance to help bring about an expansion of facilities.

In July, President Truman announced the appointment of a special Commission on Higher Education, to study the role of higher education in American life and make recommendations. The Commission, composed of 30 men and women, chiefly college and university presidents, met several times in Washington and began its studies with the aid of a staff. A report is expected from the Commission by June, 1947.

COOPERATIVE STUDY AND PLANNING

Several conferences were held at the national level during 1946, in which representatives of higher education came together for voluntary cooperative attack upon their common problems. Particularly notable was the National Conference on the Education of Veterans in Colleges and Universities, held in Chicago in April 1946, at which plans were laid for a nationwide expansion of facilities to provide for the large veteran influx expected in the fall. Many of the actions taken by the Federal Government and by states and institutions grew out of the findings of the Chicago Conference.

Statewide planning was more widespread than ever before. Faced with unprecedented problems, college and university representatives came together increasingly in conferences and committees to plan their programs cooperatively on a statewide basis. In Michigan the numerous state institutions, though independent of each other, planned a joint presentation to the legislature.

RESEARCH

Research activities at the universities continued to lag in fields other than the few sciences in which military subsidies were available. Although data have not been compiled on the matter, it is likely that considerably more than half of the money spent on research at universities during 1946 was obtained through grants from the Army or Navy.

A bill to establish a National Research Foundation and provide subsidies for research under civilian control died in committee in both houses of Congress. Public hearings and committee study in the Senate laid the foundation for such legislation in the 80th Congress.

A measure was passed by Congress establishing a Commission for the domestic control of atomic energy (McMahon Bill, Public Law 585). One of the major features of the bill is a provision for the encouragement and subsidization of research on nuclear fission.

RESERVE OFFICER TRAINING

Both the Army and the Navy extended their permanent reserve officer training units in the colleges and universities. Army training units had been a regular feature in many institutions for many years, but the spread of Naval Reserve Officer Training Corps units was largely a development of the Second World War.

STUDENT COUNSELING

Greater emphasis has been placed upon student guidance and counseling than at any time in the history of American higher education. Despite a crucial shortage of trained personnel, colleges and universities extended considerably their services in this area. Guidance centers, established by contract with the Veterans Administration, augmented the regular facilities on many campuses.

CURRICULUM

Although 1946 brought forth no single study as widely publicized as the

Harvard report on *General Education in a Free Society,* published in 1945, the study of curriculum was widespread. Most of the curriculum planning took place in individual institutions as their courses were studied and revised in relation to post-war conditions and the needs of more mature students.

COLLEGE AND UNIVERSITY FINANCE

Payments made by the Veterans Administration under Public Laws 16 and 346 constituted a major source of revenue for current operations of institutions enrolling veterans. Such payments fell far short of the expense incurred by the colleges and universities in providing educational programs for veterans, however, particularly in the case of publicly supported institutions. The University of Illinois, for example, spent $17.09 per credit hour of training taken by veterans and received only $9.65 of that amount from the Veterans Administration (C. C. DeLong, Bursar).

Current revenue from other sources was insufficient to provide for the operating needs of most institutions. Emergency grants from state governments were helpful in Alabama, New York, and a few other states. In general, however, current operating funds were very inadequate.

One of the effects of inadequate current financial resources was that faculty salaries remained very low. Plans of representative institutions called for only 8.4 per cent average increase in salaries for 1946-1947, over 1945-1946 (*Trends in Enrollment, Fees and Salaries,* University of Omaha, April, 1946).

Many colleges raised tuition rates and student fees in an effort to reduce their financial strain. One survey showed that more than half (75 out of 141) of the institutions reporting had raised tuition rates for 1945-1946 over those of 1940-1941. More than one-third (50 out of 141) were raising their 1946-1947 rates above those for 1945-1946 (*Ibid.*). Increases were less frequent among state universities, teachers colleges and municipal universities; increases were much more frequent among private and endowed institutions. Increases in state institution rates were chiefly in the schedules for non-residents. The influence of Public Law 346, under which Federal payments for veterans' education were measured by tuition, was clearly the chief cause of increased tuition scales. The increase in non-resident fees of state institutions (ranging up to 600 per cent) was due largely to Public Law 346 and an interpretation which permitted payments for resident and non-resident veterans to be made on the basis of non-resident fees.

Even with the yield from increased tuition rates, however, most colleges and universities had less operating funds than they needed to maintain high standards of education and adequate salaries for their staffs. Money for permanent building was available to only ten per cent of the colleges, according to a survey of 458 institutions in May, 1946 (Department of Higher Education, National Education Association).

THE OUTLOOK

Despite their harrassing problems, their acute shortages of housing and equipment, their continuous strain of expansion, their faculty crisis, and their financial distress, the colleges and universities of the United States were foci of a determined but practical sort of optimism. The buoyant hope of two million young Americans looked beyond the strain and stress of post-war adjustment. Judged by the spirit of the campuses, America's look was a forward one in 1946.

EDUCATION FOR THE PROFESSIONS

By George D. Strayer, Jr.*
Associate Professor, School of Education, Indiana University

BUSINESS EDUCATION

Increased Federal Support. — One of the most important developments during 1946 was the signing of the George-Barden Act on Aug. 1. This act increased most of the appropriations formerly provided under the George-Deen Act. Appropriations for agricultural education were increased from $4,000,000 under the George-Deen Act to $10,000,000 under the George-Barden Act. Funds for industrial education and home economics education were doubled, making the latest appropriation $8,000,000 for each. The amount allocated for distributive education is $2,500,000. whereas it was formerly $1,200,000. The funds allocated for Federal administration remain the same; namely, $350,000.

The various states are still required to match by state and local funds 100 per cent of the appropriations made under the Federal Act. A number of new requirements were established concerning the uses which might be made of the Federal funds. The expenditures now authorized include such items as salaries and necessary travel expenses; maintenance of administration, supervision, and teacher training; vocational counselors and supervisors of vocational guidance training programs for apprentices; training and work experience; training programs for out-of-school youth; and research in the administration of vocational education and vocational guidance. One of the important changes is that persons over 18 years of age who have left full-time schools are now permitted to engage in courses in session less than 30 hours per week and less than nine months per year. These same individuals may also engage in shop work without fulfilling the former requirement that a minimum of 50 per cent of the time should be given to shop work on a useful or productive basis.

Publication of Research Studies.—Delta Pi Epsilon has conducted a competition since 1940 to encourage research in the field of Business Education, and each year it has published the winning study. Another development that tends both to encourage research and to make the results available for use is the publication once a year of a research issue of the *Review of Business Education,* which is a bulletin of the Oklahoma Agricultural and Mechanical College at Stillwater, Okla. Two issues have appeared—one in 1945 and one in 1946.

Organizations.—Since 1944 a joint handbook has been published by the Eastern Commercial Teachers Association and the National Business Teachers Association. This joint publication is one indication of the movement in Business Education for closer cooperation between existing organizations. Another move in this direction was the recent establishment of the United Business Education Association which is affiliated with the National Education Association. This new organization is a consolidation of the former National Council for Business Education and Business Education Department of the National Education Association. Both of these organizations have transferred their interests and programs to the United Business Education Association.

The Vocational Division of the U. S. Office of Education has published pamphlets and bulletins from time to time of value to those working in the Business Education field, and is now publishing bibliographies and bulletins under the Business Education Service Program.

---

* The writer is indebted to Dr. Gould Wickey, Executive Secretary of the American Association of Theological Schools, for a statement which is the basis for the section on Theological Education.

Veterans.—In many studies which have been made of career preferences of veterans, it has been found that one of the most popular choices has been business. Despite the fact that many of the veterans have enrolled in undergraduate liberal arts programs, many of them are still planning to enter the field of business. Schools of business administration in many senior colleges and universities reported that they had a larger percentage increase in enrollments during 1946 than other divisions of the college or university. The apprenticeship or on-the-job training program has been selected by some veterans who felt that they could learn more in that way, or who desired to speed up their acquisition of knowledge and skills. Insurance companies are an example of one business that has cooperated with the returning veterans in providing this type of training.

Opportunities.—Owing to the fact that the number of business and clerical employees of the Federal Government has not decreased markedly, and owing to the increased production in many industrial enterprises, there has been a steady demand for those with business education backgrounds, and no immediate slackening in the demand is apparent.

The expanded enrollments of many schools of business in colleges and universities and separate business schools is indicative of the fact that every effort is being made to supply trained workers. Some of the areas in which business education may function during 1947 are in pre-induction training for military service, business education in the Army, Navy or Marine Corps, and in the training of both enlisted and officer personnel in the Naval Reserve program.

Programs and Courses. — New courses have been organized at some higher educational institutions for the study of such problems as airport management, air transportation, or secretarial duties in aviation, medicine, law, and government. Additional courses have been established dealing with personnel administration, retailing, insurance, and real estate.

The short-course business programs may be illustrated by the following list of some of those offered by the School of Business of Indiana University during 1946: two weeks course for savings and loan officers, four weeks conference on fire and casualty insurance, two weeks lecture and discussion for insurance investment officers, and a seminar for executive secretaries of commercial and trade associations.

One of the most interesting cooperative undertakings was the continuance in California and the extension in Washington of the Business Planning Institute which brings together representatives of educational, business, civic, and service organizations for discussion and planning. This Institute was initiated and developed by the Bureau of Business Education of the California State Department of Education.

ENGINEERING EDUCATION

Enrollments.—The May 1946 issue of *The Journal of Engineering Education* reported that the enrollments for the school year 1945-1946 represented a 76 per cent increase over the enrollments in the school year 1944-1945 but that the totals were 36 per cent less than the peak enrollments which were achieved in the school year 1941-1942. There is every indication that the need for trained engineers will probably be greater than the supply during the next four or five years. The low enrollments of recent years and the increased vocational opportunities for persons with engineering training are possible reasons for this situation.

Humanistic-Social Studies. — Robert M. Boarts and John C. Hodges prepared a report which was published in *The Journal of Engineering Education* concerning the characteristics of humanistic-social studies as offered in connection with the program of engineering education. They studied the programs at the Carnegie Institute of Technology, Case School of Applied Science, Columbia University, Cooper Union, Massachusetts Institute of Technology, Michigan

State College, Polytechnic Institute of Brooklyn, and Purdue University. They found that there was only one instance in the institutions which they visited where the engineering faculty had determined the course offered by the humanistic-social staff. They further stated that the course which was developed under these conditions was not considered to be particularly desirable by either the engineers or the humanistic-social staff.

Some of the institutions which the authors visited agreed that social consciousness was a desirable objective for engineering education, and in these colleges the study of history as a social science was considered desirable. Various plans were found in the different institutions mentioned above with one of the more elaborate plans found at Carnegie Institute of Technology where a committee of liberal arts, science, and engineering personnel was in action to work out solutions to differences of opinion and to keep the courses offered in line with the objectives. Plans at Columbia University and Michigan State College include humanistic-social studies in the pre-engineering plan and one required course in the junior year. At Massachusetts Institute of Technology a course is offered entitled United States and World History. Purdue University stresses English composition, and the Polytechnic Institute of Brooklyn insists upon a very comprehensive program of English instruction. One of the most significant statements made by the authors was that "Technical education can best be liberalized by encouraging individual faculty members to achieve a broad and liberal viewpoint and to reflect that viewpoint in their teaching."

Measurement and Guidance Project.—K. W. Vaughn, the director of the project, reported during 1946 concerning the progress to date and the plans for the future. The freshman entrance examinations, which have been called a pre-engineering inventory, were revised for the third time in the summer of 1944, and so far they have been given to a total of 35,000 individuals. The sophomore achievement tests for engineering students are now in experimental form and will be administered on a nationwide basis for the first time in February or March, 1947. The pre-engineering inventory is used as a general estimate of the probability of the student succeeding in the engineering course, while the sophomore achievement tests have been prepared to evaluate the possible success of the individual in the further study of engineering.

Effective Teaching.—Engineers, in common with many other professional persons, have found that one of the basic problems in the improvement of education for the professions is that of improving teaching. Many requests for such assistance have been received by various engineering groups, and a committee of the engineering faculty of Virginia Polytechnic Institute prepared a bulletin entitled *Effective Teaching* which was issued as Engineering Extension Bulletin No. 42. This bulletin has had a wide distribution and has been mentioned by the American Society for Engineering Education as a desirable source of information concerning teaching techniques.

Some of the engineering educators who left their teaching positions during the recent war to engage in various types of war work have been encouraged by the higher salaries paid by industry and by research laboratories to continue their work for government or industry and to decide not to return to their teaching duties. This fact is mentioned in *The Journal of Engineering Education* as one of the problems which is faced by the engineering schools in attempting to carry on their programs with increased enrollments.

LEGAL EDUCATION

Law Schools.—The law school enrollments in the United States for the fall semester of 1946 increased greatly over the previous fall semester and exceeded even the enrollments in the fall of 1937.

Northeastern University School of Law at Boston, Massachusetts, was admitted to membership in 1945, and the law schools of Willamette University at Salem, Ore., University of Connecticut at Hartford, University of Miami at Coral Gables, Fla., St. Johns University at Brooklyn, N. Y., Detroit College of Law, and Wayne University Law School were admitted to membership in December, 1946.

One of the most important developments during the year which may have great influence upon the profession as well as upon legal education is the launching of a three-year study entitled American Bar Association Survey of the Legal Profession and Legal Education. One hundred thousand dollars has been appropriated by the Carnegie Corporation, and the study will be under the auspices of the American Bar Association which has agreed to spend $50,000 on the project.

Continuing Education. — The American Bar Association has assumed the responsibility for organizing both post-graduate legal education as offered through law schools and institutes and also other types of continuing education made possible by correspondence courses or refresher courses. Some of this work will be carried on by the Practising Law Institute which is located in New York City, but many of the continuing education programs will be offered in connection with law schools in various parts of the United States.

Teaching and Examination Methods.—The Committee on Teaching and Examination Methods in its latest report emphasizes the desirability of making more use of objective type questions and in its 1945 report gave examples of such questions in 15 printed pages. The Committee raised several fundamental questions in connection with existing teaching methods, such as the usefulness of text materials for law teaching to supplement the existing case books. The members also recommended that the 1947 meeting of the Association of Law Schools consider some of the problems related to teaching methods in a general session. The report further suggests that some of the materials which have been prepared for teaching purposes have actually been written primarily for other law teachers and lawyers rather than for students.

The Curriculum.—The Committee on Curriculum has considered various possibilities in studying the scope and sequence of pre-legal and law study. Consideration of the contributions which might be made by the social disciplines has stimulated practical suggestions, and proposals for 2-4, 2-2-2, and 3-4 plans have been made in the attempt to create a more desirable division of the liberal arts and law school programs. The University of Denver has adopted the 2-2-2 course of study and plans to follow the idea advanced by Prof. Jerome Hall of Indiana University of including both law and social science courses in the last two years of the six-year program following two years of law courses exclusively.

Some of the approved law schools are increasing the law curriculum from three years to four years whereas other law schools have taken a definite stand in favor of continuing a three-year curriculum. Other trends in the curricula of member schools are an increase in the number of courses offered, increased emphasis on public law, inclusion of the summer session as part of the regular school year, and reduction or elimination of electives. Additional light may be thrown on these problems by the survey of the profession by the Carnegie Corporation and the American Bar Association, and by a survey of law practice and law study which is being made by the Harvard Law School.

MEDICAL EDUCATION

Reconversion of the Accelerated Program.—The medical schools have made plans for annual admissions in the fall of each year, in the majority of cases. Tennessee plans to admit students quarterly, and Louisville, Minnesota, and Marquette state that they will continue to admit students more frequently than once a year. In addition to admitting classes annually, almost all of the schools are decelerating so that students will complete their work in four years rather than following the three-year war program.

The estimated number of graduates from June 1, 1946 to June 30, 1947 is 6,544. Owing to the gradual dropping of the accelerated program, some students will graduate every month from June, 1946 to June, 1947 with the exception of August, 1946.

From July 1, 1942 to June 30, 1945, there were 20,662 graduates, and 5,826 graduates were reported in the summer of 1946. The additional 6,544 mentioned above indicates that there will be a total of 33,032 graduates during the five-year period begun July 1, 1942. The preceding five pre-war years produced 25,818 graduates. The accelerated program was therefore successful in training 7,214 more physicians than would have been trained if the regular program had been followed.

Medical Schools.—All of the basic schools of medical science except Dartmouth are considering expanding to a full four-year program. Laws have already been passed in Mississippi, North Carolina, North Dakota, and South Dakota authorizing this expansion.

Several states have studied the possibility of establishing entirely new medical schools, and two schools are in the process of development. One is the new medical school at the University of Washington in Seattle, and the other the medical school being established in Los Angeles as part of the Los Angeles Division of the University of California. The Aug. 17, 1946 issue of the *Journal of the American Medical Association* lists statements dealing with the problem of the establishment of entirely new medical schools. These statements include consideration of the cost, which is said to be greater than for any other form of higher education, and the possibility of interested individuals entering medical school. It is pointed out that the distribution of physicians in the various states is more closely related to per capita income of the particular state than it is to the presence or absence of a medical school within the state.

Preliminary Education. — During the war many of the medical schools reduced their pre-medical requirements. The present trend is toward the reestablishment of the pre-war requirements, and 67 of the 87 schools now require three or more years of pre-medical work.

Medical Licensure. — During the year 1945 the medical examining boards of 48 states, District of Columbia, Alaska, Hawaii, Puerto Rico, and Virgin Islands issued 9,153 licenses to practice medicine and surgery. Of these licenses, 5,541 were issued upon the basis of the examination results and 3,612 were issued on the basis of reciprocity and endorsement of other state licenses or by certification of the National Board of Medical Examiners.

The greatest number of graduates examined from any one school was 228, all of whom had attended Indiana University School of Medicine. Of these, 213 were examined in Indiana, and 15 were examined in seven other states. It is interesting to note that only one of these 228 individuals failed in the examinations. Twenty-seven approved schools in the United States had no failures before medical licensing boards whereas nine schools had ten per cent or more failures in state examinations.

Some kind of reciprocal relationship in medical licensure has been established in 44 states, District of Columbia, and Puerto Rico. Florida, Idaho, Massachusetts, Rhode Island, and Hawaii have not agreed to any reciprocal arrangements as far as medical licensure is concerned. However, all of these areas except Florida will grant registration to those who have been approved by the National Board of Medical Examiners.

Internship.—There has been very little change in recent years in the number of schools and medical boards requiring internships for the M.D. degree and for licensure. According to the *Journal of the American Medical Association,* six schools in the United States and four in Canada now require an internship for graduation. Twenty-three state medical licensing boards have this as one of their requirements for licensure. It is also required by the boards in the District of Columbia, Alaska, Canal Zone, Hawaii, and Puerto Rico.

The most frequently used list of approved internships is the one compiled by the Council on Medical Education and Hospitals of the American Medical Association. In a few instances medical schools or licensing boards have established a special list of the hospitals which they consider acceptable for the training of interns.

New Developments in Medical Education. — The War Department has recently approved the loan of medical motion picture films produced by the Surgeon-General to medical groups, individual physicians, or medical schools. The films are available only to members of the medical profession and for non-profit showings.

NURSING EDUCATION

Education and Personnel. — On Jan. 1, 1946, the total enrollment in the state-accredited schools of nursing was 128,826. While this is not a low enrollment in comparison with some of the previous years it is still not sufficient to prepare the number of individuals needed to meet the increased demands for nursing services which have come about in recent years. It is believed that the increased demand for hospital nurses and the need in many communities for increased hospital facilities has been owing in part to the Blue Cross and similar plans of hospital insurance. Many persons paying these insurance premiums seek hospitalization whenever there is a real need, while individuals prior to participation in insurance sometimes postponed medical treatment or received it at home.

Shortages of hospital nurses is thought to be caused to a considerable extent by the high salaries paid by the Veterans Administration and other branches of the Federal service. Some of the nurses who served with the armed forces accepted positions with the Veterans Administration rather than return to hospital work or private practice.

Current Trends in Approved Schools of Nursing. — One of the most interesting developments in schools of nursing has been the increased emphasis placed upon health teaching and public health problems. This has come about through the introduction of new teaching units and also through the addition of topics in these fields by the reorganization of courses.

In many instances advanced professional programs are being established at universities with hospitals, public health agencies, and other necessary community agencies serving as experience or practice areas. During recent years, several experimental projects have been carried on through the cooperation of universities and community organizations. The Association of Collegiate Schools of Nursing and the National Organization for Public Health Nursing have aided in the development of university programs for the training of professional nurses through their committees on evaluation. The publication by the National League of Nursing Education of the volume entitled *Guidance Programs for Schools of Nursing in 1946* will be of real assistance to some of the nursing schools now in process of improving their programs in the field of guidance. The N. L. N. E. also published during 1946 a bulletin entitled "Faculty Positions in Schools of Nursing and How to Prepare for Them." This will undoubtedly serve the dual purpose of aiding the thinking and planning of those interested in qualifying for such positions and in time help the institutions themselves to select from a group of individuals with desirable training and experience for the nursing education field. This publication will also be valuable for use by faculties of nursing schools for self-improvement purposes and for institutions engaged in the education of future nursing school faculty members.

Report on the Structure of Or-

ganized Nursing.—The October, 1946 issue of the *American Journal of Nursing* included a very important statement concerning the study which is being made by Raymond Rich Associates for the Joint Study Committee of the six national nursing organizations. Although the study has not been completed and there is considerable difference of opinion concerning the recommendations to date regarding it, progress has been made in considering the objectives of the nursing profession and the best means of gaining united support for furthering the major purposes finally agreed upon. Many of the present problems of accreditation, social and economic welfare of nurses, and provision of an adequate and well qualified nursing service will be solved or more nearly solved as a national program is developed and adopted for insuring the cooperation of all of those engaged in nursing.

National League of Nursing Education.—The list of schools of nursing meeting minimum requirements as established by the various states was not available at the time this statement was prepared. However, the list which is published each year is exceedingly detailed and can be obtained from the N. L. N. E. for $4.50. The type of information which is included may be indicated by the fact that such matters as the control of each school, entrance requirements, tuition and other expenses, the number of professional graduate nurses serving as staff members, and the length of the program are all a part of the printed table. The schools are listed by states, and the hospital, university, or college with which each school is connected is named.

EDUCATION FOR PUBLIC ADMINISTRATION

Public Administration Clearing House. — The Public Administration Clearing House in Chicago has taken over the work of the Committee on Public Administration of the Social Science Research Council, and the list of colleges and universities offering programs of training is now published by this organization. The latest list was published in September 1946, and follows the same pattern used in previous years.

Curriculum Trends. — The trends in training may be illustrated to best advantage by a summary of some of the developments in certain universities. The training program at the University of Wisconsin is under the leadership of the Department of Political Science, and although few courses in public administration are offered, the administrative point of view is stressed in many courses. According to latest reports, about 100 students are majoring in public administration. A further development in Wisconsin has been the expansion of the Extension Division of the University with plans for offering political science courses in about 20 Extension Centers. This may serve to help local governmental personnel, as many of the instructors expect to provide services on a consultation basis.

The University of Minnesota has made two recent changes in its training program which has been in operation for ten years. The former thesis requirement for the master's degree in Public Administration is now optional, and a student may spend an additional quarter in course work instead. Internships have also been placed on an optional basis. No change has been made in the number of students, as the program is still limited to 18.

Two new courses have been announced at the University of Illinois. One is an undergraduate course in personnel administration and the other is a graduate course in international administration. The Political Science Department is not satisfied with the present plan of course offerings and is interested in developing some type of institutional organization to centralize interest in public administration training.

A new program leading to a master's degree in Public Service Engineering is being planned at the Illinois Institute of Technology. This Institute offers a bachelor of science degree in Public Service at the present time.

The Institute of Public Administration, which has been established at the University of Michigan limits enrollment each year to from 12 to 18 students having an interest in Public Administration. These individuals are encouraged to specialize in some field, such as engineering, economics, forestry, or public health. Internships are arranged in the Bureau of Public Administration of the University in city or other governmental units in the state or in the Michigan Municipal League.

About 50 per cent of the Political Science students at the University of Chicago, inclusive of those in Industrial Relations, are enrolled in the Public Administration program. Some of the students receive joint degrees from the School of Social Service Administration and the Industrial Relations Center. The new four-year college has made possible a three-year program for departmental master's degrees.

An internship is required for the master's degree at Ohio State University, and all Public Administration students must enroll in two basic courses concerned with the staff and functional aspects of administration. Field work is arranged in connection with the various governmental offices in the state capitol where the University is located. A new graduate course in Comparative Public Administration is being offered for the first time this year, and plans have been made for publication of a series of monographs. Both the Political Science Department and the Law School are interested in bringing about the organization of an Institute of Public Affairs.

TEACHER EDUCATION

Recruiting.—The most widely discussed problem in Teacher Education during 1946 was ways to recruit additional personnel for training and for service as teachers. The critical situation throughout the United States. which has necessitated employing thousands of teachers holding temporary certificates, has been caused by decreased enrollments in teacher training courses during recent years and individuals leaving the teaching profession to engage in more remunerative occupations.

Commission on Teacher Education.—The work of the Commission on Teacher Education, which has published its final report, is now being carried on by the Council on Cooperation in Teacher Education. The Commission, in a volume entitled *The Improvement of Teacher Education* suggested that there were five factors which should be given careful consideration in the light of the present shortage of qualified teachers. First, the average salary provided in 1944 was less than $1,800, and second, some states are apparently unable financially to raise teachers' salaries to a level which will compete with other occupations. The Commission also points to the need for occupational security which may be brought about by tenure legislation and the desirability of sick-leave and a reasonable pension system. It is further suggested that the right to live a normal life is desired to such an extent that some individuals refuse to consider teaching, and others may switch to other occupations, even though they have received the necessary certificate. Democratic administrative leadership is considered by the members of the Commission as of utmost importance if teachers are to make the best use of their preparation and experience. It is suggested that few teachers will do a good job in an atmosphere of suspicion, tyranny, or disdain. The profession may be made more attractive and teachers may feel better satisfied if an in-service program of Teacher Education is organized in such a way that teachers will actually learn how to become more proficient. The Commission points out many other important areas for consideration such as more student participation in the planning of their own educational experiences; more satisfactory pre-service education of teachers; more financial aid for first-rate students; and greater institutional unity in programs of higher education.

Despite the generally pessimistic outlook as reflected by articles in both lay and professional magazines, several encouraging developments have taken place in addition to the splendid recommendations of the Commission on Teacher Education. In November 1946, California voters passed an amendment to the constitution which provided, among other things, a minimum salary of $2,400 for all teachers. They also voted for a provision whereby public education is guaranteed priority in regard to all state revenues. The profession of teaching also made real gains in Michigan, Oklahoma, Oregon, and Utah on election day as measures were passed in those states increasing or improving the support for public schools.

Despite the fact that enrollments in many colleges and universities have doubled in comparison with enrollments of two years ago, there has not been a corresponding increase in the enrollments in teacher training institutions and in educational courses. The present demand for consumer goods of all kinds has undoubtedly influenced veterans and others in turning to business or industry as a career. In all probability, the first business recession will find many individuals formerly engaged in teaching, and some who have never engaged in the profession, seeking opportunities in the field. The immediate situation has been made even more difficult by the fact that elementary school enrollments are increasing in many communities, while the supply of trained teachers has diminished.

Understanding World Problems.—Many of the national meetings held during 1946 were concerned with methods of improving teacher training. In addition to the usual recommendations for changes in curriculum methods, materials, and points of view, there was also considerable discussion of inter-group relations and teaching an understanding of world problems. A college study conducted at Wayne University, Detroit carefully considered plans for solving problems of race, creed, national origins, and social class. The United Nations Educational, Scientific, and Cultural Organization has been widely publicized as the international agency through which individuals and organizations can work to develop mutual knowledge and understanding, and a sense of world unity. Although no single meeting has been devoted entirely to discussion of the problems which have arisen in connection with organized labor, problems in this area have been discussed and suggestions have been made concerning what teachers can do to increase understanding in this area and help in the ultimate solution of some of the basic issues.

American Association of Teachers Colleges.—The American Association of Teachers Colleges is conducting a comprehensive study of the student teaching practices in normal schools, teachers colleges, and selected arts colleges. When this study has been completed, it will serve as a valuable guide for use in improving this aspect of teacher education. The list of accredited institutions effective until March 1, 1947 was published in the *Twenty-fifth Yearbook* of the American Association of Teachers Colleges, and four institutions were added to the list which were not on the list during the previous year. The analysis made of the 1945 annual reports indicated that 37 institutions did not meet the minimum requirements of one or more of the standards of the Association. The Sloan Foundation Studies in Applied Economics are being carried on in certain teacher training institutions as well as in some public school situations. The efforts of the Foundation to improve economic conditions in certain areas through the selection of teaching materials, especially on the elementary school level, are being continued, and the Foundation is working with the Standards Committee of the American Association of Teachers Colleges in seeking to gain wide acceptance and utilization of certain basic economic ideas.

THEOLOGICAL EDUCATION

Enrollments.—Sixty-eight schools reported a total enrollment of 6,090 in September, 1946, an increase of 10.8 per cent over the enrollment of September, 1945. An increase of 21 per cent was reported for students studying for degrees beyond the B.D., while the increase in the percentage of students studying for the B.D. degree was only 6.4 per cent. Many of the graduate students served as chaplains in the armed forces and are now taking advanced work with tuition and subsistence paid by the Federal Government.

Accredited Schools.—The total number of accredited theological schools in 1946 was 69. The American Association of Theological Schools accredited seven institutions during the biennium 1944-1946. In order to assist the accredited schools in maintaining standards, the Association plans to make reviews of the accredited schools in programs of advanced degrees 1946 to 1948, libraries 1948 to 1950, faculties and students 1950 to 1952.

Standards in Theological Seminaries.—The present entrance requirements for seminaries include in most cases graduation from a four-year college or its equivalent, but a few of them admit students from the sophomore classes of liberal arts colleges on examination and state that the outstanding students chosen are qualified to do the work in the professional school. Some of the seminaries administer examinations to entering students in order to determine strengths and weaknesses of each student and make provision for special attention where the need is indicated. The American Association of Theological Schools has established two classes of accredited schools. Class A includes all institutions which fully meet the standards of the Association, and Class B is for those institutions which do not require "for admission to candidacy for degree the degree of A.B. based upon four years of work beyond secondary education in a college which is approved by one of the regional accrediting bodies or the equivalent of such a degree," but meet the standards of the Association in all other matters.

One trend is to increase the number of required subjects, and 25 per cent of the 62 schools reporting indicated that they had taken this action. At the same time, 12 per cent of the schools indicated that they had decreased the total number of required courses. Another trend is an increase in the number of theological professors in all denominations who have received the Doctor's degree upon completion of graduate work.

Curriculum Changes.—Some of the theological schools have organized "refresher" courses for chaplains who served in the armed forces. An increased number of the accredited schools are offering some instruction in radio. In 20 schools radio is taught as a part of a course in speech, journalism, practical theology, or religious education, while nine of the schools offer radio courses and three offer courses through colleges or universities with which they are affiliated.

Many of the schools now provide special training in counseling in recognition of the growing importance of that field as part of the life work of ministers. Field Work or a Clinical Year has become a part of the program of more theological seminaries. Sometimes the Clinical Year is the third year of the course, and in these cases the fourth year is organized to include seminar courses for the discussion of problems encountered during the Clinical Year.

The responsibility to develop the devotional life of seminary students rather than to depend upon the initiative of the students in this regard has been assumed by the seminaries in many instances, according to the findings of a recent study.

Recruiting for the Ministry.—The General Commission of Army and Navy Chaplains cooperated with the American Association of Theological Schools during biennium 1944-1946 in preparing and distributing 5,000 copies of a folder entitled "Have You a Man for the Vacant Pulpit?" "The Calling of the Protestant Clergyman" is the title of a brief occupational description which was published by the National Roster of Scientific and Specialized Personnel. The Federal Council of the Churches of Christ in America established Oct. 1, 1945 the Commission on the Ministry, and this Commission published 18,000 copies of a six-page leaflet called "Possibly the Ministry?" Chaplains aided in encouraging individuals to consider becoming ministers and during an eight month period obtained the names of 3,979 service men who were seriously considering the ministry as their life work. During the school year 1946-1947, area conferences will be held concerning church vocations and interdenominational approaches to independent college campuses. The commission on the ministry referred to above also planned three volumes of approximately 100 pages each under the general title of Ministry for Tomorrow with the titles for the three parts *Serve This Ministry, Look at the Ministry,* and *A Young Man's Viewpoint of the Ministry.*

TRAINING FOR SOCIAL WORK

Schools.—The American Association of Schools of Social Work issued a new list of member schools in February 1946. This list includes all of the graduate institutions offering graduate professional study. Some of the 47 schools included offer a standard one-year curriculum, while other schools offer a two-year curriculum leading to a Master's degree. A few of the schools listed also have organized a specialized program approved by the American Association of Medical Social Workers or one approved by the American Association of Psychiatric Social Workers. The list indicates that the University of Illinois' curriculum in Social Welfare Administration was approved for the first time in 1946.

The professional curriculum in all of the member schools is based upon a prerequisite of four years of undergraduate liberal arts study. The schools maintain approved programs of field work, and their faculties must meet certain professional and academic standards. The increased demand for social workers in recent years has encouraged an increase in the number of colleges and universities with organized training programs for social work.

Curriculum Trends.—While there have been no recent changes in the objectives of the professional education, they have been continually restated both for the sake of clarity and also to insure that they reflect current practice. Most of the recent developments grow out of the adoption of a new basic curriculum which took place in May, 1944. The eight basic subject matter areas included in this curriculum are social welfare administration, social case work, social group work, community organization, social research, medical information, public welfare, and psychiatry. The American Association of Schools of Social Work established a Curriculum Planning Committee to continue to define and implement the curriculum adopted in 1944. This Committee has been faced with the need of establishing norms for individual schools as the field of social work continues to expand. Whereas there is no desire to limit all schools to a standardized program, it is felt that there is a danger of the curriculum becoming so comprehensive and so diverse that real professional training might be sacrificed.

The Committee is attempting to devise two educational programs—one for the student who is preparing as a "social work specialist," and the other for the student who is looking forward to working as a "social work generalist." Naturally, it has been necessary for the two committees which have been appointed to think through desirable prerequisite courses on the undergraduate level as well as to study the possibilities of offerings in the graduate curriculum. One possibility being considered by both of the committees is the content which may be included if a third year of graduate study is added and also the possibilities of establishing requirements which would lead to a Ph.D. degree in Social Work.

Demand for Social Workers.—The

greatly increased demand for social workers, which began with the entrance of the United States into the Second World War, has continued partly owing to expanded services offered by cities, states, and the Federal government. It has been necessary to waive professional standards in many cases in order to secure sufficient personnel to carry on the work. Whether the number of social work positions will continue to increase during the next year may well depend upon general business conditions and the demands on the tax dollar by other public services.

ADULT EDUCATION

By J. O. Keller and H. G. Pyle
The Pennsylvania State College

GENERAL

The post-war period has seen programs for the formal education of adults developed on an immense scale under the stimulation of Public Laws 16 and 346, providing for veterans' education. However, while this vast program is an adult education program, it will not be described herein in so far as it pertains to full-time in-school education. This statement will concern itself only with out-of-school adults, those for whom adult educational programs are supplementary to their daily occupation or profession. Veterans returning to full-time study were resuming an interrupted full-time preparation for a career.

Conditions reveal a variety of needs for expansion of adult education programs of innumerable agencies in the field. Paramount is that of establishing international understanding on a basis which can bring a durable peace. It is obvious that such understanding does not come solely through councils of foreign ministers of the big powers; in fact, it may be least likely to appear for this reason alone. The cause can be advanced most significantly when the peoples of all nations have the opportunity for free discussion of the problems which tend to generate international conflict. For example, once there is popular understanding of the benefits of broad international trade and of the rights of small nations to have free access to raw materials, the more difficult it will become for a special interest group to press through legislation to the contrary. Adult education projects bring enlightenment and arouse interest in problems of national welfare. Such projects tend to bring forward leadership, aroused because of interest generated. On the community level the same principle governs. Local discussion of community problems tends to bring informed action.

Problems in all of these areas have highlighted needs for adult study. Nationally we have had reconversion problems incident to the return of our service personnel; of fiscal problems of a government returning to a peacetime basis; of national housing; and of industry with a working force tired from the war production effort and ready to scrap with management. It is the business of adult education to bring public understanding, for to the extent that public understanding is lacking, so also do democratic processes fail to function. Communities are entering into studies of their affairs hoping to plan for their people better centers in which to live. These are some of the areas to which adult education projects have addressed themselves in the post-war period. The war itself has been a costly lesson in adult education; slowly we are again learning that individuals, regardless of their station in life, do have certain inalienable rights.

Possibly the best overview of trends and interests in adult education in 1946 can be obtained from the program content of the Joint National Conference on Adult Education in Detroit in April, the first major meeting of its kind held. It was sponsored by the American Association of Adult Education, the Department of Adult Education of the National Education Association, Adult Education Board of the American Library Association, Educational Film Library Association, and National University Extension Association. Discussion centered around topics such as these: family life education, community group tensions, workers' education, education for veterans, leadership training, radio and television in adult education, community adult schools, adult education in rural areas, adult education and social change, and education's responsibility in major economic conflicts.

Another adult education conference of significance was one called at West Point by the Department of Adult Education (NEA) for state directors of adult education. It sought to emphasize the obligations of the public school system for adult education programs.

REGIONAL, STATE, AND LOCAL COUNCILS

Local, state, and regional councils of adult education continue to increase in number and activity. Councils dormant during the war are being reorganized. The Boston Center of Adult Education offered around 40 informal courses for adults in its summer session, featuring language courses and others. A fourth Southwest three-day regional conference on adult education was held at the University of Texas. It drew an attendance of 200 persons interested in such topics as training for business, industry and the public service, veterans' education, and home and family life. Similar conferences of state associations were held in several other states.

The New York State Citizens' Council held a three-day meeting in February 1946 to discuss housing, economics, and domestic problems and inter-group relations as they affect the community. At Saratoga Springs, a fourth annual State Citizens' Conference of the State Citizens' Council attended by 300 persons considered "The Community We Want." The New York state education department sponsors the state Community Service Council, an organization of young adults 18-30 years of age, functioning in 60 communities for the betterment of these local areas. The adult education councils of Denver, Cincinnati, and elsewhere continued to publicize adult education classes and events. The Springfield (Mass.) Adult Education Council provided 180 speakers to some 75 organizations in a brief period.

Cleveland's Adult Education Committee held an adult education institute and sponsored educational events for recent immigrants. In New York the second annual two-week institute of community leadership was held at Syracuse University. The Michigan council on adult education at its annual session passed a resolution calling on colleges to give maximum assistance in the preparation of teachers and leaders in adult education and urged public school officials to move forward more vigorously in the areas of social-civic education and home and family living. Provisions for use of the Bruce Fund for adult education were also discussed. Two outstanding projects were developed by the New York City Council. Discussion groups, in which the Council supplied trained leaders over a period of eight weeks, were held in 30 cooperating organizations. A second dealt with the development of personnel, volunteer as well as professional, for adult education organized jointly with the school of education of City College. Largely through efforts of the Council, 50 full-time adult teaching positions have been instituted by the Board of Education.

Outstanding activities of the Council of Greater St. Louis include a state equivalence high school certificate project; a survey of educational opportunities for veterans; a directory of programs, classes, and courses; and a survey of opportunities for vocational interests of adults.

LIBRARIES, MUSEUMS, AND PARKS

Libraries, museums, and parks contributed greatly to development of the adult education movement. Newark (N. J.) Public Library used special scholarship funds to provide a course in discussion group leadership for employees of its staff. In Charleston (S. C.) the County Free Library continued its interesting program of discussions on current events for members of that community. A branch of the New York Public Library, in cooperation with a television firm, planned a television institute designed to orient potential members of the new industry in the elements of writing, programming, and presenting telecast performances. Full equipment for television was installed in the library.

The Worcester (Mass.) Art Museum cooperated with the agricultural extension service in a project designed to interest farm women in the decoration of their homes. The Schenectady (N. Y.) Museum, in cooperation with the public schools, provided a program of evening classes for adults in such informal courses as weaving, art and music appreciation, and photograph tinting. The Cleveland Health Museum placed emphasis on the field of adult hygiene, using traveling exhibits under the caption "Live Long and Like It." The Buffalo Museum of Science offered a variety of informal courses ranging from elementary astronomy to fly-tying.

The National Parks Association recommended that the National Parks Service develop a suitable education program, using the natural features of the parks as instructional material. It was believed that the visitors to each primeval park should be informed of the special significance of that area and of the park system as a whole.

The Seattle Public Library began a series of film forums in October which will continue throughout the year. The Baltimore Museum of Art is unable to meet the wide demand for evening classes in crafts because of lack of work rooms and instructors. The Houston (Tex.) Museum of Natural History conducts a School of Natural History which has grown rapidly in enrollment since it was founded three years ago. The Colorado Museum of Natural History (Denver) has added an evening series on "Nature on the Screen." Baltimore's Museum of Art plans an extension museum for Baltimore's colored neighborhood. The San Francisco Museum of Art has arranged a series of lecture demonstrations on the modern dance and folk dance programs.

The executive secretary of the American Library Association at the Detroit conference pointed out among other things the following with respect to the obligation of libraries to adult education. First, the public libraries must concentrate on materials and services for persons who have a purpose in their reading; second, the libraries must be aware of the social, economic, political and cultural objectives and be prepared to help people advance toward those objectives; third, the library must cease to be a book library only and become a learning materials center; fourth, the public library must expand its information services and must also make its services attractive and useful to the large percentage of the population who now ignore the library.

RELIGIOUS EDUCATION

The National Academy for Adult Jewish Studies sponsored a fifth anniversary conference dealing with new directions for adult Jewish education and Jewish culture. The annual report of the Academy for 1946 lists effective adult education programs for those of the Jewish faith. The National Jewish Welfare Board lists the following current projects in the field of adult education: Jewish center lecture and concert bureau, Jewish book council of America, Jewish education department, Jewish music council, its services for the armed forces, and its women's division. Under this program 1,095 lectures were booked during the year, the creation of libraries to enrich study programs was stimulated, program material was supplied, a cultural program for American Jews advanced, and guides for those in the armed services prepared.

The Young Women's Christian Association stressed its program of leadership training and Christian education from the point of view of the personal life of the individual. Programs for better race relations were promoted and interracial activities initiated within the organization. A public affairs program dealt with citizenship education.

The Federal Council of Churches of Christ in America is the official agency through which 25 national denominations, comprising 140,000 local congregations with a membership of 27,749,967, joined in programs of religious education. Its various endeavors touched among others the fields of Christian social relations, marriage and the home, industrial relations and economic tensions, race relations, a just and durable peace, world service, and relief and reconstruction. The Young Men's Christian Association stressed particularly its guidance programs. Counsellors were trained and additional centers established to serve returning veterans. In Boston, for example, the veterans' service center conducted a job hunting school for training ex-servicemen in the techniques of getting a job. Job forums were conducted and radio programs set forth veterans' rights.

PUBLIC SCHOOLS

In New York the legislature approved a budget of $100,000 for department of education staff services in the field of adult education. It was planned that the appropriation be used to organize and supervise pilot community adult education programs.

The conference for state directors of adult education, at West Point in September, concluded that the state departments of public instruction and the public schools should play a major part in the continued growth of adult education. Many states have recognized this and have appointed a state director of adult education to the staff of the chief state school officer. Many other states are laying plans for the establishment of a statewide program of adult education. The conference studied the responsibilities and functions of state directors of adult education together with ways of carrying out these responsibilities and functions. The second purpose of the conference was to provide practice opportunities, a skill needed by state directors in carrying out their responsibility of developing increased in-service training of adult leaders. The United States Commissioner of Education was also urged by a resolution to establish a division of adult education with a director and staff to be coordinate with the division of elementary, secondary, and higher education.

Baltimore public schools outlined educational opportunities for returning veterans in a special publication. In Muskegon County (Mich.) 50 individual study groups were established under the Michigan state experimental adult education program. Philadelphia established extensive youth recreation-education programs in nine evening schools, and sponsored a leadership training program for its home and school council.

FEDERAL AGENCIES

Many agencies of the Federal Government carry on programs which can be classed as adult education. For example, the Children's Bureau, formerly of the U. S. Department of Labor but now a part of the social security administration of the Federal Security Agency, classifies much of its work as having to do with adult education. During the year, this Bureau gave special attention to the production of simple materials for parents. It also gives consultant service to a wide variety of organizations and individuals. Suggestions have been given in the preparation of radio materials for many of the broadcasting corporations. Help is provided in planning parent education courses and workshops. The Bureau took an active part in the organization and writing of materials for the Attorney General's conference on the control and prevention of juvenile delinquency.

The activities of the Tennessee Valley Authority in adult education center about problems of natural resources and their uses. The Authority, in its program, cooperates with established educational agencies. Through the agricultural extension services in the Valley, TVA provides information and materials for demonstrations of TVA fertilizers, of farm wood-lot development, and of improved use of electricity in rural areas. Through the state departments of forestry and conservation, educational activities in the Valley are directed toward a full understanding of forest and wild life as a key resource of the region.

For an appraisal of post-war needs and plans for the program of the Cooperative Extension Service, of the U. S. Department of Agriculture, carried on with the land-grant colleges, one can turn to the Kepner Committee Report on the "Scope of Extension's Educational Responsibility." The Committee felt that the extension service had reached a transition period in its development. Consequently it recommended certain adjustments in the distribution of total effort. The Committee felt that a maximum increase in emphasis was needed in the fields of (a) economic problems and public policies; (b) marketing and distribution; (c) certain segments of the field of social relations, adjustments, and cultural values; (d) farm home and buildings; (e) health, particularly the developing of a better understanding of the total rural health situation and methods of improvement through group action. It was also felt that problems in the field of production techniques which have historically commanded the major portion of extension effort might now proportionately receive somewhat less emphasis.

Thousands of younger men will be inducted into the United States armed forces in the next few years either voluntarily or through selective service. The question arises as to whether a two-year tour of duty will cause an educational blackout. The services plan to continue their program of education which operated on a broad scale during the war years. There are three official government organizations working in the educational field. One of these is operated by the Army —the Information and Education Division of the War Department Special Staff. In the Navy, there is the Educational Service Section, while the third agency operated jointly by the War and Navy departments is the United States Armed Forces Institute located at Madison, Wis. Both off-duty and on-duty classes are available to service men as well as a wide variety of correspondence courses through the Armed Forces Institute.

PROFESSIONAL ADULT EDUCATION GROUPS

Activities of the Department of Adult Education of the National Education Association include: (1) sponsoring of a national veterans' education conference in Cleveland, January 1946, and a second national conference on veterans' education scheduled for Memphis, Tenn. in January 1947; (2) a work conference for state directors of adult education at West Point; (3) plans for a conference of city directors of adult education and of secretaries and presidents of local and state councils and associations, scheduled for the spring of 1947; (4) offers services in helping state and local associations work out problems of organization and development; and (5) took the leadership in developing a joint national planning commission on adult education made up of representatives of the leading national associations on adult education.

The legislative committee of the National University Extension Association, composed of the extension divisions of 65 colleges and universities, is again planning to introduce in the 80th session of Congress, legislation designed to establish a general extension service which would supplement that now available from schools and colleges of agriculture. The American Association for Adult Education, beginning in the fall of 1945, has succeeded in reviving the various regional conferences on adult education which it supported more or less regularly in the years prior to America's entry into the war. The Association's *Inter-Council Newsletter* contains much of current information regarding activities of regional, state, and local councils. The Association is also one of the constituent members of the National Committee on Film Forums, and in March 1946 it began publication of a new periodical known as *Film Forum Review.*

Largely through the efforts of professional organizations of adult education, a resolution in support of adult education by the United Nations Educational, Scientific and Cultural Organization was adopted at its initial meeting in London. It reads: "*Whereas* the strength and stability of democratic government depends upon the force of enlightened public opinion, and, *Whereas* Adult Education has an immediate contribution to make to the enlightenment of the citizens of the world, *It is resolved:* That UNESCO be urged to establish close working relationships with the various adult education agencies, public and private, and that the Preparatory Commission, in elaborating proposals for the committee structure and the Secretariat of UNESCO, take full account of the need for adequate machinery designed to promote such cooperative relationships."

COLLEGE AND UNIVERSITY EXTENSION

Developments in university extension have been featured by great increases in the number of registrations for both class and correspondence study. These increases may be attributed to the veteran load. In correspondence instruction, contracts have been made by many institutions with the Veterans Administration. Many institutions established off-campus centers to offer full-time class instruction for veterans. Other colleges, beginning to recognize their adult education functions, are taking formal action by establishing schools or divisions of "non-resident or adult instruction" or of "public service." The urgent need still exists for Federal subsidy to general extension in the manner in which extension services of schools and colleges of agriculture are supported.

The University of Wyoming has established a department of adult education and community service. The University of Wisconsin extension division established industrial supervision institutes, consisting of one-week courses for key workers in industry and business, designed to develop greater effectiveness among management and foremen personnel. Rochester Evening Community College registered 740 adult students. The University of Minnesota's Center for Continuation Study, in cooperation with various labor groups, carried on an institute on atomic energy.

Roosevelt College (Chicago), in its newly established activities, features evening adult courses to give equal higher educational opportunities to all having the ability and determination to profit from them. The Pennsylvania State College opened additional new technical evening schools, making a total of 13 such schools it operates in the state. Registrations for the first semester totaled approximately 3,000, 78 per cent of whom are veterans. The University of California offers refresher courses for doctors dealing with general principles and recent advances in medicine, public health, surgery, and related basic sciences.

At Mississippi State, ten community workshops of five weeks' duration for educators have been held, attended by 1,000 administrators, teachers, rural ministers, and welfare workers from 35 counties. A college extension center has been opened at Vicksburg with the laboratory facilities of the Mississippi River Commission being used. Forty-five counties are represented in the correspondence instruction registrations of the University of North Dakota. At the University of Arizona, registrations for correspondence and class instruction exceed all previous records. The most significant development in adult education at Purdue University has been the rapid expansion of the technical institutes. Units are now operated in Indianapolis, Muncie, Anderson, Fort Wayne, Gary, La Porte, Michigan City, and Hammond. Student enrollment in these centers has doubled each year for the past two years. Other interesting developments at Purdue include the life insurance marketing institutes and short courses for accident and health underwriters.

At the University of New Hampshire general extension in 1946 entered the field of industrial activity. An industrial conference attended by 300 foremen and supervisors from industry was held. Similar activity was begun in the field of liberal arts. At Rutgers University, extension courses are being given in behalf and at the request of professional organizations and government units such as the New Jersey Department of Institutions and Agencies. At The Pennsylvania State College veterans' advisement centers have been established in eight centers in the state in cooperation with the Veterans Administration. The close of the year will see approximately 8,000 veterans guided and counselled in these centers.

The University of Missouri's previous activities in the field have been reorganized into a new unit "adult education and extension service." There are six subdivisions indicating activity of this unit: community service; veterans' training, extension, and teaching; correspondence and records; visual education; and evaluation. An interesting farm training program for farm veterans has been organized in cooperation with the Veterans Administration, and a continuous in-service teacher training program is another feature of the Missouri program.

In university extension at the University of Nebraska 400 to 500 veterans have registered in a special supervised study laboratory. Sales of correspondence course syllabi in this field to other institutions will total at least 35,000. A general increase in calls for extension work in art is also noted. One-day art workshops for teachers are being held over the state with the financial assistance of a $6,000 grant from the Carnegie Corporation. Other features of the service include a community program service, a labor college, and an institute on small community life. The division of general college extension at the State College of Washington notes a greater demand for extension instruction in the technologies and related industrial arts growing out of the industrialization movement in the Pacific Northwest. Great interest is also indicated in family life education and in a counselling service for parent study groups.

In Indiana University previous activities have been reorganized under a division of "adult education and public services." Greatly increased enrollments in extension class centers have been noted, arising chiefly from registrations of veterans. Requests for audio-visual materials are the greatest in the history of the university. Group discussions of great books is another project which has been extremely popular.

The director of university extension at the University of South Carolina notes the acquisition of a permanent home for the Opportunity School. It is operated by the State Department of Education and located at the Columbia Army Air Base. At the University of Idaho a new unit combining many former separate activities has been formed called "division of educational field service." At Ohio University 900 students are enrolled in off-campus branches in Portsmouth, Chillicothe, and Zanesville. The University of Connecticut notes, among the more significant trends in adult education, that of adults seeking training in the technics of community leadership and in the area of more effective group living. Practically every high school in North Dakota is using correspondence courses offered by the North Dakota Agricultural College.

Montana State University's extension division has undergone a reorganization designed to give greater emphasis to adult education. The new unit is called "division of public service." A study in Montana, financed jointly by the Rockefeller Foundation and the six institutions that comprise the University of Montana, has been instituted to find ways and means of stabilizing and enriching life in the rural communities. At the University of Iowa a series of conferences have been held dealing with the subject "What's Ahead in Adult Education?" Five visual education teaching conferences have also been held in larger cities of the state as well as a conference on inter-American affairs and another on school administration and supervision. Refresher courses and institutes in law, dentistry, medicine, and engineering have been held for professional men returning from the armed forces. The University's radio station WSUI has continued to make significant contributions during the year to adult education with its broadcasts from the classroom.

The University of Texas carries on a broad program of university extension. One staff member devotes considerable time to visiting colleges in the state holding discussions with faculty and others on the need for universal adult education. Evening classes have been opened up in a great many centers though such units are in great need of financial assistance. Demand for extension classes has been much greater than the division of extension has been able to meet. The extension program at the University in industry and business in 1945-46 reached approximately 24,000 adults in 365 communities in Texas. Enrollment in correspondence totaled 5,518. The division of general college extension at Rhode Island State features short courses in life insurance and a personnel and tax institute. Full-time centers for veterans have been established, and a workers' education program is in progress.

WORKERS' EDUCATION

In the midst of great industrial strife during the year, it was believed by many that a program of labor education wisely planned and conducted could do a great deal to forestall labor disputes and promote better labor-management relations. One of the most significant developments in this field consisted of plans made by the Committee for the Extension of Labor Education for the introduction of legislation which would provide for a labor extension service similar to the agricultural extension service. Such a service would be established in the Department of Labor. A bill providing for such an agency was introduced in the 79th Congress, and plans are underway for introduction of a revised bill in the 80th Congress.

In Seattle, a labor school was established with a board of 17 directors representing labor and educational organizations. The California Labor School in San Francisco reported an enrollment of 1,200 students. The School for Workers at the University of Wisconsin sponsored a local radio program as well as a number of summer institutes. At The Pennsylvania State College, 400 local officers of the United Steelworkers of America attended one-week institutes in July. Instructors were members of the faculty of that institution. These institutes were the forerunner of a planned extension program for the 250,000 members of that union in Pennsylvania. The International Ladies' Garment Workers plan to establish community radio stations in a few selected areas.

The American Labor Education Service stressed the need to strengthen education as it relates to the alleviation of racial tensions, labor's role in government, and workers' education on the part of universities. This agency offered opportunities to colleges and universities for discussion of their functions and purposes in their contact with the labor movement. The 25th annual convention and conference of the Workers' Education Bureau of America took place during the year. Its activities over this period fall into these categories: institutes and conferences, assistance to labor organizations, public relations, research, publications, radio programs and others. Its program of labor institutes has been notable.

WOMEN'S GROUPS

The League of Women Voters, an aggressive organization in the field of adult education, found its membership increasing 25 per cent in the two-year period ended April, 1946. Progress has been made in decentralizing League activities so that local leagues run a number of neighborhood discussion-action groups. Beginning in 1947 a campaign featuring the use of film strips and pamphlets is being started to have people consider and discuss basic economic facts.

The American Association of University Women's adult study program continued to center about education, art, status of women, social studies, and international relations. Emphasis particularly was on an educational program dealing with community matters—housing, health, and recreation. Possibilities in living under a $1,500-a-year family budget for four persons were discussed by local clubs. Art exhibitions were sponsored in 71 communities. Local and national legislation also received attention. The main feature of the national program of the General Federation of Women's Clubs in 1946 was its youth conservation program. Club women were instrumental in establishing youth councils and youth centers in hundreds of communities. Surveys as to needs of young people in the fields of health, education, recreation, and family life were carried on. Other programs dealt with the United Nations cause, inter-American understanding, and the Federation's national legislative program.

In general there was some evidence of a trend away from use of programs prepared by a central office and sent out in large quantities to local branches, in favor of more vigorous programs rooted in local situations and needs.

METHODS AND MATERIALS OF ADULT EDUCATION

The American Association of Adult Education planned a new edition of its *Handbook of Adult Education in United States* to appear in 1947. The National Committee on Film Forums, composed of representatives of four national agencies, sponsored a quarterly publication *Film Forum Review*. *Parents Magazine* established a parent education clearing house. The National Congress of Parents and Teachers prepared a special publication setting forth facts on the formation and activities of the United Nations Organization. The Woodrow Wilson Foundation (New York) sponsored a monthly publication, *United Nations News*. The National Committee on Atomic Information published a kit on atomic energy for study groups.

One of the striking developments of the war period was the steady rise in use of 16 mm. motion pictures and other instruments and media of adult education. With hostilities now ended, this development continues to go rapidly ahead. During the war period the U. S. Office of Education produced 457 sound motion pictures, 432 silent film strips and 457 instructor's manuals. During this same period the armed forces collected a total of approximately 22,000 prints of sound motion pictures. All of these films used for war production purposes are now available to schools and apprentice training programs in industry. Public libraries are rapidly becoming aware of their role in using and distributing motion pictures and have started film divisions. The membership of the Educational Film Library Association numbers quite a few public libraries as well as a great many other agencies interested in the production and distribution of visual aids for educational purposes. During the year it started a film evaluation project. The Cleveland Public Library's film bureau is assisting in film forums on inter-racial relationships. The Akron Public Library established a film collection as a part of its Group Service Division while the Brooklyn Library last year put on a series of film forums. Experimental film forums are planned by the Albany Public Library.

Obviously this summary is in no sense an exhaustive one but it is representative of organized efforts made by many agencies to further objectives referred to.

NEGRO EDUCATION

By William Anthony Aery
Administrative Assistant, NACA Langley Memorial Aeronautical Laboratory

GENERAL

Negro education during 1946, despite labor-management flare-ups and political confusion in Georgia and Mississippi, as well as a race riot in Tennessee, moved steadily forward. White liberals in the South, including Governor Arnall of Georgia, President Graham of the University of North Carolina, and Virginius Dabney of Virginia, spoke out clearly in favor of better race relations. Departments of education in southern states devoted more personnel to the problems of Negro education. The Federal Government, through the U. S. Office of Education, gave wider and fuller service to workers in the field of Negro education.

The education of Negroes in 17 southern states and the District of Columbia is a severe tax on the region's economic resources and development. For the year 1943-44, according to *Statistics of State School Systems* (published in 1946 by the U. S. Office of Education), the following figures were given: Estimated school population 5.17 years of age, July 1, 1940 (U. S. Census), 2,827,565 (white, 8,915,305); percentage distribution of school population, 24 (white, 76); enrollment in elementary and secondary schools, 2,276,742 (white, 6,893,598); instructional staff, 66,553 (white, 245,629).

Some southern states with especially large Negro school populations, for which education must be provided or limited economic income, are as follows: Alabama, 228,468; Arkansas, 99,999; Georgia, 256,023; Louisiana, 163,248; Mississippi, 272,495; North Carolina, 256,634; South Carolina, 204,942; Tennessee, 102,734; Texas, 199,547; and Virginia, 142,841.

The total current expenses for 10 Southern states ranged as follows: Alabama, $4,867,258; Arkansas, $2,034,653; Florida, $4.043,500; Georgia, $4,662,107; Louisiana, $5,513,782; Maryland, $4,525,421; Mississippi, $2,622,077; North Carolina, $10,907,205; Oklahoma, $2,972,210; and South Carolina, $4,267,345.

ELEMENTARY EDUCATION

The crux of Negro education is the growth of good elementary schools, especially the grade, distribution of pupils, and the increase in the number of accredited elementary schools. The latest report on the Negro elementary school enrollment gives a total of 2,029,368, or 89.1 of the total Negro school enrollment. For whites, in the same area, the total elementary school enrollment figure is 5,407,849, or 78.4 of the total white school enrollment.

SECONDARY EDUCATION

The enrollment in Negro high schools, while it is about 50 per cent what it should be on the basis of population, has been increasing at a fair pace and will undoubtedly increase as the South improves its economic status. During 1943-44 (latest available), there were 247,347 Negroes, or 10.9 per cent of the Negro school population in high schools. For whites, in the same area, the total high-school enrollment was 1,485,649, or 21.6 per cent of the total white school enrollment. The distribution of Negro high-school pupils was as follows: boys, 84,886; girls, 162,488. The Negro high-school instructional staff of 11,330 was distributed as follows: Supervisors, 34; principals, 789; teachers, 10,507 (men, 3,658; women, 6,849). The high-school graduates numbered 31,180 (boys, 8,338; girls, 22,842).

HIGHER EDUCATION

For the Fall term 1945-46, according to Prof. Martin D. Jenkins of Howard University (*Journal of Negro Education,* Spring 1946), 105 Negro institutions enrolled 41,741 resident undergraduate students, an increase of 15.7 per cent in 96 institutions over 1944-1945. The distribution was as follows: male, 9,601; female, 32,127; or 23 per cent *vs.* 77 per cent. Of the undergraduate population, 16,723 freshmen, the males were 27.6 per cent, and the female, 72.4 per cent, an increase of 12 per cent over 1944-1945 (male increase, 43 per cent; female increase, 9 per cent). The 4,556 male freshmen constituted almost exactly half of the total male enrollment reported.

During the school year 1944-45, according to Professor Jenkins, a total Negro college population of 65,958 was reported as enrolled in 101 institutions. The 37 public-controlled institutions enrolled 19,384 students, or 46.4 per cent of the total. The 68 privately controlled institutions had an enrollment of 22,357 Negro students, or 53.6 per cent.

The 39 institutions fully accredited by their regional associations reported an enrollment of 25,893 students, or 62 per cent of the total; the 25 institutions not fully accredited reported 9,535 students, or 22.8 per cent; and the 41 institutions not accredited reported 6,313 students, or 15.2 per cent.

Generally speaking, the 113 Negro institutions of higher education are relatively small in enrollment. The median institution has an enrollment of approximately 310 students. In short, as of the Fall 1945-46, some 44,000 Negroes were enrolled in Negro colleges and universities—"the highest in the history of these institutions," according to Professor Jenkins, and the enrollment for the school year 1944-45, including summer session and extension classes, was approximately 70,000 students. It should also be noted that the Fall term enrollment was about 10 per cent greater than in 1941-42, the previous peak year, despite the fact that the male enrollment was well below normal.

Dr. Thomas W. Turner of Hampton Institute, published his findings on "Science Teaching in Negro Colleges" (*Journal of Negro Education,* Winter 1946). Twenty-seven colleges stated that they were preparing students for the field of science teaching, 24 for medicine; 19 for dentistry; 14 for home economics; 13 for general agriculture. The offerings in natural sciences generally omitted geology and astronomy. Not a single Negro college shared in the Federal funds for experiment stations "as would enable it to organize and develop the vocational aspects of the sciences similar to that which is done in white State colleges in the South." Dr. Turner added: "The absence of the experiment station opportunity is the missing link in the vocational education of Negro youth, especially in those institutions [Negro land-grant colleges] which offer training in agriculture, home economics, in the areas of plant and animal nutrition, and in the physical and engineering sciences."

This well-known Negro biologist outlined functional programs for teaching in the areas of plant, animal, and physical sciences. He closed his findings as follows: "In neglecting the physical sciences the Negro colleges are not only ignoring the trends pointing to the largest field of job activity for the future, but they are neglecting also the present-day observations as to what science equipment is most useful for earning a living at present and in succeeding generations."

The vastly increased number of Negro college students has lead to the overcrowding of dormitories, laboratories, and classrooms, as well as the unwarranted taxing of instructional facilities and the failure to provide students with an adequate educational environment.

English composition classes of 80 students and elementary language classes of 60 students, taught by a single teacher without assistants, have not been too uncommon in Negro colleges. Then too, Negro college students have been enrolled, taught, failed, and dropped, without an interview "and without an evaluation by the college of their abilities or disabilities."

AIMS OF THE LIBERAL ARTS COLLEGES

The aims of the Negro liberal-arts college, which are ill understood by whites, are summed up in the following statement, prepared for Talladega College (Alabama) but applicable with reasonable modifications, to other institutions that attract young Negroes who are non-vocational in their interests:

"Talladega College . . . does not bid for the attendance of men and women who have no serious purpose in entering college, but it welcomes the student of genuine intent and superior ability. The College aims to provide, under guidance, an opportunity for vital contacts with inspiring men and women with the important areas of knowledge, and with varied experiences in living by means of which the student, in his fundamental task of building a personality, may grow. . . . The student is expected to make reasonable progress in the acquisition of usable information concerning the general nature of things and of men . . . progressive mastery of a chosen field of study . . . the mastery of such skills and techniques as are needed for effective living; and the constant practice of constructive attitudes which will lead him to promote the common welfare."

FISK UNIVERSITY

Dr. Charles S. Johnson, Negro sociologist, was elected president of Fisk University (Nashville, Tenn.). Oct. 29, 1946 to succeed Dr. Thomas E. Jones, now president of Earlham College (Richmond, Ind.). Dr. Johnson had previously been named by President Truman as a delegate to the United Nations Educational, Scientific, and Cultural Organization. Earlier in 1946, he was a member of a committee of 26 American educators sent to Japan at the request of General MacArthur to aid in revising the Japanese educational system. He is a trustee of the Julius Rosenwald Fund, having served since 1934, and also director of the Race Relations Forum of the American Missionary Association, which founded Fisk University 80 years ago.

The Fisk trustees set the 1946-47 budget at $664,000 to care for an enrollment of 227 men and 555 women. Eighty-five men came from the armed forces, 73 per cent of whom are freshmen. In 1945, Fisk received $44,900 from United Negro College Fund, Inc. The present endowment of the University is $3.900,000, and the plant value is $1,700,000, more than three times the value of the institution in 1926.

On April 26, Fisk opened an international student center in which American Negroes will have the opportunity of becoming acquainted with the cultures of other lands. This was made possible by gifts from Miss Margaret Shaw Campbell. The director is Evadeane Kemp, formerly associated with International House in Chicago.

POST-WAR PROGRAM FOR NEGRO COLLEGES

Post-war education in 34 Negro colleges in 19 states, on the basis of Federal survey, involves the following expenditures, according to Dr. C. L. Spellman, professor of education at the Florida A. and M. College (*Journal of Negro Education,* Spring 1946): for proposed additions, from $100,000 in one college to $3,000,000 in another; two-thirds of the colleges propose improvements valued at $250,000 to $1,500,000. In short, about two-thirds of the Negro colleges plan to spend between $500,000 and $1,000,000 for dormitories, special subject-matter buildings, health and physical education facilities, as well as faculty living quarters. The Negro colleges also propose to increase somewhat the teaching personnel to take care of sub-college work for veterans.

FINANCIAL CAMPAIGN

In April 1946, there opened the third annual campaign of the United Negro College Fund (John D. Rockefeller, chairman) to raise $1,300,000 for 33 Negro private colleges. Frank M. Totton, national campaign chairman, said: "Faced with the responsibility of educating thousands of returning veterans, the already heavily burdened facilities of these institutions are being placed under pressure that demands assistance if the need is to be met. We intend to campaign vigorously this year to assure that the fund is able to give that assistance in full measure, as a necessary step to improving living standards for one-tenth of our population."

An advisory committee of 82 prominent men and women throughout the country is serving in this campaign. The daughter of former Chief Justice Charles Evans Hughes, Mrs. Chauncey L. Waddell, was named chairman of the New York women's committee whose quota is $200,000.

The New York Times (Apr. 7) spoke editorially as follows: "The Negro played an important, and often heroic part in the war. He shared the mud, the danger, the sweat, and the tears. Now he has the right to continue his interrupted education, if he wants to do so. Many college doors will be closed to him and to others, regardless of race, color or creed, simply because there are too many returning veterans to be cared for at once in the colleges of their choice. But we cannot allow these 33 Negro private colleges to turn away any applicant because they lack funds, or to curtail their programs because of it. . . . As we mutually put a proper, unprejudiced estimate on the contributions of all races to the common good, we are more surely closer to the goal of living together in harmony."

LAND-GRANT COLLEGES

The Conference of Negro Land-Grant Colleges, at its summer meeting, adopted resolutions covering service to agricultural extension, Federal aid to education, full employment, improvement of inter-group relationships, national security, education of veterans, and reorganization of the U. S. Office of Education. The report of the Committee on Resolutions was printed in *School and Society* (Aug. 31).

The presidents of the Negro land-grant colleges agree upon the following program of work for the immediate future:

(1) Serve rural people through agricultural extension by adding Negro personnel, more public funds, and larger participation of Negroes in the administration of services among their own people.

(2) Secure Federal aid for education so that all individuals, regardless of race, creed, or origin will share equitably in new educational facilities.

(3) Urge upon employers the use of all citizens, regardless of their racial, religious, or social status, and also urge that official provisions be made for the use of the services of qualified Negroes in all phases of governmental life.

(4) Assume moral responsibility of having Negro land-grant colleges work actively toward improving human relationships, especially in the South, since "all human beings are essentially the same in mind, body, and spirit."

(5) Help to establish in Negro institutions standard ROTC units and other Federally supported training programs.

(6) Give wise and sympathetic counsel to frustrated Negro veterans who seek effective training and then check carefully their placement so as to help effectively those who labored patriotically to achieve a democratic ideal.

(7) Cooperate with the U. S. Office of Education to improve its organization and secure adequate funds for its rapidly expanding program.

PROFESSIONAL EDUCATION

Professional curricula for Negroes were offered on a limited scale in eight institutions—Atlanta, Howard, Lincoln (Missouri), Lincoln (Pennsylvania), Meharry, North Carolina College for Negroes, Virginia Union, and Xavier—in the following fields: Law, three institutions, social work, two; pharmacy, two; library science, one.

The evidence is clear that more attention should be given to training Negroes to be of professional service to their race, even though some excellent work is being done in Negro and non-Negro professional schools, and a start in the right direction has been painfully made toward helping qualified Negroes win professional efficiency.

The dire need of trained Negro physicians for the Harlem area of New York City was forcefully outlined by Mrs. Edith M. Alexander (Mayor's Committee on Unity) in March 1946 before the City-wide Citizens Committee on Harlem. Mrs. Alexander (Negro) urged the New York City government to train more Negro physicians and to allow for the appointment at Lincoln and Bellevue hospitals of qualified physicians.

In addition to 264 Negro students enrolled in dentistry at Howard University and Meharry Medical College, Dr. Clifton O. Dummett discovered 24 Negroes who were studying dentistry in 12 non-Negro institutions (*Journal of Negro Education* Winter 1946). When the dental needs of the vast Negro population is considered, there can be no question that some intelligent effort should be made to attract to dentistry some of the Negroes who are now going into medicine and kindred fields. More funds, too, are needed to provide physical facilities for the modern teaching of dentistry.

EDUCATION OF NEGRO WOMEN

Bennett College (Greensboro, N. C.) held its annual home-making institute in March 1946. President David B. Jones emphasized the importance of Negro women taking more interest in business education, since already nearly 50 per cent of the more progressive Negro business enterprises are owned or operated by them. President Jones announced a post-war program to complete an endowment fund of $2,000,000 and a building fund of $300,000. It is planned to continue Bennett College as an institution for the training of Negro women in the liberal arts, with emphasis upon home-making. The present enrollment is 412, with a teaching staff of 38.

GRADUATE EDUCATION

Fourteen Negro institutions reported a total of 576 graduate students, enrolled during the Fall term 1945-46 (male 30 per cent; female, 70 per cent).

Dr. W. D. Funkhouser, dean of the Graduate School, University of Kentucky and president of the Conference of Deans of Southern Graduate Schools, prepared for the *Journal of Negro Education* (Winter 1946) a detailed report on "Graduate Work in Negro Institutions in the South."

In May 1945, the General Education Board (New York) appropriated $5,000 to be used for a series of regional conferences on graduate work for Negroes, held in Durham, Atlanta, Nashville, Jackson, and Prairie View.

"The white deans," according to Dr. Funkhouser, "made it a point to allow the Negro representatives to take the lead in the programs and attempted to guide the discussions into the channels most desired by the Conference. . . . The papers were presented almost entirely by the Negro educators. . . . The more vital topics included the needs of the region for graduate work in Negro institutions; the actual work now being done; the potential Negro graduate-student population of the region; the opportunities available for these students; the present resources for graduate work in the area concerned; the problems involved in graduate instruction and research; the extent and condition of physical plants; and particularly the available library facilities. Most of the papers presented had been carefully prepared; some were very scholarly; and all showed a serious and honest attempt to evaluate the present status of Negro graduate work and suggest the acute needs of both the present and the future."

Segregated graduate schools for Negroes have already become extremely expensive. R. I. Brigham ("The Price of Segregation," *Survey Graphic,* March 1946) pointed out that Missouri had spent more than $500,000 to graduate one Negro student from the School of Law and ten from the School of Journalism. *School and Society* (May 18) pointed out that "this practice will grow worse financially as qualified Negroes request training in engineering, mining, medicine, and other graduate fields."

TEACHER EDUCATION

Teacher education in Negro institutions has taken on new meaning during recent years because of the expanding rôle that Negro citizens have begun to play in American economic life and the consequent need of giving better training to Negro men, women, and children.

Dr. Virgil A. Clift, professor of education and director of veterans' education at the North Carolina Agricultural and Mechanical College (Greensboro, N. C.), presented an excellent report on "Criteria for Teacher Education in Negro Institutions" (*Journal of Negro Education,* Spring 1946).

His criteria emphasized that they (a) should exemplify democratic living at its best and the curriculum should provide students with experiences which provide an adequate understanding of the growth of children and adolescents, understanding of the nature of society and the individual; (b) should strive to develop in its students characteristics that are essential to a democratic personality; (c) should develop in its students competencies that are essential to a democratic teacher and help them obtain a comprehensive understanding of the fields in which they are to teach; and (d) should imbue its students with the desire and techniques by which they may become progressively better adjusted as a minority group in American culture.

Mrs. Catherine W. Duncan, director of field training and associate professor of education at Fort Valley State College (Georgia), outlined (*Journal of Negro Education,* Winter 1936) an effective program in Negro teacher education. Provisions have been made for faculty members to visit rural schools, homes, and churches; to become acquainted with state and county agencies engaged in rural improvement; and to meet and know children and adults of rural communities. Fort Valley State College aimed to have its students know intimately the life of Negro people by sending those ready for practice teaching to rural communities, where they have bought and cooked their own food, as well as managed their own daily living. The College also conducted on-campus "home" workshops in which teachers worked on their everyday problems. This work was supplemented by demonstration schools in which teachers could put directly to the test what they had learned from their instructors, their textbooks, and their laboratories.

The Atlanta University system of practice-teaching, in operation at Clark, Morehouse, and Spellman colleges, grew out of a conference which was called in 1940 by Dr. H. Reid Hunter, Assistant Superintendent of Atlanta public schools. A supervisor of teaching practice was appointed to serve as the coordinator of work to be done by four institutions. Education seminars for prospective elementary and secondary teachers paralleled the students' observation and practice-teaching in the senior year and brought into close association students and faculty members who worked over materials in such courses as psychology, sociology, curriculum-making, and methods of teaching. These conferences promoted cooperative thinking and democratic processes.

During the summer school term, Hampton Institute offered four workshops in guidance, supervision, high-school dramatics, and audio-visual aids in education. It also offered a three-week institute on problems in the teaching of arithmetic.

VETERAN EDUCATION

Virginius Dabney (Richmond, Va.), outstanding and fearless Southern liberal, stated that, though the number of returning Negro ex-servicemen is far larger than it was following the First World War, these Negroes have been living quietly throughout the South. "One reason for this," he adds, "may lie in the fact that they feel the lot of Southern Negroes has improved during their absence. Such things as abolition of poll taxes, equalization of teachers' salaries in the public schools, employment of Negro policemen in the Negro sections of Southern cities, and appointment of Negroes to positions of trust by Southern Governors and Mayors have seemed to lessen tensions" (*The New York Times*, March 3).

The representatives of 52 Negro colleges and 127 high schools met at Tuskegee Institute (Ala.), Dec. 4-5, and, by resolution, urged the Veterans Administration "to make it mandatory to employ competent Negro personnel in advisory and counseling agencies." These representatives at the thirteenth annual convention of the Association of Colleges and Secondary Schools endorsed the vocational opportunity campaign of the National Urban League; commended President Truman for including President F. D. Patterson of Tuskegee on the Commission on Higher Education; and petitioned the Federal Government "to unify and provide more effective distribution of surplus properties."

Negro colleges were somewhat divided in their attack on the veteran-education problem. According to Professor Spellman, 19 colleges expressed the opinion that veterans could best take care of the education of veterans; two believed that either colleges or high schools could perform the task equally well; and others offered no solution. Some 75 per cent of the Negro colleges expressed the opinion that regular staff teachers could best handle veterans, assisted, of course, by a few specialists. This situation will spread even more thinly the supply of Negro college teachers. Eleven colleges anticipated a change in teaching techniques, owing to the presence of veterans; 15 did not anticipate any movement toward the introduction of intensive methods which were developed by the Army and Navy during the Second World War. Ten colleges expressed faith in Army-Navy teaching methods; ten, opposition; and 11, uncertainty as to their value.

Eighty-seven Negro educational institutions reported a total veteran enrollment of 1,973, which included students on the secondary and college level.

ADULT EDUCATION

The Carnegie Corporation (New York) made a 5-year grant in August of nearly $24,000 for the purpose of raising the level of education among Negro adults, according to Dr. John W. Studebaker, chief of the U. S. Office of Education. The Census of 1940 classified nearly 3,000,000 Negroes as "functionally illiterate," that is, persons 25 years of age or over who had completed less than five years of school.

The first phase of the project was a conference, held in Washington, D. C., under the leadership of Ambrose Caliver, director, who is the specialist in the higher education of Negroes in the U. S. Office of Education. Programs, facilities, and materials developed in the field of adult education were presented by J. A. Atkins, Federal Works Agency; G. N. Redd, Fisk University; and Victor Morey, Immigration and Naturalization Service. The Washington conference was attended by 60 representatives from all levels of education and from various educational associations.

Hampton Institute held in March its fifth annual conference on adult education for Negroes, under the auspices of Associates in Folk Education, American Association for Adult Education, and its own extension department. Discussions dealt with such topics as methods of adult education, labor problems, world affairs, and educational problems specially significant to American Negroes.

To combat illiteracy among Negroes, Hampton Institute held (Aug. 12 to Sept. 14) an Institute on Adult Education, sponsored by the U. S. Office of Education, American Association for Adult Education, and National Conference on Adult Education, and financed by the Carnegie Corporation (New York).

Veterans who had taken part in the Army's wartime program for eliminating illiteracy joined with a group of educators, social workers, and college administrators in teaching teachers to handle illiterates, to prepare teaching materials, and to test newly acquired methods in class demonstrations.

The experimental group of 30 men and women will carry the new techniques and materials to new centers throughout the South and, in turn, many more teachers will learn how to help Negro illiterates. Those who learned at Hampton Institute will serve through educational institutions rather than as separate teaching units.

Paul A. Witty, former major in charge of the Army program for illiterates and now professor of education at Northwestern University, demonstrated the methods by which the "three R's" were taught illiterate service men in eight weeks. Negroes constitute one-third of the American illiterate group of 10,000,000 citizens.

RURAL EDUCATION

Alethea H. Washington presented a valuable set of 101 readily accessible references on rural education in the *Journal of Negro Education* (Spring 1946), grouped under the following headings: Dissertations and theses (taken from E. O. Knox's annual "Review of University Research Pertinent to the Negro"); books, reports, and bulletins; and periodical references. Her aim was to help men and women who are concerned with the problems of Negro rural education. Her hope was expressed that this list "would add to the evidence as to whether the condition of depressed groups should continue to be a live issue in the minds and hearts of thoughtful and progressive educators."

During the Summer of 1946, the Julius Rosenwald Fund made its final grants in teacher education to Fort Valley State College (Georgia), Tuskegee Institute (Alabama), and Jackson College (Mississippi). The rural schools in the counties in which these Negro schools are located have been vastly improved through the additional state appropriations which the Rosenwald aid helped to bring to the improvement of Negro education. In 1946 the Fund concluded its work in the development of rural-education study materials for children and teachers. For the period 1944-1946 the Fund expended slightly over $100,000 on rural-education projects in Negro colleges and $111,295 for other aspects of rural education. For the period 1934-1946 the Fund expended a total of $1,640,364 on the preparation of rural teachers and the development of rural education.

Prairie View State College (Texas) conducted an effective and extensive program of Negro rural education—a series of state conferences on rural life and education; county and local surveys; extension services; co-operation with the Jeanes system of supervising teachers field projects in community education; and co-operative community-education workshops.

Georgia State College (Savannah) served Negro rural education through its Log Cabin Community Center. It is also headquarters for Negro membership in the American Country Life Association.

Virginia State College (Ettricks) conducted off-campus workshops for Negro rural teachers and continued its reading projects for Negro adults in Chesterfield County.

Alcorn Agricultural and Mechanical College (Mississippi) employed four faculty members to serve as specialists in Negro rural education.

Pine Bluff College (Arkansas), through trained "key teachers," demonstrated better rural teaching practices throughout the state and maintained a standing faculty Committee on the Study of Rural Conditions.

South Carolina Agricultural and Mechanical College (Orangeburg), in cooperation with the Penn School (Frogmore, St. Helena Island), sent groups of seniors, for six-week periods, to help the Negro rural island population improve their schools.

Southern University (Baton Rouge) conducted projects in Negro rural education for the teachers of Washington Parish.

Mabel Carney, professor of education, retired, Teachers College (Columbia), supplied for the *Journal of Negro Education* (Winter 1946) valuable references dealing with college and university material on rural education which would serve Negro leaders and teachers.

HEALTH EDUCATION

The problem of health among Negroes is vitally related to their problem of education. Because the venereal disease problem is a major health hazard to the American Negro, the United Negro Insurance Associations, assembled for a convention in New York City, July 9-12, endorsed, by official resolution, local and national social-hygiene programs and pledged active support to such programs in their home communities. This endorsement was given by the representatives of 61 national Negro insurance companies and 10 regional associations. Roger F. Gordon, executive secretary of the Harlem Council on Social Hygiene, stated that Negro leaders had expressed the determination to eradicate among Negroes the menace of venereal diseases (*Social Hygiene News,* Dec.).

The North Carolina Tuberculosis Association, as a phase of its Negro health-education program, conducted a high-school essay contest and offered $3,000 to the School Health Coordinating Service for scholarships in health education to teachers at the University of North Carolina and at North Carolina College for Negroes (Durham). It also made a grant of $500 to help establish a course in public health education for Negroes.

VOCATIONAL EDUCATION

The National Urban League, which aims to improve industrial conditions for Negroes, held its fourteenth Vocational Opportunity Campaign (March 10 to 16). The slogan was: "The Future Is Yours—Plan and Prepare." Negro youth was invited to carve out its own future by training for jobs, choosing jobs, getting jobs, and keeping jobs. White citizenry was challenged to recognize the fact that, until economic equality for Negroes is fully established, "our vaunted democracy is weighed in the balance and found wanting." Fifty-four cities in 27 states, 50 colleges, and 800 secondary schools helped to make this campaign for economic education the success that it was. The League's education-service departments developed for the campaign self-rating charts which enabled students to observe their own growth in achieving wholesome attitudes toward life and living (*School and Society,* Mar. 16).

One of the outstanding and useful Negro schools of Mississippi is the Piney Woods Country School near Jackson (founded 1909). This school has a $250,000 plant, 1,700 acres of well-tended land, and an enrollment of 440 pupils (ranging in age from five to 40 years), drawn from 15 states. It has sent out literally thousands of trained farmers, mechanics, and housekeepers, as well as hundreds of practical and competent school teachers. It has carried far and wide to Negroes and whites "the gospel of good farming, healthful homemaking, sensible religion, and social life." The pupils learn to work with their hands to make a living; they study academic subjects to become adjusted to American life; and they learn to substitute duty and love for superstition and fear. Here is a fusion in education of what the North and the South can do together to help improve life for disadvantaged men, women, and children.

EXTENSION EDUCATION

Negro education in Virginia has gone steadily forward since 1908, when Negro extension work for the improvement of farms and homes got under way. Farm and home agents are employed in Virginia counties that have the largest Negro farm family population. During 1946, some 56 counties employed Negro farm and home agents, both men and women. During the war years, major emphasis was placed on the production and conservation of food and feeds.

During a single year the Virginia Negro agents visited over 21,000 farms or homes and influenced nearly 18,000 farm families in the improvement of their style of living. Some examples follow: In 177 corn hybrid demonstrations, the average yield of corn was raised to 41 bushels per acre on a total acreage of 877; the number of owned farms was increased; houses were painted; yards were beautified; sanitary toilets were built; year-round gardens were increased; and saleable farm products were increased. The Negro agents, year after year, have proved of inestimable value in raising living standards of Virginia Negro farm families (*Virginia Extension News Service*, June).

Sweet Briar College (Virginia) at its Founder's Day exercises in October presented the coveted Algernon Sydney Sullivan Award to Rachel Carter, Negro agent for the Virginia Agricultural Extension Division in Amherst County, "for 25 years of service and outstanding leadership." This award was voted by the College faculty and was given under the auspices of the Southern Society of New York in recognition of "the possession of such characteristics of heart, mind, and conduct as evince a spirit of love for, and helpfulness to, other men and women."

JULIUS ROSENWALD FUND

Edwin R. Embree, president of the Julius Rosenwald Fund (Chicago), in his *Review for the Two-Year Period 1944-46,* stated that the Fund, since its founding in 1917, had spent $20,120,382 on (1) the education of teachers, both Negro and white, for service in the rural schools of the South; (2) scholarship awards to Negroes and white Southerners of special promise; and (3) programs of race relations. During the period 1944-1946 the Fund spent $1,308,576, and of this amount $662,422 was spent through its Division of Race Relations. The Fund provided for the publication of *A Monthly Summary of Events and Trends in Race Relations,* compiled by the Institute for Social Science, Fisk University, and distributed 57,000 books and pamphlets, including *American Negroes, To Stem This Tide, Race and Rumors of Race, Brown Americans, Races of Mankind, Negro in America, Race Relations in Chicago,* and *Race Relations Balance Sheet.*

PHELPS-STOKES FUND

Dr. Jackson Davis, a Virginian who has been connected for 25 years with the General Education Board, was elected president of the Phelps-Stokes Fund (New York) to succeed the Rev. Dr. Anson Phelps Stokes. Dr. Davis was for over 15 years General Field Agent of the General Education Board and is Associate Director of the Board. Dr. Channing H. Tobias, outstanding Negro leader and senior secretary of the Department of Interracial Services of the YMCA, was elected director, to succeed Dr. Thomas Jesse Jones. He is believed to be the first American Negro to be elected the head of a national, educational or philanthropic organization other than those composed mainly or exclusively of Negroes.

LIBRARIES

By Mary C. Tuomey
American Library Association

POST-WAR PLANNING

The interest created in books and libraries continued to increase during the first post-war year. Veterans sought the aid of libraries to inform themselves of developments during the war years—vocational and educational opportunities. The expanded adult education movement influenced trends in library service, and the continuing interest in international cultural exchange intensified the importance of international library relations.

At the June 21, 1946 meeting of the American Library Association Council, a tentative draft of "A National Plan for Public Library Service," prepared by the Committee on Post-war Planning, by Carleton B. Joeckel. chairman, was unanimously approved in principle. This survey of the place of the public library in the American scene, completed after several years of study by members of the Committee, will be published in the spring of 1947. It proposes a realistic plan for the development of library services which will reach all the people of the United States. In its effects, it may be the most significant of all publications of the American Library Association.

Library planning on a state level increased during the year. Commissions studied existing library conditions as a basis for statewide library service in New York, Ohio, Connecticut, and Indiana.

RELATIONS WITH FEDERAL AGENCIES

The Library Development Fund ended its intensive drive for money to support a national legislative program for libraries on June 22, 1946, at the American Library Association's Buffalo Conference, with a total of $88,639. This fund, which was contributed by over 8,000 librarians, trustees, and friends of the library, makes possible the operation of the ALA National Relations Office and its supporting public relations program for four years. The office at 1709 M Street, N. W., Washington, D. C., is under the direction of Paul Howard.

The National Relations program was organized to provide a channel between Washington and the library network, comprising thousands of units in schools, colleges, municipal and state areas throughout the country. Federal relations committees were organized in 44 states to support and interpret the program on state and local levels.

Throughout 1946, the ALA National Relations Office worked with other educational and governmental agencies in support of various pieces of Federal legislation which would "advance and protect the interests of libraries and of the people who use libraries." Legislation of benefit to libraries includes the following:

(1) Libraries have been specifically included among educational institutions eligible to receive surplus property. Under Surplus Property Regulation 14, libraries were ruled eligible for surplus property from three sources: (a) reserves set aside by disposal agencies for state and municipal governments; (b) reserves set aside for certified eligible educational institutions from estimates submitted to R. F. C. by the Office of Education; and (c) from competitive sales.

(2) Public Law 697, signed Aug. 8, 1946 by President Truman, provided temporary housing for educational facilities, including libraries, in institutions carrying on a training program for veterans.

(3) The Army Map Service distributed valuable map collections to approximately 150 libraries.

(4) Regulations providing for the transfer of surplus camp libraries were put into effect. These libraries will be used to extend library service in rural areas. During the year, one library from an Arkansas relocation center was transferred to a state library agency.

The National Relations Office supported the Kilgore Bill which sought to establish a national science foundation, expressed interest in social security legislation and obtained concessions for libraries in legislation which sought to increase postal rates on books.

The Public Library Service Demonstration Bill was introduced into the Senate by Lister Hill of Alabama and in the House by Emily Taft Douglas of Illinois. The bill was approved by subcommittees of both House and Senate and by the full Senate Committee on Education and Labor. The bill will be reintroduced at the session of the 80th Congress. As presented, it calls for annual appropriations of $25,000 for four years to any state with an authorized library administrative agency which establishes policies and methods for utilizing the funds to maximum advantage. Additional funds would be used for demonstrations of library service in areas without an established library program, to improve existing conditions. Federal grants would be discontinued when the service's claim on local and state tax support had been demonstrated.

INTERNATIONAL LIBRARY ACTIVITIES

Since the close of the Second World War, American libraries have helped to replenish European and Asiatic libraries destroyed by war or missing because buildings were closed or staffs disbanded.

Correspondence and surveys of foreign libraries throughout the year indicated the extent of destruction of books and other library materials wrought by the war. Polish libraries will have to start nearly afresh. The University of Louvain in Belgium saved only five of its 571 incunabula and two of all its manuscript codexes, while even Switzerland reported a critical shortage of books.

The Rockefeller Foundation has been active in recent years in connection with the restocking of these European libraries. Substantial grants were made to the International Relations Board of the American Library Association to enable it to accumulate important American scientific, scholarly, and literary publications published in the United States since 1939 for distribution to libraries in war areas; to the Social Science Research Council to build up collections of materials in that field for use of important centers of research in social sciences; to the Committee for the Rehabilitation of Polish Science and Learning to purchase sets of approximately 1,000 books each for ten leading Polish libraries, and other grants to meet special needs, such as, purchase of books for the study of American literature at the University of Oslo.

To answer the need for periodicals published during the war, 5,600 separate sets of 367 periodicals published in the United States from 1939 to 1943 have been shipped to 14 countries. Thirty-five sets of about 750 books of the same years and additional sets of 175 published in 1944, have been sent to 25 countries. These are chiefly the books and periodicals purchased with Rockefeller Foundation funds by the Committee on Aid to Libraries in War Areas. Recent reports of the eagerness of people in allied and enemy countries to see the output of American publishers during the war indicate the goodwill fostered by these shipments.

AMERICAN BOOKS IN LATIN AMERICA

With the inauguration of the Good Neighbor Policy toward Latin America came a great expansion of the use by the United States Government of books as cultural emissaries in foreign countries. Cultural institutes were established or assisted in many Latin American cities. Books were sent as gifts to Latin American libraries, many of which were translated into Spanish or Portuguese. The American Library Association continued to administer libraries in the capital cities of Mexico, Nicaragua, and Uruguay with funds provided by the Department of State.

Library of Congress and ALA representatives participated in the establishment in Peru of a national library association called the Associasion de Bibliotecarios del Peru. Dr. Luther H. Evans, Librarian of Congress, made a formal presentation of about 15,000 volumes to the Peruvian library from the United States Government and from individual friends of Peru to help restore collections destroyed by the fire of May, 1943.

ACTIVITIES OF THE AMERICAN BOOK CENTER

The American Book Center for War Devastated Libraries now functions as the agency for distribution of scholarly publications to libraries of devastated or isolated foreign areas. Expecting to handle from 1,000,000 to 3,000,000 volumes of printed materials in all, the Center has shipped approximately 500,000 volumes overseas from the time of its inception to the present. UNRRA has shipped thousands of cases of books for the Center, the Library of Congress has contributed space for its activities, and the following groups have contributed to the Center's operating budget: the A. F. L., the C. I. O., General Motors. Book-of-the-Month Club, Belgian American Education Association, Belgian War Relief, Church Committee for Relief of Asia, American Relief for Holland, United Yugoslav Relief American Relief for Norway, United China Relief, American Friends Service, Greek War Relief Association Inc., Friends of Luxembourg, Chinese Government, Rockefeller Foundation American Relief for Italy, American Relief for Poland.

U. S. OFFICE OF INFORMATION AND CULTURAL COOPERATION

With the closing of the Office of War Information, many of its information activities were transferred to the U. S. State Department's Office of Information and Cultural Cooperation. This department soon expects to have 86 information libraries in foreign countries and hundreds of smaller collections in the offices of information specialists and cultural attaches. It is now cooperating with the War Department in making some publications available to the peoples of occupied countries. The American Information Center in Belgrade was closed by the Yugoslavian government in the fall of 1946, but reopened later with the permission of the government.

The campaign for funds for continuing operation of the American Library in Paris nears completion. The campaign was under the direction of Mrs. Richard E. Myers, who serves as executive secretary in the New York office of the American Library in Paris, at 420 Lexington Avenue, New York 17, New York.

IMPORTANCE OF BOOKS IN INTERNATIONAL RELATIONS

The importance of libraries in international relations was evidenced by their importance in the program of the United Nations Educational, Scientific and Cultural Organization. Luther H. Evans and Verner Clapp of the Library of Congress and Ralph Shaw, librarian of the U. S. Department of Agriculture, were among the consultants who took part in the preliminary conferences in Paris. In November, Carl H. Milam, executive secretary of the ALA, went to Paris to serve as technical adviser on library matters to the American delegation.

Three projects in full operation have been the Books for Latin America projects of 1944, 1945 and 1946. As a result of these, some 5,573 volumes of American books and periodicals have been shipped to Latin American countries.

Flora B. Ludington resigned from her post as librarian of the American Information Library in Bombay in the spring and was succeeded by Wayne M. Hartwell. Both Miss Ludington and Hartwell attended the All-India Library Conference held in Baroda, late in January. India sent an educational liaison officer to the United States during 1946 to bring about closer relations between libraries of the United States and India.

The King Christian X "Medal of the Liberation" was awarded by the government of Denmark in August, to Miss Dorothy Comins, ALA International Relations Office, for aid to Denmark during the war.

OPPORTUNITIES FOR INTERCHANGE OF IDEAS

International conferences and government missions gave many American librarians the opportunity for interchange of ideas with foreign colleagues. Ralph Ulveling, director of the Detroit Public Library, made a quick survey of library service for the armed forces in Europe at the request of the theater commander and the War Department. Leon Carnovsky, professor of library science at the University of Chicago, was one of an advisory delegation sent to Japan to consult on re-education of the Japanese people. Many Latin American librarians, as well as some from England, China, India, and other countries visited North American libraries during the year.

STATE AND LOCAL DEVELOPMENT

Appropriations for state library agencies and for state aid to public libraries showed material increases throughout the year. Georgia included an additional $50,000 in the Department of Education budget for state aid for rural library service. In Louisiana, aid was increased by $50,000 for the biennium 1946-1948; Maryland received its first appropriation of $20,000 for 1946-1947 as aid to county libraries; New York State increased by $2,000, for the year 1946-1947, annual aid to registered libraries which meet standards set by the regents.

During 1946, Missouri passed legislation which abolished the Missouri Library Commission and created in its place, the Missouri State Library in the State Department of Education. On Oct. 15, a bill appropriating approximately $212,000 in support of this bill was signed by the governor of Missouri. State aid will be allocated under the following provisions according to the new act: 50 per cent of all moneys appropriated will be allocated to tax-supported public libraries on a per capita basis. The remaining 50 per cent will be allocated to county and regional libraries as an establishment grant to newly created county and regional libraries and as an equalization grant to county and regional libraries.

Four Canadian provinces reported progress. British Columbia increased by $4,000 the general grants-in-aid; Ontario voted $105,000 for grants to free public libraries. Grants are based on (a) certification (now formally adopted by the province) and (b) local municipal appropriations giving advantage to those which meet standards of support and service made under the 1946 Public Libraries Act.

Saskatchewan appropriated $6,000 for 1946 for small grants to public libraries and mechanics institutes. The 1946 Regional Library Act granted an appropriation of $5,000 for a regional library supervisor and additional funds for the organization of a regional library demonstration and for a school library supervisor, as well as three $600 scholarships for library training annually.

Several states were still using funds appropriated for the biennium 1945-1947. No state or province reduced its appropriation for its library extension agency or for state aid.

County and regional libraries increased from 725 to 808 during the year. Twenty-six per cent of the entire population is still, however, without library service.

Arizona is now the only state without a library extension agency, while Idaho is the only state which lacks legal provision for county or regional library service.

ADULT EDUCATION

Impetus for adult education gained momentum throughout the year. Five organizations, American Association for Adult Education, National Education Association, American Library Association, Educational Film Association and the National University Extension Division participated in an adult education conference in Detroit in the spring. It marked, according to Mortimer J. Adler of the University of Chicago, the beginning of real exploration of the possibilities of adult education. The five associations agreed to form a joint committee to define principles, policies and practices. Subject fields will be examined one at a time.

Public library interest in building up film libraries and in promoting film use increased. A limited number of public libraries are using films as an integral part of the library's collection of materials. Opinion polls of librarians returning from military service and of several hundred library trustees showed that both these groups believe that public as well as school and college libraries, must accept films as an important educational tool, because of their unique success in military and industrial training. (See "Adult Education," p. 1032.)

LIBRARY SERVICE FOR BUSINESS AND INDUSTRY

The past year saw a great increase in awareness by business of its needs for factual information and in its growing interest in broad community welfare. Late in the year, the American Library Association and several other national library and business groups held joint meetings in Chicago. Illinois, and York, Penn., to explore the possibilities of regional library service to small business and industry. Detroit, Cleveland, Chicago, Indianapolis, and Newark libraries were among the most active in according library service to business.

LIBRARY TRAINING

Throughout 1946, the library profession turned more intensive attention to the progress of libraries in the future and, consequently, to their needs in personnel. The prevailing shortage of librarians appeared to some professional leaders to be a problem which necessitated drastic changes in the present plan of library education.

Basic problems which the library profession faces today are (1) to identify and define professional and borderline professional work in libraries and (2) to determine the education, both general and in the library field. which each type of work requires Joseph L. Wheeler's *Progress and Problems in Education for Librarianship,* prepared at the request of the Carnegie Corporation of New York. intensified the thinking of many librarians on the questions it raised or implied.

Most library schools are engaged in the study of important educational questions or working toward a revision of curricula. A new curriculum became effective at Louisiana in the summer of 1946, which allowed a more flexible program for library students. Columbia continued conferences with consultants and intensive work by the faculty in the revision of basic and specialized programs, and issued a special report, *Education for Librarianship,* by J. Periam Danton.

Special arrangements to admit veterans in the mid-year were effective at Columbia, Denver, Emory, Illinois, North Carolina, and Western Reserve Library Schools. Adjustments in programs to meet individual needs were made possible at other library schools. New scholarships were announced at the University of Minnesota and Drexel Institute, the latter to be awarded to students training for work in special libraries.

Enrollments in the 34 accredited library schools again showed an increase over the preceding year with the prospect of a return to normal numbers of students in 1946-1947; 1,499 students were enrolled in 1946 as compared to 1,032 for the previous year. In the two Canadian library schools, 61 students were enrolled in 1945-1946, an increase of one-third. Admissions at some library schools were affected by the current housing shortage and the unprecedented number of applicants in all university departments.

New directors took office at the library schools of Atlanta University, University of Washington, University of California, University of Kentucky, Simmons College, and College of William and Mary.

In June, 1946, the ALA Board of Education for Librarianship accredited two Type III library schools—New York State Teachers College, Geneseo, N. Y., Department of Library Education, which emphasizes preparation for school library work, and Marywood College, Department of Librarianship, Scranton, Penn.

A few states, notably Massachusetts, made progress toward securing legal certification for librarians, but no laws were enacted. In British Columbia, a system of certification for librarians was put into effect under the law passed in 1944.

The return to more normal travel conditions in 1946 had an immediate effect on in-service training. Many library schools and state library extension agencies resumed or extended their in-service training programs.

Among the library schools, New York State College for Teachers at Albany was responsible for organizing an institute on intergroup education and the library. New York State Teachers College at Geneseo held its annual institute for school librarians in service. A summer refresher course was held at the University of Toronto. The Library School of the University of Denver joined the Colorado Agricultural College in sponsoring the Rocky Mountain Rural Library Institute. Western Reserve University, with the Ohio State Library, conducted an institute for librarians in service. The Graduate Library School, University of Chicago devoted its annual summer institute to the planning of library buildings. Library associations and state library extension agencies in Michigan, New York, Vermont and Wisconsin also continued institutes and workshops.

PERSONNEL PROBLEMS

Personnel problems were given consideration by several state and provincial library associations throughout the year. The New Jersey Library Association increased the salary schedules for its classification and pay plans by 33 1/3 per cent for all but the highest grade of professional service, for which 25 per cent was recommended. The North Carolina Library Association issued suggested *Personnel and Working Specifications for North Carolina Libraries,* and the British Columbia Library Association, *Personnel Specifications for Library Positions.*

Increases in salary were adopted in Classification and Pay Plans by the Civil Service Commission and Public Libraries in Akron, O.; Chicago; Des Moines, Ia.; Indianapolis, Ind.; Kansas City, Mo.; Milwaukee, Wis., and the New York and Michigan state libraries.

In its efforts to raise salaries, the ALA Board of Personnel Administration issued a Salary Policy Statement, adopted by the ALA Council in June, 1946, which raised the national standard minimum salary for professional librarians to $2,100. *The Classification and Pay Plans for Municipal Public Libraries* and *The Classification and Pay Plans for Libraries in Institutions of Higher Education,* both ALA publications, were revised to meet new salary schedules. The ALA Council also adopted a statement on tenure applying to professional members of library staffs. A statement of tenure principles for non-professional personnel is expected in 1947.

GIFTS, GRANTS AND BUILDINGS

Book collections and monetary gifts to purchase books increased the resources of libraries during the year. Among these were: $1,500,000 from Thomas W. Lamont to establish the first undergraduate library at Harvard University; a $100,000 trust fund for the Youngstown Public Library, Youngstown, O., given by Justice John H. Clarke. Income from the bequest will be used to purchase books. The Library Association of Portland, Ore. will receive $2,400 a year from a trust fund established by Thomas Roberts. A $25,000 bequest trust fund was left by Mrs. Lena D. Hesse to the Milwaukee Public Library, Milwaukee, Wis. The Public Library, Monteguina, Ind. received approximately 1,000 volumes from the estate of the late Lula J. Case; this gift also included a collection of famous paintings. The Macalester College Library received nearly 1,000 volumes on American hymnology, the greatest collection of such materials in the United States.

Among smaller gifts were a bequest of $1,500 to the Greenfield Public Library, Greenfield, Ia. from Mrs. Celia F. Holcomb; $1,000 to the Clarksville Public Library, Clarksville, Ia. by R. L. Slimmer; a bequest of $1,000 to the Washington Public Library, Washington, Ia. by Dr. Ludwig Simon; $3,000 to the Bangor Public Library, Bangor, Me. from the estate of Louise Baldwin Thompson; $3,000 bequeathed to the Lynn Public Library, Lynn, Mass. under the will of Walter O. Faulkner, trustee of the library for over 50 years; a $2,500 endowment fund to the Public Library, Waupum, Wis. from the estate of Betty Kennedy.

Gifts of money and funds for library building included $3,700 from the estate of Lucy Rising Rocks bequeathed to Wyoming, Ia. to establish and maintain a library; $4,800 from the A. J. Cross estate bequeathed to Shenandoah, Ia. to be used with the building fund; $10,000 left by Mrs. Mattie Utting to Dodgeville, Wis. to help erect a library building. Over $90,000 left by H. E. Swen to Kahoka, Mo. for the construction of an H. E. Swen Memorial Library to serve Kahoka and Clarke counties. The sum of $25,000 has been given by various donors to Indianola, Miss. for a public library. The Baldwin-Wallace College received a gift of $152,000 from George W. Ritter, an alumnus of the college, for the construction of a modern library building.

Numerous plans are being made for the construction of new library buildings as soon as materials are available. Undoubtedly, the next few years will see an unprecedented growth in modern library building along the lines of the long-range master plan developed and approved by the Detroit Library Commission for that city. Plans made for large construction of library buildings during the war, in most instances, are being delayed by shortages of materials.

AMERICAN LIBRARY ASSOCIATION

Officers for the year 1946-1947: Mary U. Rothrock, Tennessee Valley Authority, president; Paul North Rice, New York Public Library, first vice-president and president-elect; Nell Avery Unger, Library Association of Portland, Portland, Ore., second vice-president; Rudolph H. Gjelsness, University of Michigan, treasurer.

The American Library Association is an international organization, composed of 15,000 librarians, library trustees, and friends of libraries. It was organized in 1876 to promote the foundation and improvement of libraries in the United States and Canada. In June, 1946, the ALA transferred headquarters to 50 East Huron Street, once the home of Cyrus H. McCormick. An International Relations Office is maintained in the Library of Congress Annex, Washington 25, D. C., with Marion A. Milczewski, director. The Association's National Relations Office is located at 1709 M Street, N. W., Washington 6, D. C.

1946 saw the first ALA midwinter and summer conferences since travel restrictions were enforced in 1942. The midwinter conference was held in Chicago while the Association's 65th annual conference drew 2,500 delegates to the Memorial Auditorium, Buffalo, N. Y.

ANNUAL AWARDS

The annual citations for distinguished service as library trustees were awarded to James J. Weadock, Jr., vice-president of the Board of Trustees of the Lima Public Library, Lima, O., and Mrs. Myrtle J. Price of Tuscaloosa, Ala., chairman, of the Alabama Public Library Service Division. The 25th annual Newbery Medal was awarded to Lois Lenski for *Strawberry Girl,* judged to be the outstanding contribution to children's literature in 1945. The 10th annual Caldecott Medal for the most distinguished picture book was conferred upon Maud and Miska Petersham for *The Rooster Crows,* a book of American rhymes and jingles.

PUBLICATIONS

Five periodicals are published by the American Library Association: *ALA Bulletin, Booklist, Subscription Books Bulletin, College and Research Libraries,* and *Hospital Book Guide.*

Among 1946 publications of other

agencies were: Marian C. Manley, *Library Service in Business, Its Place in the Small City; College and University Librarians and Librarianship* (Library Planning Document in the College Field); Mary A. Sweeeny, *Rehabilitation Materials on Today's Problems for Veterans and Civilians;* Dorothea M. Singer, *Insurance of Libraries;* Cincinnati Public Library Staff, *Books for Adult Beginners;* Sidney Ditzion, *Arsenals of a Democratic Culture; A Social History of the American Public Library Movement in New England and the Middle States, 1850-1900.*

Other publications in the library field were: Pierce Butler, *Books and Libraries in Wartime,* University of Chicago Press, 1945; *Library Extension,* University of Chicago Press, 1946; *General Education in a Free Society: Report of the Harvard Committee,* Harvard University Press, 1945; Carleton B. Joeckel, *Library Extension Problems and Solutions,* University of Chicago Press, 1946; Edward Wight, *Evaluation and Revision of the Library School Curriculum,* Peabody Press, 1945; Louis R. Wilson and Maurice F. Tauber, *The University Library: Its Organization, Administration and Functions,* University of Chicago Press, 1945.
